The High School building, at Hastings, Neb., will be heated by steam, Anson & Pratt of that city installing the plant.

The contract for heating and ventilating the Elm street school building at West Roxbury, Mass, has been awarded A. B. Franklin, at the reported price of $3192.

The School Board of Lynn, Mass., have authorized the Committee on Sanitation to expend $1500 for heating and ventilating the Parrott street school house.

C. Steinhoff was recently awarded the contract for the heating apparatus in the main school at West Hoboken.

T. P. Aitkin, Manchester, Conn., received the contracts for heating the Methodist church at Burnside with a furnace and the Oakland school with steam.

A resolution of the Building Committee recommending the placing of a small boiler in School No. 10 to run the ventilating apparatus was adoped at a recent meeting of the Albany, N. Y., School Board.

The Supply Committee of the School Board of Troy, N. Y., at a recent meeting were authorized to advertise for bids furnishing a new heater and repairing an old one in School No. 6.

A local authority says the question of heating the Huntington and Jackson halls, at Lowell, Mass., will need serious consideration in the near future.

The Reading, Pa., City Council recently passed a resolution directing the Police Committee to reconstruct the steam heating apparatus in the City Hall.

Contract for placing a new hot-water heating system in St. Peter's Church at Albany, N. Y., has been awarded to James Hunter.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until August 24, for the labor and materials for a heating and ventilating apparatus in the U. S. Court House, Post Office, &c., building at Scranton, Pa. Drawings and specifications may be obtained at the office of the Supervising Architect at Washington, or at the office of the superintendent at Scranton.

The American Radiator Company, through their New York office, 92 Centre street, are in receipt of orders for the following buildings: Through Baker, Smith & Co., heating contractors, Weschler Building, Broadway and Thirty-first street; Hon. Seth Low's residence, East Sixty-fourth street; Brooklyn Storage and Warehouse Building, Brooklyn. Through E. Rutzler, heating contractor, Rev. E. P. Mahoney's

school, Madison avenue, New York; hotel, Forty-first street and Broadway; Decker Building, Broadway; St. Joseph's Church, Dean street, Brooklyn; Methodist Episcopal Hospital, Seventh street. Through Degnan & Co., the State Insane Asylum at Middletown, N. Y., and the Boys' High School, Putnam and Marcy avenues, Brooklyn. We understand from the American Radiator Company that business is comparatively quiet at present, but there are prospects of a very good fall trade.

WE ARE INDEBTED to the Walworth Construction & Supply Company, 60 Pearl street, Boston, Mass., for a copy of a publication entitled "10 to 1." This curious name, which is familiar to our readers, refers to a treatise on the selection of a house-heating boiler, with a description of the Equator for steam and the Gulf Stream for hot water. Some valuable information is given in the introductory chapters of the book, and then the specific account of the two boilers mentioned is taken up, the text being illustrated by a sufficiency of cuts, showing both general, sectional and detailed views of the apparatus. At the end is a list of sizes, with dimensions and prices, and also a number of testimonial letters. The book is an interesting treatise and will repay perusal.

THE PLANT of Hart & Crouse, Utica, N. Y., is running full and in some departments extra time is made, which manager W. M. Mackay of the New York office says is due to the attractions in the line of Royal hot-air furnaces and hot-water and steam boilers.

PERCIVAL H. SEWARD, engineer of the New York office of the American Boiler Company, will sail for England on the 19th, making a flying trip, as he expects to return early in September.

D. F. MORGAN has left the New York office of the D. F. Morgan Boiler Company to spend a few days at the factory at Akron, Ohio.

THE CRESCENT FLUE RADIATORS, made by T. C. Joy & Co., Titusville, Pa., will be used for heating the new building of the Mutual Reserve Insurance Company at Broadway and Duane street, New York.

THE AMERICAN RADIATOR COMPANY, 111 and 113 Lake street, Chicago, report that they have received another large order for radiators from Germany; also an order for radiators to be shipped to Sweden.

GEO. D. HOFFMAN, 82 Lake street, Chicago, is to supply the steam heating plants for the Endeavor Presbyterian Church, Chicago, and Chas. Byrne's flat building at Englewood, Ill.

JOHN W. MILLS, 100 Lake street, Chicago, is to furnish a Capitol hot-water heater for the lighthouse, Chicago harbor. Also Bolton hot-water heaters for schoolhouses at West Branch, Iowa, and Eau Claire, Wis.

THE ILLINOIS HEATING COMPANY, 88 Lake street, Chicago, report that over 55 contracts for steam and hot-water heating have been taken since March 1. Among these can be mentioned residences of J. B. Earl, St. Louis avenue and Adams street; F. W. Thurston, Forty-first street and Grand Boulevard; E. W. Chase, Washington Boulevard; two residences of Samuel Hall, Garfield Park; three residences of M. D. Hathaway, Garfield Boulevard; apartment building of R. A. Greifenhagen, Dearborn avenue, and South Side Masonic Temple, Indiana avenue and Thirty-first street.

THE M. E. HERBERT HEATER COMPANY, succeeding M. E. Herbert, have removed their plant from St. Joseph, Mo., to Forty-first and La Salle streets, Chicago. The building secured is 75 x 175 feet, and will be used for office, boiler shop, foundry and machine shop.

THE BAKER & SMITH CO., 193 to 197 Van Buren street, Chicago, are to furnish the necessary pipes for the utilization of exhaust steam for heating and for connecting 27 pumps in one of the largest oil refineries in the United States, located at Louisville, Ky. The same firm also furnish the steam heating plant for the McHenry County, Ill., Court House.

THE BOARD OF ALDERMEN of Fitchburg, Mass., recently made an appropriation for heating and ventilating the Day Street School.

VISCHER & CLARK, Cohoes, N. Y., have the contract for the steam heating plant for the new Island School.

AT MINNEAPOLIS, MINN, the hospital Committee of the Board of Charities will alter the Brackett residence into a hospital and a central heating plant. Tunstead & Moore will install the heating apparatus and W. W. Sykes & Co. will do the plumbing work.

A COLLECTION is being made to purchase furnaces for the Congregational Church at Chester, N. H.

DONALD CHISHOLD has the contract for heating the McKeesport, Pa., hospital with a hot-water system.

THE TOWN OF AMHERST, MASS., will continue the work of school ventilation and sanitation. The Amity Street School is to be the next.

E. P. BATES, Albany, N. Y., has been awarded the contract for heating the Granville School building.

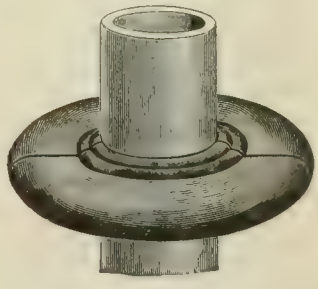
JOSEPH M. STOUGHTON has resigned his position as secretary of the Model Heating Company, but it is possible that he may re appear in the heating business in the not distant future. At least, that is the wish of his many friends in the trade.

Heating Estimate Blanks.

An interesting publication has recently been devised and issued by the Nason Mfg. Company, 71 Beekman street, New York, that will appeal particularly to those who are interested in the steam and hot-water heating trade. The book is a substantial publication of a couple of hundred pages or more and contains estimate blanks for steam and hot-water fitters adapted more particularly for dwellings and apartment houses, small stores and general low-pressure work by either steam or hot water. An introductory note addressed to the steam and hot-water warming fraternity contains some pertinent observations on the value of keeping a record of estimates. Too often this important memorandum is recorded on stray slips of paper, which are destroyed as soon as done with. Furthermore, this haphazard method of estimating often results in the overlooking or omission of important items that may make a difference between profit and loss in the heating contract. This serviceable volume, issued by the Nason Mfg. Company, is a collection of blanks bound in a book 6 x 10 inches in size. At the beginning are blank pages for indexing the 100 estimate forms, giving the name and address of the owner, architect, building, location, price and date. Each two succeeding pages contain the blanks for the estimate, name, kind of building, where located, architect, material of building, date, number of stories, number of rooms and system of warming; following which is a set of blanks for the different stories, giving names of the rooms, dimensions in cubic feet, with columns for the ratio of surface to volume and the square feet of surface, both direct and indirect. The estimate form on the opposite page has the proper spaces for recording the cost of surface, valves, air cocks, pipe fittings, &c., while at the bottom are the other items of heater regulators, pipe connections, hangers, air pipes, &c., and lines for inserting the cost of work, at the end being the quoted price, actual cost, profit, the estimated cost, the date of beginning work, and other important items. The volume is carefully devised, and will, we believe, prove useful even to those fitters who may not install exclusively the Equator or Gulf Stream heaters.

O. K. Pipe Plates.

T. B. Cryer & Co., Newark, N. J., have recently patented the subjects of our illustrations, which are known as the O. K. adjustable floor plate and



O. K. Pipe Plates.—Fig. 1.—O. K. Adjustable Floor Plate.

ceiling plate. The O. K. adjustable floor plate, Fig. 1, is made with a wide flange, to cover an irregular large hole, and is sufficiently arched to set down flat while covering a fitting that projects above the floor. They are made in two parts, neatly joined and held by

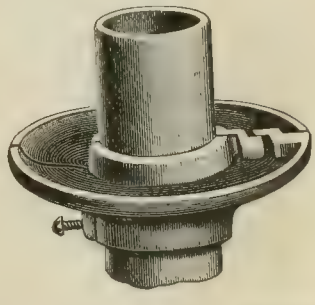


Fig. 2.—O. K. Adjustable Ceiling Plate.

one set screw. The O. K. adjustable ceiling plate, Fig. 2, is made with a wide flange, and in two parts, readily secured to the pipe by a single set screw. Both plates have an ingeniously contrived lug lock, that permits the two parts to be joined around piping that is completed, and are securely held by the one screw. They are cast with a deep mark across the hidden surface, so that the plate can be readily broken to fit close where two pipes come close together. They are made plain and nickel plated, in sizes for pipe from ¼ inch to 6 inches.

World's Fair Exhibits.

GRAND RAPIDS REFRIGERATOR COMPANY of Grand Rapids, Mich., together with the Northern Refrigerator Company of the same city, make a very handsome display of the Leonard Cleanable and the Glacier Refrigerators in the Manufactures Building. Their space is inclosed by an open frame work of oak and brass. Around the top are brass letters attached to fret work panels. The exhibit consists of a great grocer's Refrigerator, restaurant Refrigerators, large and small, domestic Refrigerators, beautiful Sideboards, florist's Refrigerators, &c., the entire exhibit comprising some 16 samples. The announcement is made that all these goods were taken from regular stock and not manufactured for exhibition purposes. Nevertheless, they are exceedingly handsome, and thus demonstrate the superior workmanship which is the standard set up by these companies. All are made of hard wood and are elegantly polished and finely carved. The Hardware used is of the makers' special designs. The hinges are of open work in solid brass, while the locks are solid brass, with double lever catches which fasten the doors at the top and bottom as well as in the center.

J. R. BRYANT & Co. of Crawfordsville, Ind., exhibit numerous specimens in Galvanized Iron and Copper of their Crest Tile Conductor, a combined cresting, ridgeboard and electrical conductor. This is made of a sheet of metal folded flat to form the top, while the sides are widened and shaped to fit the form of the comb of the roof. The cresting thus made extends some 6 inches above the roof and is cut in ornamental patterns.

THE NEW JERSEY WIRE CLOTH COMPANY of Trenton, N. J., make a very practical exhibit in the Manufactures Building. They have erected on a portion of their space a small building, with floors, walls, partitions and ceiling constructed with wire lathing. The floor is laid on steel beams, covered with wire lath, and consists of concrete, which is as firm and substantial as though it were brick laid on solid earth. On one side is a wire brick partition, with a portion uncovered by plaster. The same method is followed in showing the construction of a solid hard plaster partition on wire lath, a fire-proofed column on corrugated wire lathing, a fire-proofed column on patent stiffened wire lathing, and a stud partition with the same kind of lathing. Grouped inside, on top and round this structure are rolls of Wire Cloth, Poultry Netting, Fencing and other fabrics of woven wire. An exhibit is made of fire-proof scenery for theaters, the curtain being made of Wire Cloth, as well as the accessories. On these have been painted in oil designs and landscapes of a high order of merit, illustrating their perfect adaptation to this purpose.

THE GILBERT & BENNETT MFG. COMPANY, Georgetown, Conn., New York and Chicago, are distributing a souvenir, this being the seventy-fifth anniversary of the company. Views are given of their exhibits located in the Manufactures Building, section Q, block 3, and in the Horticultural Building under the dome; also, of their factories, stores and offices. A portion of the book is devoted to an interesting explanation of Netting and Fencing.

KEEN & HAGERTY of Baltimore, Md., have arranged their exhibit of pieced and stamped Tinware on a large rack with shelves on both sides, as their space is narrow, with an aisle on both front and rear. The display is arranged effectively, comprising a large number of kitchen utensils, decorated Bathtubs, decorated Chamber Sets, Oil Tanks, hospital specialties, Water Coolers, &c. They manufacture the Columbian Rotary Steel-faced Nutmeg Grater, the Columbian Pie Plate with a corrugated bottom, the Wagandt soldering system and other specialties.

THE UNITED STATES WIRE MAT COMPANY of Decatur, Ill., display their products in a glass case of special design, with large plate-glass sides and a plate-glass roof. In this a great variety of Wire Mats are shown in rolls and flat. The peculiarity of the Decatur Mat is that it is composed of separate links, so that it can be almost as tightly rolled as a piece of carpet. This flexibility is a feature that makes the Mat accommodate itself to inequalities in a floor, so that it will always lie perfectly flat and yet will not curl up at the edges. It is made in any length and any width. When furnished in rolls of long lengths, pieces can be cut off as desired, thus avoiding the necessity of a jobber carrying in stock a great number of separate Mats of various sizes to accommodate his customers. The company are exhibiting in the Manufactures Building.

GRISWOLD MFG. CO., Erie, Pa., make an admirable display of their Erie hollow ware at the World's Fair. Large showcases surround three sides of the space. In these cases are arranged highly polished specimens of Skillets, Pans and Pots, also Waffle Irons in several sizes, Cake Bakers of many patterns, Broilers, Lid Lifters in numerous designs, Iron Holders, Mail Boxes, &c. Nickel plated Skillets are displayed in separate compartments in the front of the other cases. The extreme top is bordered with cold-handled Tea Kettles, some galvanized and others tinned. A sign composed of miniature Skillets stretches across the rear of the top. The railing in front is composed of miniature Tea Kettles strung on chains. Columns on each side of the entrance support nickel plated fire sets, consisting of a stand with Shovel, Coal Tongs, Poker and Brush. The display is made in the Manufactures Building.

The Gatling machine gun has been still further improved by the adoption of an improved feed. With this new feed the motion is positive, and there is no failure in any part of the movement, while the cost has been reduced from $2.50 for the old feed to 2 cents for the new device. Another advantage is that a much larger amount of ammunition can be carried with the gun than by the old way. The gun can be fed by the new arrangement with the greatest rapidity. With it it has been fired 3120 times in a minute, and when turned by a small electric motor attached to the breech it can be fired 5000 times a minute. This improved feed was developed and applied to the gun used in the United States Government test in the shops of the Dwight Slate Machine Company of Hartford, Conn. The patents are in the name of two of the employees of these shops, and will be assigned to the Gatling Company. The Dwight Slate Machine Company are now engaged in adapting an electric motor to operate the feed, the electrical part of which is made by the Eddy Electric Company.

Latest official reports announce the existence of 50 derelict vessels floating in the Atlantic Ocean that are regarded as dangerous to navigation.

Prize Competitions.

Prize Competition No. 27 (Reopened).

SUBJECT:

Local Associations of Merchants.

This competition closed July 8, but in view of the exceptionally few replies which have been received from the trade and the importance and practical nature of the subject, we reannounce it as above, and extend the time up to which responses will be accepted to September 16.

The formation of local associations has been found feasible in many places for the purpose of securing more friendly relations among competitors and reaching an understanding in regard to matters of common interest. Among the good results referred to as coming from such associations are the following: Overcoming petty jealousies; cultivating a spirit of fraternity; listing of undesirable customers; an understanding in regard to time of presenting bills; putting in operation early-closing movements; agreement as to the prices at which goods are to be sold; mutual accommodation in supplying goods which one merchant may be temporarily short of, &c. The subject is thus evidently a broad one and of a good deal of practical interest. In discussing it the following points are suggested:

Whether it is desirable to have such associations;

How such associations may be organized;

The objects to be accomplished by them.

It will also be of interest to have any information in regard to the practical working of such associations.

This competition will remain open until September 16, 1893.

Those intending to compete are reminded that it will not be necessary to write long essays, but that comparatively brief and business-like answers will be favorably regarded as meeting the purpose for which these competitions are announced.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

The prizes will be awarded for answers which, in the judgment of the Committee of Award, are most suitable for publication and of the most general interest.

The committee to whom the papers in Competition No. 22 were referred have awarded the prizes as follows:

First prize to A. H. HOPE.

Second prize to CHAS. S. COOM.

Third prize to W. F. VAN WINKLE.

TIN PLATES.

Imports of Tin and Tin Plates.

The following figures, compiled from official Treasury statistics, show the importations of tin and tin and terne plates through the port of New York for the month of June and the twelve months of the last two years :

	Month ending June 30, 1893.	1892.
Tin in bars, pigs, &c., lb.	9,320,785	5,819,567
Tin in bars, pigs, &c....	$1,859,822	$1,174,068
Tin plates, terne plates and taggers' tin, lb...	60,220,956	58,268,871
Tin plates, terne plates and taggers' tin.....	$1,666,824	$1,643,902
	Twelve months ending June 30, 1893.	1892.
Tin in bars, pigs, &c., lb.	61,076,464	43,908,652
Tin in bars, pigs, &c....	$12,358,999	$8,667,870
Tin plates, terne plates and taggers' tin, lb....	628,425,902	422,176,202
Tin plates, terne plates and taggers' tin.....	$17,565,640	$12,315,562

SCRAP.

RECENT ADVICES from England anticipate that the general strike of coal miners will seriously affect the makers of tin-plate bars in Great Britain, which will in turn affect the Welsh tin-plate mills and reduce their output, diminishing at the same time the demand for pig tin.

A PRESS DISPATCH from New Castle, Pa., states that it is officially announced that the New Castle Tin Plate Company's steel works will start up next week, the new tin-plate mill commencing operations at the same time. The sheet mill is now running full time.

THE NEW ZEALAND TIN FIELDS at Stewart Island, about which such promising reports were made a few years ago, have been disappointing, the quantities of ore found being insufficient to pay working expenses, in the face of the extreme difficulty in obtaining water.

THE MOST COVETED HONOR among the British Volunteers has this year been won by a Welsh tin plater—Sergeant W. T. Davies of the 1st Welsh Volunteer Battalion--who carried off the Queen's Prize at the annual shooting tournament at Bisley. Mr. Davies is a rollerman at the South Wales mills, Llanelly. Messrs. Morewood & Co., the proprietors of the mills, gave a banquet to all their workpeople in honor of the event.

PART OF THE PLANT of the United States Iron & Tin Plate Mfg. Company, at Demmler, Pa., manufacturers of tin and terne plates and iron and steel sheets, was put in operation on Monday, August 7. Work was resumed in order that the firm could finish up some old orders and get out some new ones for which their customers are pressing them. As to whether the plant will continue in operation right along has not as yet been determined. Tin plates are all that are being turned out, and were it not that the firm are in receipt of orders from old customers who will not use any other brand, their plant would be idle. In view of the great depression now existing in business circles, it is certainly very complimentary to the above firm to be able to state that they have been compelled to start up their works in order to meet the demands of their customers for tin plates, many of whom will not use any other brand.

THE SOMERTON TIN PLATE WORKS of Somers Brothers, Brooklyn, N. Y., are closed for regular repairs, and because the general trade depression has made a short pause in production desirable. The works will be started again full on September 1. Messrs Somers are making bright tin plates for stamping purposes, the greater bulk of which are used at their own tin-box factory, although the firm find a ready sale for all plates produced beyond their own requirements. Trade has been dull for some time, but the firm have experienced some increase in the volume of orders and inquiries during the past week.

UNDER DATE of the 2d inst. the following press dispatch was sent out from Elwood, Ind. : "Information reached here this evening that the tin-plate factory at Atlanta, Ind., south of this city, had passed into the hands of the receiver. Operations were suspended this morning and the works locked up. The superintendent, Enoch Stanford, was formerly superintendent of the American Works, north of this city. He, together with M. P. Elliot of Kokomo, was largely interested in the Atlanta plant, which has been in operation six months and was apparently prospering. Particulars as to the cause cannot be obtained this evening, but it is ascribed to dull times and financial stringency."

SHEET MILLS NOS. 1, 2, 4, 5 and 7, the bar mill and one heating furnace in the works of the United States Iron & Tin Plate Mfg. Company, at Demmler, Pa., were put in operation on Monday, the 7th inst. These departments comprise more than one-half of the entire works and give employment to about 300 men, and it is stated that within a short time the balance of the plant will be put in operation.

MEURER BROS. COMPANY, Brooklyn, N. Y., issue a circular letter to the trade, directing attention to their several brands of roofing tin. Prominent position is given to the Meurer roofing plate, which is described as made from a very superior quality of steel, carrying a very heavy coating and made by the genuine palm oil process. The other roofing plates referred to are the Flushing and Pullman, the features of which are noted.

IN SPITE OF THE SEVERE DEPRESSION in business circles everywhere, and the very light demand for goods, the McKinley Tin Plate Company, Wilkinsburg, Pa., are meeting with a good demand for their various brands of redipped roofing plates. This firm have just placed on the market a new brand of roofing plate, which they have termed Wilkinsburg Redipped, and for which strong claims are made. This is claimed to be a hand-dipped plate, and after being dipped, it is subjected to a process which insures even coating on every part of the plate, and consequently a perfectly smooth surface. Considerable of this plate has already been put out, and it is said to have given entire satisfaction in every instance. The design used by this firm on their letter heads is unique and original, and is bound to attract attention. A faithful likeness of Wm. McKinley is shown, and immediately under is a British lion borne to the ground by the weight of some dozen boxes of tin plates, each bearing the imprint "McKinley." The fact that American tin plates are fast crushing out the imported article is brought out clearly and forcibly, and the design reflects considerable credit upon the originator. The business of this firm has grown very rapidly during the past two years, and they attribute it to the fact that they have always aimed to turn out first-class product that will give entire satisfaction. The continued growth of their business would indicate that their efforts in this direction have been successful.

N. L. CORT & Co., importers of tin, tin plate and other metals, at 245 Water street, New York, have made an assignment to Frederick G. Dow, lawyer, of 192 Broadway, giving seven preferences for money loaned, aggregating $34,425. The liabilities are stated to be about $350,000, while the amount of the assets is not yet known. The latter consist of merchandise, bills receivable, outstanding accounts and property to a large amount. The failure is due to depreciation in the price of metals, failure of customers to carry out their contracts with the firm, and the general financial stringency. The firm have been prominent in the metal trade for the last 30 years, and have a high reputation. It is hoped that a satisfactory arrangement may be made with the creditors, and that the firm may be able to resume business.

A MOUNTAIN has been made out of a molehill in the accounts recently published of strikes of workmen and suspension of operations at the works of the Morewood Tin Plate Company, at Elizabethport, N. J. The works have been running as usual, except for the temporary stoppage of one terne stack on account of dullness in the demand for roofing plates. The firm experienced some difficulty on the score of wages with a number of boys employed in the tin house, but the dispute has been adjusted.

The new Forestry Commission in New Hampshire is doing vigorous work in educating the farmers and lumbermen in regard to the extent and value of their forests and the best methods of treating them. It is believed that the New Hampshire forests are worth more for lumbering purposes than all the farms in the State are worth for agricultural purposes.

New York city has $16,000,000 invested in school sites and buildings. This is considerably more than the annual expenditure on education of Italy and Spain combined.

PLUMBING and GAS FITTING.

Proposed Plumbing Laws for Montreal.

We print below the text of an ordinance for the regulation of plumbing, which is proposed for adoption in the City of Montreal :

SECTION 1. All plumbing and house drainage in the city shall he made and constructed in accordance with the following rules, which shall be binding on all parties concerned :

(1)—No drain or plumbing work shall hereafter be made unless plans, drawings and a description of the same shall have been previously deposited by the proprietor or his representative in the Health Office at least eight days before the commencement of the work, and unless such plans and drawings shall have been approved of by the authorized officer; and in case of repairs or alterations affected by sanitary regulations, notice shall be given to the Health Department within 24 hours;

(2)—No part of the work shall be covered or concealed in any way until after it has been examined and approved of by the inspector; and notice shall be given to the Health Department when the work is sufficiently advanced for such inspection;

(3)—The Water Department shall refuse to turn on the water unless the demand for the same is accompanied by a certificate of the inspector, to the effect that the work has been inspected and found to be in accordance with said rules;

(4)—The material used shall be of good quality and free from defects, and the work shall be executed in a thorough and workmanlike manner;

(5)—The arrangment of the soil, waste and ventilation pipes shall be as direct as possible;

(6)—The soil, drain, waste and ventilation pipes shall, if practicable, be at all times exposed to view ready for inspection and for convenience in repairing;

(7)—When necessarily placed within partitions or recesses of walls, soil, drain, waste or ventilation pipes shall be covered with wood work so fastened with hinges, or round-headed screws, as to be readily uncovered;

(8)—Every house or building shall be separately and independently connected with the street sewer, in front of such house or building, or with such other sewer as shall be designated by the Board of Health;

(9)—Every house drain shall be of iron, with a fall of at least ¼ inch to the foot, and no joint shall be made directly under the wall of the house; moreover, where water closets discharge into it, it shall be at least 4 and not more than 6 inches in diameter, and be laid in a straight line if possible. All changes in direction shall be laid with curved pipes and all connections with Y-branch pipes and curved bends;

(10)—Every such drain put in and covered without due notice to the Health Department shall be uncovered for inspection within 24 hours, if required by the inspector;

(11)—No brick, sheet metal, earthenware or chimney flue shall be used as a sewer ventilator, or to ventilate any trap, drain, soil or waste pipe;

(12)—Soil pipes shall be of cast iron of the weight specified in sub-section 20, and shall extend at least 2 feet above the highest part of the roof or coping, light, shaft louvers, window or other opening; they shall be of the same size throughout, and in no case shall they be less than 4 inches in diameter; no cap or cowl shall be affixed to the same;

(13)—Soil, waste and vent pipes in an extension shall be carried above the roof of the main building when they are closer than 20 feet to the windows of the main building or adjoining houses;

(14)—The vent pipe from the horn of a water closet shall be required only when the closet is at a distance of 15 feet from the main ventilation pipe of the drain;

(15)—Rain water leaders shall not be connected with sewers unless by special permission of the Board of Health;

(16)—Joints of sewers and soil pipes shall be gas and water tight;

(17)—When no water closet exists, ventilated in accordance with the rules aforesaid, the main waste pipes shall be of lead or iron of the weight specified in sub-section 20, and shall be not less than 2 inches in diameter unless there are more than four sinks, in which case the size shall be 3 inches in diameter ; and every such pipe shall be continued full size through the roof in the manner prescribed for soil pipes ;

(18)—When lead pipes are used to connect fixtures with vertical soil or waste pipes, or to connect traps with vertical vent pipes, they shall not be lighter than 6 pounds sheet lead to the foot;

(19)—There shall be no traps in connection with vertical soil or waste pipes, unless by special permission of the board of health;

(20)—All pipes shall be sound and free from holes or cracks;

(21)—The following weight per lineal foot shall be accepted as standard :

Iron Pipes for Plumbing Work.

2-inch, 4 pounds per lineal foot.
3-inch, 5 pounds per lineal foot.
4 inch, 9 pounds per lineal foot.
5-inch, 12 pounds per lineal foot.
9-inch, 15 pounds per lineal foot.

For Drain Work.

4-inch, 12½ pounds per lineal foot.
5-inch, 16 pounds per lineal foot.
6-inch, 20 pounds per lineal foot.

Lead Pipes for Waste Sink Pipes.

2-inch, 10 pounds per lineal yard.
4-inch, 15 pounds per lineal yard.

Lead waste pipes, bends or cesspools shall be equal to not less than 6 pounds per square foot of sheet lead ;

(22)—The fittings used in connection with such pipes shall correspond with them in weight and quality ;

(23)—No tar-coated cast-iron pipes shall be used ;

(24)—The plumbing work shall be tested by the inspector in the presence of the plumber (when the latter is required to be present) with the peppermint, smoke, water or any other test approved by the Board of Health ;

(25)—When defective pipes are discovered, they shall be removed and replaced by sound pipes ; defective joints shall be made tight, and every part of the work in which defects are found shall be made to conform to the present rules ;

(26)—Joints in iron drain, soil and waste pipes shall be so filled with oakum and lead and hand calked as to make them gas tight, and they shall not be painted, varnished, tarred or puttied over until after inspection, unless the inspector does not signify his approval or disapproval of the work within 36 hours after the Health Department shall have been notified that the work is ready for inspection; the said joints may also be screwed joints; should the work prove to be satisfactorily executed in the judgment of the inspector, he shall grant a certificate to that effect to the person concerned;

(27)—All connections of lead with iron pipes shall be made with a brass or copper sleeve or ferrule of the same size as lead pipe, put in the hub of the branch of the iron pipe and calked with lead; and the lead pipe shall be attached to the ferrule by a wiped or overcast joint;

(28)—All connections of lead pipes shall, where practicable, be by wiped joints;

(29)—No tile pipe shall be connected with the soil or waste pipe unless the same be provided with a flange to admit of a proper connection being made;

(30)—Every water closet, urinal, sink, basin, wash tray, bath and every tub shall be separately and effectively trapped. This rule shall apply to a set of tubs, but only one trap shall be required for the set;

(31)—The connections between iron and tile pipes shall be made with the best Portland or Roman cement, or by such other mode as may be approved of by the board ;

(32)—Traps shall be placed as near the fixtures as practicable, and in no case shall they be distant more than 2 feet from the fixtures ;

(33)—There shall be only one trap under the water closet, and that immediately beneath the same ;

(34)—All waste pipe fixtures other than water closets shall be provided at the inlet of such fixtures with strong metallic strainers to exclude from such waste pipes all substances likely to obstruct them ;

(35)—In no case shall the waste pipe from a bath, tub or other fixture be connected with a water-closet trap;

(36)—Overflow pipes from fixtures shall in every case be connected within the inlet side of the trap, and above the water;

(37)—Drip or overflow pipes from the safety pan under water closets and other fixtures, or from tanks other than those of water closets or refrigerators, shall be made to run into some place in open sight ; and in no case shall any pipe be connected directly with the drain, waste or soil pipe ;

(38)—Water-closets apartments shall open to the outer air, or be ventilated by means of a window, shaft or air duct, or by a vent shaft to the chimney ;

(39)—Interior water closets shall in no case be supplied directly from the city reservoir supply pipes ;

(40)—In tenement houses containing more than one family there shall be one water closet for each family and a separate cistern for each closet; in other houses, however, a group of closets may be supplied from one tank; but not water closets on different floors;

(41)—The overflow pipes from water-closet cisterns shall discharge into an open sink, or the basin of the water closet, or where its discharge will attract attention and indicate whether waste of water is occurring into the soil or waste pipe or into the drain;

(42)—Valves must be so fitted and adjusted as to prevent wasting of water;

(43)—No privy vault or cesspool for sewerage shall be permitted in any part of the city where water closets can be connected with a public sewer in the street ; when no sewer exists in the street a permit for a temporary privy may be granted by the Board of Health ; and in such case it shall be water tight, of a capacity of 45 cubic feet ; the sides and bottom shall be constructed of cemented brick 12 inches in thickness and well cemented inside ; such vault may be constructed of cast iron, the shape or form of which shall be either circular or oblong, without angles, and with a concave bottom ; it shall be provided with a ventilation pipe at least 4 inches in diameter, extending from the pit through the roof, sufficiently high as to prevent inconvenience to occupants of neighboring houses ; the seats shall have a tight-fitting cover ; it shall have an aperture opening exteriorly to allow of cleaning by pneumatic process, such aperture to be 2 x 1½ feet in size, or else the flooring shall be air tight and shall have a tightly-fitting trap door communicating with the pit ; the top of the vault shall be 1 foot above the level of the ground ; nothing shall be put into such pit except human excreta ; privies shall be located at a distance of 20 feet (or more according as the Board of Health may deem necessary) from any house or street; they shall be emptied when the contents reach to within 18 inches of the top of the vault, or when judged necessary by the Board of Health, by persons appointed by the board ; no offensive smell or gases shall be allowed to escape therefrom. But in no case shall a privy be allowed within the walls of a dwelling house;

(44)—No steam exhaust blow-off pipe shall connect with a sewer or any house drain, soil pipe or waste pipe ; such pipe must discharge into a tank or condenser ;

(45)—Cellars shall not be connected with the house drain unless necessary, and by special permission of the Board of Health, and according to plans approved of by the board ;

(46)—A sub-soil drain shall be provided

when necessary, and shall be constructed and trapped to the satisfaction of the Board of Health ;

(47)—No trap shall be permitted between the house drain and the public sewer, unless by permission of the Board of Health ; conditionally, however, that such trap shall have a handle-hole for cleaning purposes, and a fresh-air inlet pipe, the whole as may be decided upon by the Board of Health ;

(48)—Drains in yards shall, in all cases, be trapped below frost; that is to say, 4 feet at least under ground;

(49)—In the case of privy vaults now drained into a common sewer, they shall be isolated by means of suitable traps placed below frost and according to instructions from the Board of Health;

(50)—In the case of a new house being built or one already existing being repaired, wherever there is a public sewer in the street, a water closet shall be put in, to the exclusion of privy pits;

(51)—The inspection of drains as well as the inspector of drains shall be under the exclusive control of the Board of Health;

Sec. 2. The word "board," wherever it occurs in this by-law, means the Board of Health of the city of Montreal; and the word "inspector" means the inspector appointed by the said board to carry out the provisions of this by-law;

Sec. 3. Any person contravening any of the provisions of the present by-law shall be liable to a fine, and in default of immediate payment of the said fine, and costs, to an imprisonment, the amount of said fine and the term of said imprisonment to be determined by the Recorder's Court, at its discretion ; but the said fine shall not exceed $40, and the term of imprisonment shall not exceed two calender months ; the said imprisonment, however, to cease at any time before the expiration of the period fixed upon by the Recorder's Court, on payment of said fine and costs; and where the infraction is continuous, such infraction during each day shall constitute a separate offense.

We are in receipt of the following criticism upon the proposed ordinance from one who is more than ordinarily familiar with plumbing matters and who recently was in Montreal for several months :

From the unusually high death rate in Montreal we conclude that the passing of a plumbing by-law cannot be too soon accomplished. It is a matter of astonishment that such a progressive city, as we were somewhat surprised to find it, has been so long without what all "up to date" cities on this continent have had on their statute books for years. The proposed laws are by no means stringent, but will do for a beginning ; and we have no doubt ere long they will add clauses requiring the registration of plumbers after examination. This should not be a difficult matter, or a hardship, as the government of the province sustains a fairly efficient plumbing school in the city.

Clause 1. Latter part calling for notification of Health Department, in case of repairs or alterations, is good if it can be enforced, which we doubt ; and it is always unwise to have laws that cannot be enforced and has the tendency to bring the authorities into contempt.

Clause 3. Is an excellent rule and should be easily enforced and will help out No. 1.

Clause 10. Should be made imperative. All drains should be inspected, and the inspector should have no option. There should be no "if," except the "if" it is right it must be done.

Clause 14. We do not see why 15 feet should be allowed to exist unventilated. All dead ends must be avoided in good plumbing work, and if the closet trap is liable to syphonage, being nearer to the main stack of soil pipe than 15 feet will not prevent it.

Clause 15. In most cities it is compulsory to connect the rain-water leaders with the sewers, due regard being taken as to their proper trapping. The rush of water from such pipes flushes the sewers in an admirable manner.

Clause 17. Our Montreal friends seem to still stick to the English practice of using lead waste pipe, long ago discarded in American practice, except for short special connections.

Clause 19. We cannot conceive the object of this clause. Traps are never required on properly constructed lines of vertical soil pipes.

Clause 24. It would be better to have some definite method of testing decided upon ; then the plumber would know exactly what to do in the way of preparation for the test.

Clause 26. Is not definite. If the inspector fails to put in an appearance for 36 hours the plumber can then paint and putty and cover up defects. We can readily conceive how an understanding between the plumber and the inspector would defeat the object of the by-law. The judgment of the inspector should have nothing to do with the question. Decide upon a definite test and mode of fitting, and if the pipes stand the test and are properly fitted, the certificate follows.

Clause 29. We presume the reference to tile pipes refers to outside drains.

Clause 30. No provision seems to be made for preventing the syphonage of traps.

Clause 33. We see no objection to more than one trap provided proper means are taken for thorough flushing and ventilation.

Clause 36. Overflows are best connected into the dip or seal of the trap, thus preventing a circulation of air through the overflow pipes, which are often foul.

Clause 43. Permits the existence of that abomination, the privy pit. In a rapidly growing city it is sometimes necessary as a temporary expedient that some such fixture be erected, but as soon as water and sewers are provided they should at once be done away with.

Clause 49. Allows the existence of privy pits drained into the common sewer. If there are proper sewers, do away with the pits.

Clause 50. Is an acknowledgment of the superiority of the water closet over the privy pit. Then why allow any pits, as in clause 49 ?

TRAPS AND VENTS.

On Thursday evening, August 3, at a meeting of the master plumbers of Newark, N. J., it was decided to call the organization the Master Plumbers' Association of the City of Newark. They then adopted the regulations which govern the association in Brooklyn, N. Y., with the few changes necessary to fit them to their local requirements.

James K. Biglan, Doylestown, Pa., has been awarded the contract for plumbing the new residence of the Rev. Wm. E. Gell.

The plumbing, repairing and setting new water closets in the Post Office at Augusta, Maine, will be done by A. D. Ward.

The plumbing and gas-piping contracts for the Government barracks at Plattsburg, N. Y., are to be awarded soon.

An effort is being made in Providence, R. I., to have the Board of Aldermen pass satisfactory plumbing regulations.

Bids are invited on plumbing the first ward school building at Houston, Texas.

Bradley & Brigham, Marlboro, Mass., are doing the plumbing in the residences of Wm. King and Wm. R. Dee.

Higgins & Co. are a new firm of plumbers at Springfield, Ohio, who succeed Higgins, Weaver & Co. Wm. F. Flynn, a practical plumber of 20 years' experience in Cleveland, Ohio, enters the new firm and will superintend their work, having done the plumbing in some of the largest commercial and residence buildings at his old home.

Elias Berla, president of the Master Plumbers' Association of Newark, N. J., recently enjoyed a visit from Louis Gasser, a former employee in a plumbing shop started by him at El Paso, Texas, which is now run by J. Simons, who bought the business after it had been established three years.

The contract for the plumbing in the new hospital for contagious diseases in Boston was awarded Henry Hussey & Co. of the same city. The price reported is $10,000.

The plumbers' union at Nashville, Tenn., have called off the strike that has been running there for four weeks, but give no reason for the action.

Benjamin Hyde, Chicago, bid $46,000 and will do the interior finishing and plumbing in the Government building at Duluth, Minn.

Frank Lyman will do the plumbing in the new post office at Sacramento, Cal.

Vickers & Brooker, 129 State street and 29 Commercial avenue, Binghamton, N. Y., are extending a local invitation to leave orders for plumbing, steam and hot-water heating, to secure good work.

On being shown the plans for the plumbing work in a large hotel in New York City by Henri D. Dickinson of the Department of Buildings, Dr. Elgin R. L. Gould, expert of the United States Department of Labor, paid a high compliment to the system of plumbing in vogue in large buildings in New York, saying that it was unsurpassed in any other country. Dr. Gould has made a thorough investigation of such systems, and is now engaged in examining into the question of housing working people in large cities.

J. I. Weston will do the plumbing work in the new McKey block, at Exeter, N. H.

Anson & Pratt, plumbers, Omaha, Neb., report a good trade and a good outlook.

Mullarkey & Senior were awarded the contract for plumbing the Nathan Littauer Hospital, at Gloversville, N. Y., the steam heating contract going to Jacob V. Vrooman's Sons, Schenectady.

Talbot & Co., plumbers, at Lynn, Mass., were recently damaged by a storm which flooded their shop with 2 feet of water.

Locke Bros., tinners and plumbers, have moved into their new shop on Spring street, Williamstown, Mass.

The Board of Aldermen of Providence, R. I., recently passed an ordinance providing for an inspector of plumbing and the regulation of drainage and plumbing.

O. D. Peck, secretary of Peck Bros. & Co., Chicago, has gone East for a few weeks' vacation. A. D. Sanders, manager of the Chicago branch of Peck Bros. & Co., has returned to that city from a visit East.

The Board of Experts now sitting at the Navy Department to select a design for a submarine boat will visit Chicago to witness trials of the Baker and the Holland boats, in order to reach a definite conclusion as to their respective merits.

STOVE TRADE NOTES.

The Future of the Hot-Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

INTEREST OF ARCHITECTS.

In a previous article I referred to the growing interest taken by architects in the subject of hot-air heating, but stated that as yet this interest was confined to a very small percentage of the profession. It seems at most incredible that for years the architect has been the worst foe to progress in hot-air heating. He has persisted, in season and out of season, in obstructing the work of the hot-air furnace contractor, and all but nullified his efforts to please his patrons. The architect in the preparation of plans has ignored the furnace contractor and compelled him to do his work under the most unfavorable conditions, drawing plans without reference to the heating, locating registers in the most undesirable places, and, worst of all, rendering no assistance to the contractor when the work of installation once began, and endeavoring to make the contractor do impossible things on pain of a forfeiture of his contract. In too many plans no consideration is given to the heating until the roof is on and the partitions are all set, and then the contractor is supposed to get in his pipes without injuring the building. He is ordered to put the register in a chamber 12 feet from a stack, and when he attempts to carry out the order the architect refuses to allow the joists to be cut, and several turns and angles are the inevitable result, and when the architect is advised that said register cannot deliver warm air (under the unfavorable conditions) to heat the apartment the architect refers him to the specifications, which state that contractors must guarantee to heat each room to 75° in the coldest of weather, and threatens to withhold settlement until the guarantee is satisfied. Then, after the register is in, Mrs. Jones, the wife of the owner, decides that said register is in the only place in the room where her dresser can stand, and, therefore, the register must be moved, and as the floor is laid and walls plastered more angles and turns are used, and the change is made at the expense of the hot-air contractor. I have had exactly such an experience in more than one case, and other dealers have doubtless suffered like injustices in silence, but I am glad to note that in many cases architects are showing a desire to learn something of the principles of hot-air heating and a disposition to consider the same in the preparation of plans. I have been frequently called into consultation by architects during the past two or three years when the heating of some building was being discussed, and have noticed a marked change in the methods in vogue in handling that part of the work. It is still almost impossible to get an architect to so write his specifications as to compel the contractors to take cognizance of the hot-air heating and carry out their work so as to provide the necessary channels and passages for the pipes, but if repeated efforts are made by furnacemen to have some such provisions incorporated into the specifications of the architects in whose offices they practice I am sure the end will be accomplished in due time. I suggested this method of handling this matter in an article in one of the trade journals some time since and have received a number of letters on the subject since.

(To be continued.)

Some Special Points About Garland Stoves.

The catalogue just issued by the Michigan Stove Company of Detroit, Chicago, New York and Buffalo is one of the most complete ever prepared by any stove house. It contains a great deal of fresh material, giving numerous details regarding Garland stoves and ranges in addition to the usual cuts illustrating the goods manufactured. The methods adopted in this catalogue are excellent, and we herewith reproduce some of the cuts used, together with a portion of the explanatory remarks.

Fig. 1 illustrates the system employed in securing aërated ovens.

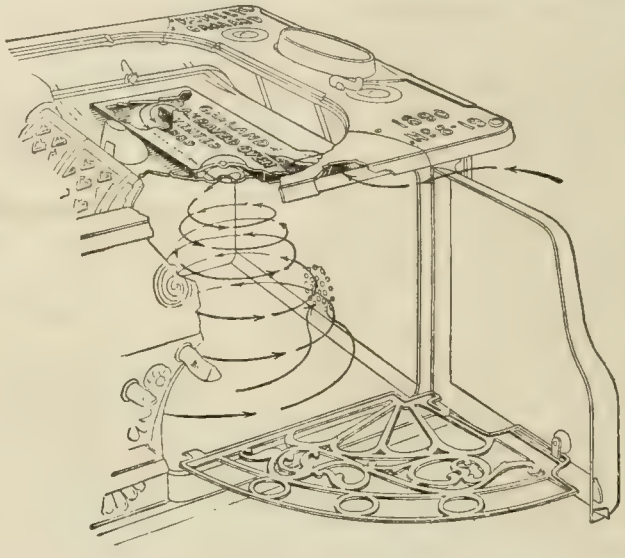

Fig. 1.—Aërated Oven and Automatic Shelf.

In Garland stoves and ranges the fresh air is taken in over the oven doors and passes through a circulating flue underneath a plate which is attached to the top oven plate, thus becoming heated, after which it is discharged into the oven. The heated fresh air then creates a literal whirlwind in rotating from the top to bottom of the oven, carrying all the impure air out of the oven, at the exit provided, and replacing it continually with heated fresh air. The air being heated before entering the oven, the temperature is not lowered. The vitiated air passes off into the flues, carrying with it all odors and gases given off by the cooking food. Some constructions admit cold air into oven, necessitating more fuel for the same amount of cooking. The same cut, it will be seen, shows the patent automatic

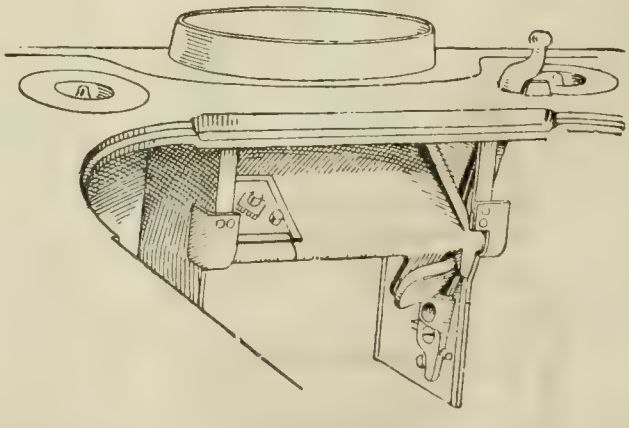

Fig. 2.—Direct Draft Damper.

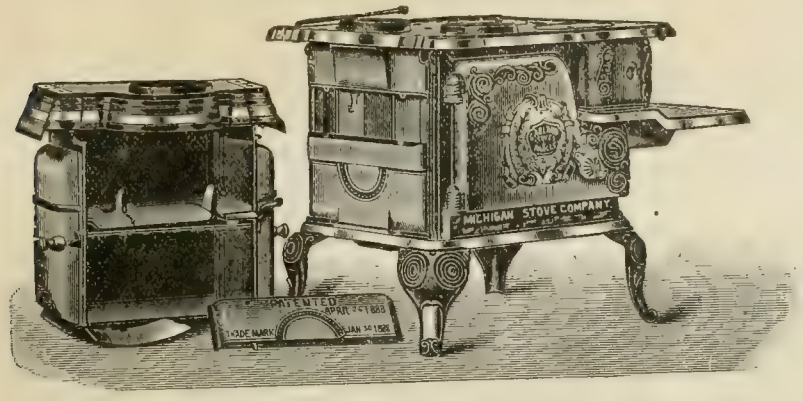

Fig. 3.—Interchangeable Reservoir and Closet System.

but does away with the rod running across the top oven plate, exposing it to the action of fire. This damper is practically indestructible, and can be removed and replaced in a few moments.

The interchangeable reservoir and closet system is illustrated in Fig. 3.

One of the greatest points of vexation and worry known to the retail stove merchant is overcome by constructing all the new line of ranges and cooking stoves so that a reservoir and closet can be instantly attached to a square stove, making it a complete reservoir stove; and, if a square stove is desired, the reservoir and closet can be easily taken off. This is a good point, as it enables merchants to order with less risk.

Sectional cuts are used freely to show peculiarities in interior construction.

shelf (which lies upon the oven bottom), upon which is placed any article which it is desired to roast or bake. By simply turning a knob on the outside of the oven door the shelf becomes attached to the door, and in opening the door the contents of the oven are brought out in full view, so that the convenience of examining or basting is greatly enhanced. The shelf is detachable, and can be used or not, at the option of the user.

Figure 2 illustrates the direct draft damper used in all Garland cooking stoves and ranges. The damper is operated by a handle placed on top of the stove. This arrangement is not only much handier than the old style of placing the damper handle at the side of the stove, where a person had to stoop to see which way it was turned,

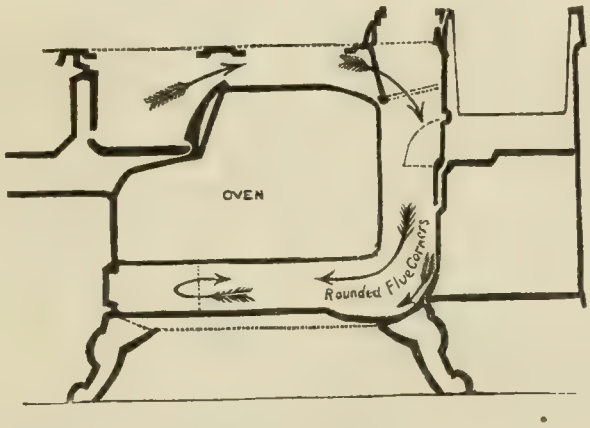

Fig. 4.—Goose-Necked Flue.

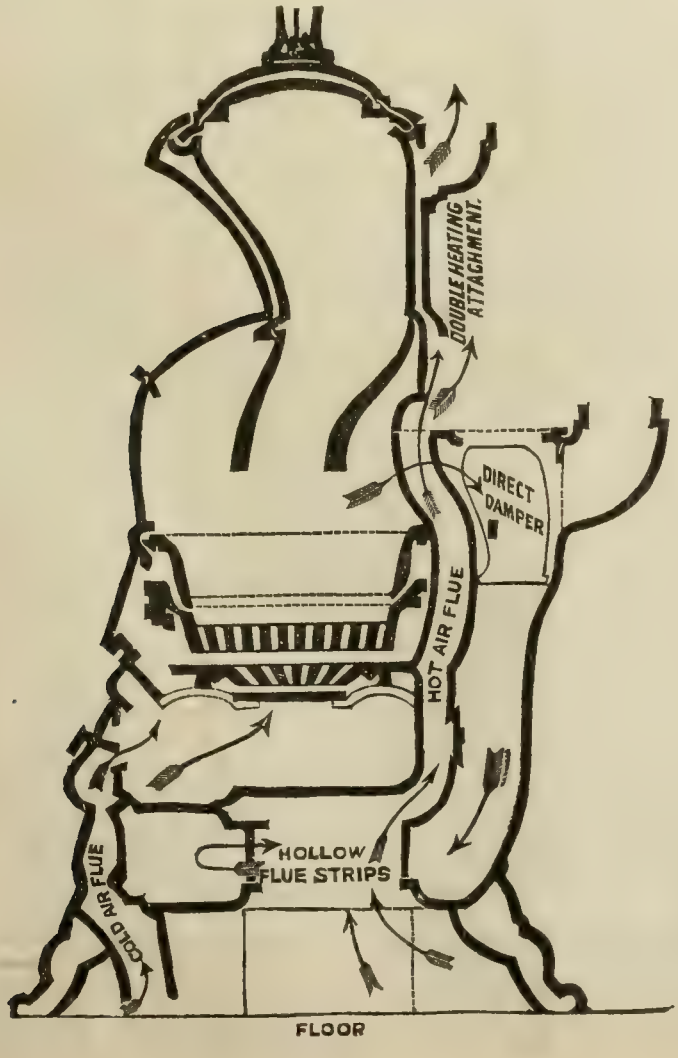

Fig. 5.—Sectional View of Art-Garland.

Fig. 4 is one of these, which shows what is called the "goose-necked flue." This method of flue construction is used in all Garland stoves and ranges. The rounded corners present no obstruction to draft, the principle being the same as in the construction of a round elbow, which is so superior to a square one.

Another sectional cut, Fig. 5, is here introduced to show the manner in which the draft and ventilating flues are illustrated which are used in the Art-Garland base burner for 1893.

The view here given is an excellent representation of the interior construction of this heater, the skeleton lines being ingeniously employed. The hot-air flues are very large and are located in the hottest part of the stove. The front of the flue gets its heat from the fire and the rear a strong heat from the back or down flues. This directly increases the heating qualities of the stove without in any way interfering with its outside or surface radiation. These facts apply to a great many of the Garland heaters, viz: Peerless, National, Acme (revertible flue), Ideal (base heater), Birch (revertible flue), Syphon Oak, Oak-Garland, Horizontal Oak (revertible flue), as well as Ivy-Pennant and Hickory-Pennant.

The catalogue by no means discloses the whole tale regarding the company's achievements, which have just culminated this year. They have accomplished a piece of unparalleled enterprise, putting out a full line of cooking goods all the way through. The work in preparation of this line covered four years and required an outlay greater than is employed by a large majority of stove foundries. Many foundries have less money in their whole business than is invested in this line of patterns. For instance, in wood goods there is a complete line of wood cooks, four-hole wood ranges and six-hole wood ranges;

in soft-coal goods there are four-hole cooks, four-hole ranges and six-hole ranges, while in hard-coal goods there are also four-hole cooks, four-hole ranges and six-hole ranges, in every style and every size. This is believed to be the very first time that any such radical change was ever executed by a stove house, or even dreamed of. Its magnitude can be understood better, perhaps, by the statement that not a single cast iron Garland cooking stove or range current with the company on May 1, 1893, is now shown in their July catalogue or in sample rooms in their various headquarters.

The Phillips & Clark Stove Company

of Geneva, N. Y., send us a copy of their illustrated catalogue and price-list for the present year. It is handsomely printed on a fine quality of calendered paper and substantially bound in board covers. The side title consists of the name and address of the company, a *fac-simile* of their trade-mark, an indication of the line of goods manufactured, and the date 1893, printed in silver upon a red background. The early pages of the volume are devoted to a bird's-eye view of the company's office and foundry at Geneva, a front elevation of their salesroom and warehouse at No. 185 River street, Troy, and to an announcement relative to terms and also concerning the goods which are shown in the catalogue. The leading place is given to the Grand Andes, a substantial six-hole range of good proportions, neat ornamentation, and embodying the modern improvements. It is intended for burning hard coal or soft coal, and is furnished with either the dockash, duplex, prismatic or vindex grate, as required. Following this construction is the Right-Grand Andes, which has been added to the company's assortment this season. It is the same as the stove just described, with the exception of the fire box, which is at the right hand as one stands facing the oven door. Under the name Andes the company offer a six hole range which has been before the trade for some time, and which has met with a very large demand. It is made in the usual modifications, several of which are presented in the volume before us. The Glen Andes is another member of this class and has proven very popular with dealers in all sections where it has been introduced. The same may also be said of the Home Andes, which has been on the market for the past five years. Among the other goods of attractive exterior and embodying the latest improvements we note the Lake Andes, made in three sizes ; the Right-Lake Andes, a four-hole construction, which has been introduced to the trade this season ; the Active Andes, a sheet flue four-hole range, made in three sizes, and the New Grand, a cheap six hole range. The cook stoves are next considered, and are represented by the Model Andes, for any kind of fuel ; the Anchor Andes ; the Star Andes, a four-hole wood cook ; the Bristol, Girard and and New Reliable. The Art Andes is the leading parlor stove, and is so well known to the trade that special reference to its features of construction is unnecessary at this time. The Crown Andes, a first-class parlor heater, has been improved this season and is offered in two sizes having fire pots measuring respectively 14 and 16 inches in diameter. The Pearl Andes, the Grove Andes, the Magic Andes, the Round Andes, the Iron Andes, Gem Andes, Oak Andes, Cottage Andes, Julian, Sharon, Putnam, Medallion and Salem are some of the other goods which are illustrated and described. An alphabetical index, a list of stoves for which repairs can be furnished, and a price-list of brick, are some of the other features of the volume.

Abram Cox Stove Company.

"Catalogue 1893–94 Abram Cox Stove Company, Philadelphia and Chicago; established 1847, incorporated 1892," is the inscription, in silver-bronze letters, on the front cover of a volume of 144 pages now being distributed to the trade. The back cover has a design in silver-bronze, with the Novelty trade-mark in the center, which enumerates the standard productions of the company. Folded over the cover, to be readily seen, is a loose sheet stating that the offices, showrooms and warehouses have been moved to the foundry, at American and Dauphin streets, where enlarged facilities are enjoyed. An announcement to the trade, terms, special notice, suggestions and some commendatory reference to their ranges occupy the first few pages, after which we find the Messenger Novelty, a handsome range, in the place of honor. This in turn is followed by other popular ranges, the Wayne Novelty, Valley Novelty, right and left oven, New Splendid and Lansdale. Five-hole ranges are next considered, with the Splendid occupying the first place, and then the Ruby, Ionic, Surf and Dot. The New Niagara and Quaker City are flat-top cooks of neat design. A display page heralds cooking and heating goods of interest to architects and builders, and a loose sheet states that the company are agents for the Novelty Circulator and issue a special catalogue of those goods. The Cuisine Novelty is a wrought-steel French range that can be furnished from 30 inches to any length required, and made in all the usual variations of style. The Model Novelty and Novelty Kitchener are cast iron ranges of fine appearance, adapted to the use of either upright or horizontal boilers, and with high and low hot closets. A cut shows the ease of renewing the grate in the Novelty Kitchener. The Novelty Furnace line is led by the original style, followed by the Ideal Novelty, which presents some entirely new features and is made as a combination heater, with steel radiator for soft coal, and with a cast-iron radiator, and for setting in a brick chamber. Some sectional views show the fire pot and grate and hot-water section and the radiating section in such a manner that the movement of the smoke is readily understood. These are followed by the Splendid Novelty, Success, and Success Novelty portable and the Grand Novelty brick-set furnace. The Fireside is an open grate fire-place heater, leading a line of portable grates and fire-place linings. The Radiant Novelty, Parlor Novelty, Palace Novelty and Starling square stoves make up what they claim to be an invincible line of parlor heaters. The Crown Novelty, Aldine Novelty, Marvel Novelty, Oxford, Polo, Magnet and Darby are a line of Russian iron direct draft and revertible flue single and double heaters that are made to meet all requirements. The Dew Drop, Alaska, Dandy, Arctic, Picket and Handy are a line of cast-iron heaters. Several pages are devoted to stove hollow ware, fittings and repairs.

Bussey & McLeod Stove Company

of Troy, N. Y., have issued, under date of July 1, a well-arranged catalogue of Gold Coin stoves, ranges and heaters. The 158 pages of which the volume is composed are bound in flexible covers carrying side titles, embossed in old gold and green bronze upon a groundwork of light maroon. The front cover is embellished with a *fac-simile* of the company's trade mark resting upon an oak branch, while interwoven with the design is their name and address and the date 1893. Across the top of the book is the inscription "Gold Coin stoves and ranges." The fourth page of the cover carries a panel with an old gold border, showing a bird's-eye view of the works on Oakwood avenue, Troy, while above this is a branch of oak leaves and the figures 1893. The printing of the catalogue is well done and the engravings clearly show the decorative features of the stoves illustrated. The goods of the company are well known to the trade under the name "Gold Coin," and are offered in sufficient variety to meet the requirements of dealers everywhere. The new patterns brought out this season and the special features incorporated were fully covered in the review of the Chicago Stove Works, who make the Gold Coin goods for the Western sections of the country.

Southern Stove Works.

We are indebted to Kiechle, Brentano & Oberdorfer, proprietors of the Southern Stove Works, Evansville, Ind., for a copy of their stove catalogue for 1893-4. The volume is made up of something over 100 pages, bound in colored paper covers, with side title in gilt letters. The frontispiece is a general view of the company's warerooms and offices on Seventh avenue, extending from Water to Ohio streets ; while the several pages which follow call attention to the new goods which have been brought out this season ; a telegraphic code, which may be used in ordering supplies by wire ; a statement of the company's guarantee ; terms ; directions for operating and putting up stoves, and to the announcement that the Southern Stove Works make and furnish all odd plates formerly produced by Browneller, Grayville & Co. and Kiechle & Harrison. The lines of specialties presented in the catalogue embrace a pleasing variety of cook stoves, ranges and heaters adapted for different fuels. Our Leader, a four-hole wood cook, is first considered, following which, under the same name, is presented a line of four and six hole ranges. This stove is made in the usual styles and sizes and is one of the latest additions to the company's assortment. The Royal Oak, a six hole range made in two sizes ; the Royal Leader, a four-hole coal cook made in seven sizes ; the Bazar, a four hole coal stove made in two sizes ; the Grand Future, made in two sizes, and the Irondale cook for coal only are also presented. The heaters occupy the latter portion of the volume, and are represented by the Royal Oak for 1893 in the leading position. Next in order is the Leader Oak for wood or coal, and made in four sizes; the Advance Franklin for coal, in two sizes; the Art Leader, a neat cottage parlor stove, just brought out, in three sizes for wood and the same number for coal; the Mikado, a first-class Todd, and a varied assortment

of box, cannon, globe, laundry and cottage parlor stoves. A long list of hollow ware, prices, &c., are features of the closing pages.

ODD PLATES.

THE MANY FRIENDS of Thomas J. Douglass, one of the heating engineers of the Richmond Stove Company, will be grieved to learn of his most serious illness, confining him to his home and withdrawing him temporarily from the field of his accustomed labors.

ONE OF THE GIANT HEATERS, made by D. H. Erdman, Camden, N. J., is being set to heat the primary school at Collingwood, N. J. Mr. Erdman is following his usual custom of spending the summer at his cottage at Island Heights, N. J.

"ANNOUNCEMENT SUGGESTIONS" is the title of a four-page circular from F. M. Borden & Bro., Philadelphia, who for years have made a specialty of stove repairs. The Novelty trade-mark is at the top of the page, and at the bottom is this explanation: "Sales Agency for Abram Cox Stove Company, Leaf Stove Company." The text impresses the necessity of a thorough explanation and description of the repair parts wanted, with the complete name, number and dates on the stoves. Then they give their understanding of the front and right and left sides of a stove. The other three pages show skeleton cuts of a flat-top cook, a high oven range, a five-hole range, a base burner and the Novelty furnace, all having the parts numbered and a list of the correct names with these numbers opposite. This effort should prevent many annoying mistakes and delays if heeded when the fall opens.

HENRY GLEASON, 108 Beekman street, New York, factory agent for three classes of stove trimmings, says that so far his orders are up to the average of last year. He looks for a fall trade of good proportions, for the reason that, according to his observations, based on personal visits to foundries, about the same amount of castings are being put in the sand as heretofore. He explains why, in these times, this is so, by saying that stove manufacturers have been through about five years of experimentation in styles, &c., and have about settled on staple lines that can be safely carried over if necessary.

J. B. BORDEN of F. M. Borden & Bro., Philadelphia, is visiting his brother in Chicago and doing the World's Fair. A pleasure is in store for some of the stove and gasoline goods manufacturers, where he will make some social and business calls.

SCHWAB & SERCOMB of Milwaukee, Wis., favor us with copies of two interesting publications which they have just issued relative to their Gilt Edge furnaces. One of these is entitled "Comfortable Homes." It consists of 64 pages, giving a large number of photo-lithographic views of dwelling houses and churches in various parts of the country which are heated by Gilt Edge furnaces. A treatise on warming and ventilation occupies several pages of the work, giving practical suggestions to those engaged in supplying heating apparatus, and covering such details as draft, instructions for making estimates, setting furnaces, furnace management and how to economically manage a furnace. The Schwab & Sercomb anti-clinker lever movement rocking grate is illustrated and described, and several pages are devoted to sectional views of the Gilt Edge furnace, showing the different styles of construction, as adapted to houses of different sizes, or for burning the various kinds of fuel. The illustrations are of a high order of merit, and the work is remarkably full of details desired by those who are in search of an efficient furnace as well as members of the trade who need data for comparing the Gilt Edge with other furnaces. This publication forms the sixth annual catalogue of Schwab & Sercomb. The second publication is entitled "Comfortable Homes and a List of People who Live in Them." It consists of 48 pages of testimonials of the Gilt Edge furnace, and a long list of names and addresses of the persons who are using it. Illustrations are also given of the furnace.

AN ADVERTISING sign measuring about 8 x 28 inches and made of heavy cardboard has just been distributed to their customers by the Peninsular Stove Company of Detroit, Mich. The sample before us carries in large white letters upon a blue ground the word "Peninsular," below which, upon a white ground, is the inscription, "Sold by J. S. Brubaker." At the left, occupying the full width of the card, is a *fac-simile* of the company's trade-mark printed in blue and white. The entire design is of such a character as to be readily seen at a distance, and the sign suspended in a dealer's store cannot fail to catch the eye of intending purchasers.

THE WROUGHT IRON RANGE COMPANY of St. Louis have just closed contracts for furnishing complete kitchen outfits for the Oriental Hotel at Dallas, Texas; also the Vicksburg Hotel Company at Vicksburg, Miss.

A LOCAL PAPER STATES that the Chattanooga Stove Company of Chattanooga, Tenn., are working a full force, and that the shipment of goods is fully equal to those of previous seasons.

ON THE AFTERNOON OF TUESDAY, August 1, F. & L. Kahn & Bro. of Hamilton, Ohio, shipped 23 carloads of stoves to different sections of the country. A second consignment was made, we understand, the latter part of the same week. This is certainly a gratifying condition of affairs, and indicates that the company's goods are meeting with an active demand.

AMONG the recent appointments by the Governor of Massachusetts was that of Richard E. Warner of Taunton as a member of the Board of Arbitration and Conciliation, in place of Ezra Davol, whose term has expired. Mr. Warner is a member of the well-known firm of White, Warner & Co., who give employment to a large force of hands, and are regarded as one of the most successful and enterprising firms in the country. We understand that Mr. Warner was indorsed for the position to which he has been appointed by leading manufacturing concerns, as well as by many business and professional men.

A CARD COMES to us from J. G. Sorgen, 266 First street, Portland, Ore., manager of the Pacific Coast branch of Hart & Crouse, this firm being successors to Portland Cornice & Roofing Company.

"MIDSUMMER SUPPLEMENT NO. 7" is the name of the neatly printed pamphlet of 44 pages just issued by the Fuller & Warren Company of Troy, N. Y. A good quality of paper is used, and the text is in two colors, making a pleasing contrast. The engravings are up to the high standard characteristic of publications issued by this concern, and clearly show the decorative features. The pamphlet before us describes the new ranges and heaters brought out by the company for this season's trade. The ranges "are in all the styles, sizes and grades known to the trade," and the six leaders are fitted with the maker's patent oval fire box, in which may be used the draw center, the Dockash or the triangular grate. The new ranges are known as the P. P. Stewart, for hard or soft coal or wood; the F. & W. Co., with single oven; the Eastern Stewart, with sheet flue and large, well-shaped oven; the Germania, fitted with the company's system of hot-air circulation and oven ventilation; the Diamond, a low-priced stove; and the Signal Diamond. There are also shown in the catalogue the F. & W. Co. wrought-steel oven range, the Advance and the Rescue, together with the Splendid base burner, the Art Splendid, improved for 1893, the Matchless Diamond and the P. P. Stewart round surface burner, made in a variety of sizes. It is stated that over 2,000,000 Stewart stoves have been made and sold.

THE NATIONAL VAPOR STOVE & MFG. COMPANY of Cleveland, Ohio, made an assignment on Monday, August 7. The names of R. J. Cummer, vice-president of the company, and Thomas Rath, secretary, were on the deed of assignment, making Charles Stone of Oberlin, Ohio, assignee. The assets are said to be estimated at $125,000, and the liabilities at $90,000.

CRIBBEN, SEXTON & CO. of Chicago, Ill., have issued to their friends an interesting World's Fair souvenir. Inclosed in heavy paper covers measuring 3¼ x 5¼ inches is a series of views covering the principal buildings at Jackson Park, Chicago. In connection with each picture is a statement of the ground area occupied and the cost of the building. Backing these views of the World's Fair structures is advertising matter, including illustrations and text. The goods to which attention is invited embrace the Universal line of heaters, prominent among which is the Radiant Universal hard coal base burner, made in three sizes, one of which is provided with oven. Upon the fourth page of the cover is a view of the exhibit of Cribben, Sexton & Co., in Section O of the Manufactures and Liberal Arts Building.

DEHAVEN & CO., LIMITED, Pittsburgh, Pa., are directing the attention of the trade to a parlor stove which they have christened Fairy Cinderella and a cook stove known as Magic Cinderella, both of which have recently been put on the market. The former is referred to as being provided with a new style of direct draft, is made in large sizes and is adapted to the use of either soft or hard coal. The ash pit is extra large and deep, there is a duplex grate with large feed door, deflecting smoke plate, nickel foot rails and name plate, illuminated clinker doors, extra large fire chamber lined high up with fire-flint brick and mounted perfectly air tight. The design of the stove is handsome throughout and it is made in four sizes, the inside diameter of the smallest size being 12 inches and of the largest size 15 inches. The Magic Cinderella is referred to as a handsome and an entirely new coal and wood cook stove. The oven is extra large and high, there are ample flues, draw hearth, large cut top, ash pan, and dump and

shaking (or basket) grate is furnished, as desired. It has heavy sectional linings, tin lined oven doors and extra large nickel and tile doors plates. It is furnished to the trade in three sizes, and inquiries and orders are being received rapidly.

The Rochester S., F. & S. M. W. Association.

We are indebted to secretary D. G. Robbins for the following entertaining account of the picnic of the Stove, Furnace and Sheet Metal Workers' Association of Rochester, N. Y. The picnic, which was the third annual one, was held July 26. With the report sent us we also received a group photograph of the good-looking picnicers. Mr. Robbins' account is as follows :

Resolved, That the secretary be instructed to write to *The Metal Worker* an account of our picnic. Carried.

This edict was issued at our last meeting of the Stove, Furnace and Sheet Metal Workers' Association of this city, which was organized several years ago for the general social welfare of its members. Much good is being done by getting acquainted with each other and finding that business men in the same kind of trade may meet not only in a body, but individually, and discuss matters of prices, stock, work, &c., without that feeling of jealousy which usually exists among business men of the same kind. While but a small percentage of our members attend the regular monthly meeting, a large number attend our annual outings.

Well, I started out to write about it and have been drifting, but here goes: Ticket $1.50, takes you by Bay Railroad to Sea Breeze, then by boat to Newport House dinner, and return same route. Our Executive Committee arranges everything for us, so all we have to do is to follow the leader and do not worry about how we shall have a good time. Our president, the genial, whole souled and lofty John O. Vogel, the president of the John Siddons Company, always goes with us, and every year cuts the watermelons—that is to say, he provides an abundance of the finest watermelons in the market to treat the boys. He calls us all "boys" when we are eating melons. To see the groups of melon eaters, each with his face behind a big slice of watermelon, would make a picture. After eating melons, first in order was base ball, and nines were chosen representing members from the east and west sides of the river, and with our jolly president as umpire the fun begins, and when dinner was called the game stood 30 to 12 in favor of the west siders. Short speeches by the members and for the good of the order followed dinner, and then base ball, boat racing, &c., helped to make the afternoon too short to get us discouraged with the fun, and you may be assured that old and young of our number take part, and never a word or look showing any jealousy or ill feeling between the members. At this, the third outing, the tie that binds seems to grow stronger, and in our every-day life, whenever we meet, the same friendly feeling exists and we look forward to the coming of another outing.

We do not wish to burden your space too much with an account of our association, but I send you names of most of those who attended our last outing, to whom any one may write regarding the association. Many such could be started all over the country and much good come from them.

OFFICERS.

President, John O. Vogel.
Secretary, D. G. Robbins.
Treasurer, F. H. Williams.

EXECUTIVE COMMITTEE.

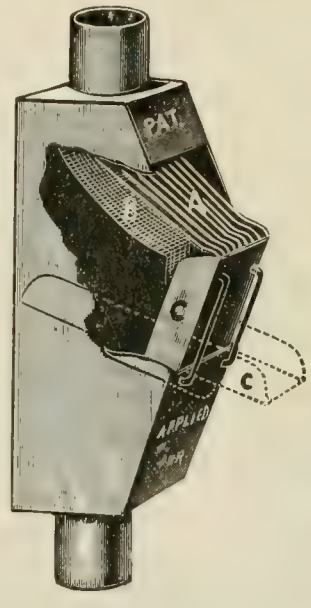
L. Pitchard, John Fricker, M. J Lennon, John Barnett, Rich. Kingston.

MEMBERS.

Albert Will, Frank Callister, John B. Snyder, L E Mason, Geo. Clarke, Henry Hauser, W. H. Harris, Robert Calder, W. B. Bruce, F. S. Slagel, J. H. McConnell, J. H. Myers, I. Kaiser, J. B. Baumer, C. D. Then, J. Flemming, J. Graham, John A. Walter.

Self Cleaning Strainer and Cut-Off.

The accompanying illustration presents a broken view of the self-cleaning strainer and cut-off manufactured by W. C. Hopson & Co., Grand Rapids, Mich. Referring to the illustration, the grating A is to allow sticks, leaves and other large articles to pass off as they are thrown down by the water. The finer sieve B, placed immediately under the grating, strains the water still further and washes into the cut-off C. By dropping this cut-off into the position shown by the dotted lines and sliding it back it forms a complete cut off, making it possible to rinse the roof before allowing the water to pass into the cistern. Both sieves are removable and can be easily replaced in case of accident. These strainers and cut-offs are made in four sizes, 2, 3, 4 and 5 inch.



Self-Cleaning Strainer and Cut-Off.

One of the most singular exceptions to the rule of unsatisfactory business conditions this summer, observes the Cleveland *Leader*, is the great increase in traffic on the Erie Canal and the corresponding improvement in the condition of the boatmen. Nearly twice as much grain has gone to the seaboard by the canal route as was shipped that way in the corresponding part of last year, and freights have been by no means remarkably low. This shows how valuable the canal still is as a safeguard against high rates on the railways between the lakes and the sea, for, if the water route had been closed this summer, grain freights from Buffalo to New York would surely have been a heavy burden to producers of very cheap cereals.

New Publications.

HENDRICKS' ARCHITECTS AND BUILDERS' GUIDE AND CONTRACTORS' DIRECTORY OF AMERICA. 1893-94. 648 pages 7 x 10 inches in size. Published annually by Samuel E. Hendricks Company. Price $5.

This work is specially adapted for the use of builders and contractors, and embraces something over 170,000 names, addresses and business classifications. Its usefulness, however, is not confined to the building trades proper, as the information furnished will prove extremely valuable to many manufacturers and dealers as well. It is in effect a directory so arranged and classified as to cover in a convenient and useful manner every branch of building construction and the industries connected therewith. Among the lists of names contained within its covers may be noted those of architects, carpenters, builders, brick makers, producers of cement, manufacturers of building iron of all kinds; dumb waiters, hot air furnaces, fire-proof building materials; iron and steel roofing, ceiling, siding, &c.; various kinds of lathing; mantels of all sorts; grates, fenders, tile, &c.; mason and builders' materials; painting material; plumbers', gas and steam fitters' supplies; roofers and roofers' materials; steam and hot-water heating apparatus; skylights, sash, doors and blinds, varnishes, ventilators, ornamental iron and wire work, and sidewalk lights; together with the names of car builders, engine and boiler dealers, electric lighting companies, engineers, granite dealers and workers; steam and hot-water heating contractors and stone dealers. A feature of the volume is a carefully arranged index by which any particular branch of industry may be easily and quickly found, while numerous sub-headings greatly facilitate reference. Scattered through the pages of the work are to be found the advertising cards of concerns engaged in lines of business connected with or allied to the building industry.

On Thursday, July 27, the up-river steamer "Columbia" celebrated the one hundred and third anniversary of the running of steamboats between Philadelphia and Burlington by a trial of speed. The trip was made, without the customary stops, in just one hour and seven minutes, the distance being 19 miles. This is in strong contrast to the first time the trip was made, on Tuesday, July 27, 1790, the vessel being the "John Fitch," built in 1788. She left Philadelphia at 10 a.m., with 30 passengers, and reached Burlington in three hours and ten minutes. Congress, then in session in Philadelphia, adjourned to witness the experiment, which was considered foolhardy in the extreme. The boat returned next day. The "Columbia" is a side-wheel steamer that has been doing regular service on the line between the points mentioned for a number of years.

A Fostoria, Ohio, dispatch says that a large number of farmers in that section are feeding their wheat to hogs rather than sell it at the low prices now ruling.

ROOFING AND CORNICE.

Patent Folded Lock-Seam Roofing.

In a recent issue of *The Metal Worker* we described and illustrated a new form of roof seams lately secured by letters patent to the Decatur Steel Roofing & Corrugating Company, Decatur, Ill., and known to the trade as Bonbrake's single-fold standing-seam roofing. The accompanying cuts show the construction of roof seams as used by the same firm in their patent folded lock-seam roofing, also their double-lock cross seam, used exclusively in connecting the steel sheets for this roof. This form of roofing, as illustrated, is said by the manufacturers to be a folded lock-seam roofing that is held secure to the sheeting or roof lath before seaming. It is claimed that the sheets or roof strips may be edged up and cleated, as shown by Fig. 4, stiffens the seam and holds it securely against the 1-inch flange, overcoming the objection of the raw edge at the bottom of the seam, and at the same time preventing buckling in the flange. When finished the seam is unbroken from comb to eave and it is stated has the appearance of a standing-seam tin roof, except that it is higher and stronger. The roofing is put up in rolls, containing material for two squares of laid roofing, unless otherwise ordered, and is made of Bessemer steel. Each sheet, we are informed, is inspected and guaranteed, and care is taken in painting.

Fig. 1.—General View of Cleat.

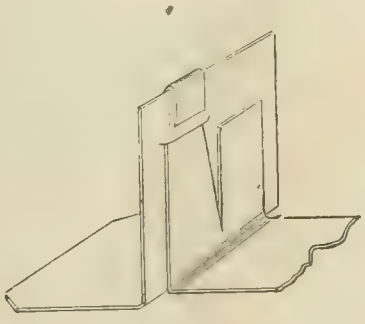


Fig. 2.—First Bend of Cleat.

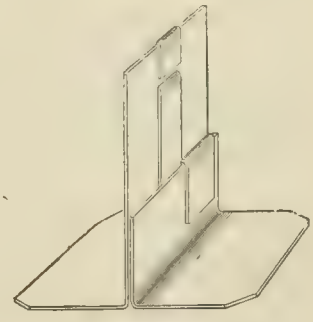

Fig. 3.—Cleat Between Flanges.

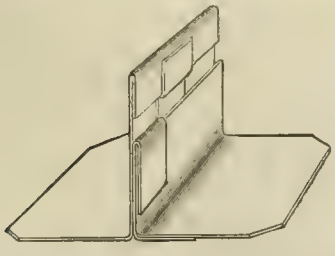

Fig. 4.—First Fold Formed.

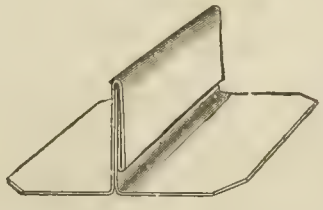

Fig. 5.—Completed Seam.

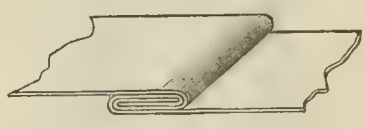

Fig. 6.—Double Lock Cross Seam.

PATENT FOLDED LOCK-SEAM ROOFING.

covering the entire surface to be covered, before seamers are used, and yet be secure and firmly held in position. This feature will be appreciated by roofers generally as an aduantage in case of rain and storm, or when it is necessary to get the building covered quickly. Referring to the accompanying illustrations, Fig. 1 is a separate view of a cleat. Fig. 2 shows the high prong of the cleat passed through the notch and over the edge of the 2¼-inch flange. In Fig. 3 the cleat is in position between the 2¼ and the 1 inch flanges, securing both to the sheeting or lathing. Fig. 4 is similar to Fig. 3 with the first fold formed. Fig. 5 shows the second fold seamed over the 1-inch flange, thus completing the seam. Fig. 6 is a double-lock cross seam. The hem, or first fold turned,

FLASHINGS.

J. Foerster & Son, 806 Fifth street, New York, have recently completed the hipped ventilating skylights, with glazed side sashes, operated with worm gearings from below, on the DeWitt Memorial Chapel, Cannon and Rivington streets, New York; also on the parochial school of St. Boniface's Church, Willoughby street, Brooklyn, N. Y. The firm are at present working on the tin roofing and galvanized-iron cornices and skylights for building corner of Tenth avenue and Twenth-seventh street, this city.

Work was made for the roofers in Camden, N. J., by a recent wind storm, which unroofed several buildings and damaged many others.

The Tin, Sheet Iron and Cornice Workers' Union recently held a meeting in Albany, N. Y., and elected the following officers: President, M. J. Quinn; vice-president, Daniel Powers; recording secretary, John J. Burns; financial secretary, H. H. De Rouville; treasurer, Thomas Gillen; conductor, John Roach; warden, J. Gilmour; trustee, Edward Keeler.

Says a Southern exchange: "The trade of the Chattanooga Steel Roofing Company, Chattanooga, Tenn., is growing, right through hard times and hot weather." The company manufacture a full line of steel and iron roofing and siding, and of roofing paints.

Reports from members of the Iron and Steel Roofers' Association confirm rumors of hard times in that industry. At Canton, Ohio, the principal seat of the industry, there is very little doing. In ordinary times fully 750 tons of black and galvanized sheets are consumed by roofing concerns during one month. It is now stated on good authority that 200 tons would probably exceed requirements. St. Louis manufacturers are in about the same shape. This is usually the busiest season of the year for the roofing trade. A revival is hoped for and confidently expected during the latter part of this month.

The pinch of hard times is being felt even by the leading railroads. President Roberts of the Pennsylvania issued last week an order for reducing the hours of labor in the mechanical department of the railroad from six days a week of 10 hours per day to five days of nine hours each. The order affects all the shops of the Pennsylvania Railroad system, including the leased and controlled lines. This action has been taken with a view to reducing expenses.

THE RETAIL STORE.

Fall Stove Trade.

It is not too early for the local dealer to be considering how he shall get his usual annual profit from this branch of business, particularly when there is a disposition against money outlay. If this revenue is cut off by the unnatural condition of affairs it will be severely felt by many dealers. It will not do, in the face of such a possibility, to depend on ordinary methods to make sales, or to wait to see if the condition will improve. Now is the time for the busy brain to plan a campaign that will be successful in securing what traffic there may be, or a generous share of it. Not the least important feature necessary will be a well-selected line of goods, which must be displayed with a constantly changing attractiveness and must be explained with an enthusiasm that is inspiring, for the old methods are sure to prove disappointing if relied upon this fall.

Mystic Water Filter.

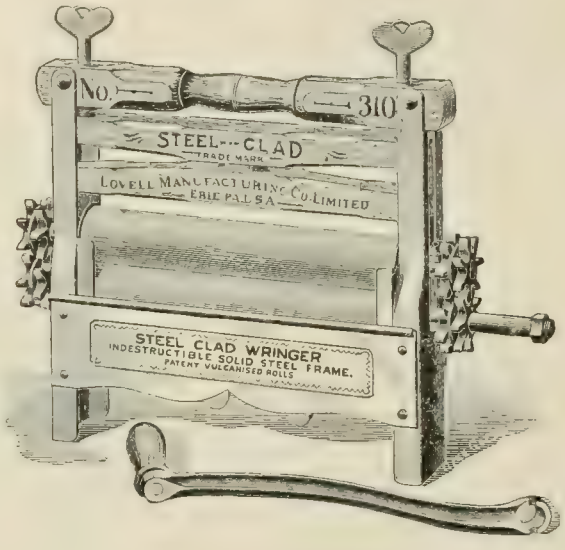
Jones Mfg. Company, Boston, Mass., for whom Edward G. Shepard, 142 Chambers street, New York, is sales

Improved Water Filter.—Full Size Cut.

agent, are offering the Mystic water filter as here shown. It is constructed of cast brass with removable caps and woven wire strainers at each end, all of which are nickel plated. The interior is filled with bone charcoal. It has a waterway as large as the threads will allow, delivering a full, round stream of water, without splattering. Both ends are alike, so that it may be cleansed as often as desired by reversing. When necessary, it may be quickly taken apart and refilled with charcoal and put together by any one. For use on plain bibbs the company furnish a thread attachment. This filter has been designed to meet a demand for an article of this kind at a low price.

Steel-Clad Wringer.

Lovell Mfg. Company, Erie, Pa., W. H. Quinn & Co., 103 Chambers street, New York, agents, are putting the Steel Clad Wringer on the market as shown herewith. The frame of the wringer is made of wrought steel, which, it is explained, is cut, punched and formed with dies, the parts then being riveted firmly together, and the entire frame thoroughly galvanized. To



Steel-Clad Wringer.

the opposite side of the wringer to that shown are attached regular-width swing clamps and clothes guide, all of galvanized metal. The manufacturers state that by this method of construction they are enabled to retain the general form and desirable features of the wood-frame wringers; to overcome their most serious defects, and to produce a wringer frame that is practically indestructible. The point is made that a stronger frame is thus produced without increased weight, one that will not rot or rust, and a wringer easily kept clean. These wringers are made in six sizes, from 10 x 1¾ inch rolls to 12 x 1⅞ inch rolls.

MEMORANDA.

An illustrated catalogue of electrical machinery and general electrical material, just issued by Taylor, Goodhue & Ames of 348 Dearborn street, Chicago, Ill., gives attention, among other things, to the Burton electric cooking devices. These include tea kettles, egg boilers, spiders, chafing-dishes, oatmeal boilers and water kettles. The volume is made up of over 200 pages and is profusely illustrated.

Charles A. Mutton has just established himself in business at 29 West Seventh street, Canton, Ohio, where he will carry in stock a line of stoves and ranges and give attention to repair work.

In "Uncle Sam's" collection from the dead-letter office in the Government Building at the World's Fair, of the things sent by mail the tinner's goods shine brilliantly forth, a battered coffee pot, a teapot and a flour sifter being shown amid jewelry, clothing and provender.

Commenting upon reports about unsuccessful canning enterprises, the *American Grocer* says: "Scores of farmers have become bankrupt and have been forced to sell their estates and personal property, owing to losses in small canning houses. In the Western States small factories and many large ones have sunk money from the start. In California the profitable canning factory is the exception, not the rule. And yet the industry is spreading all over the country, being stimulated by offers of a donation of land by small towns desirous of encouraging new industries. Inexperienced men enter the field and throw unknown brands of staple articles on the market to compete with well known and long established popular brands. Farmers become packers, and profess to be satisfied if the result of their work shows that they have obtained more per acre from raising vegetables for canning than if they had raised wheat or corn. Canning is a science, and so is the art of cooking. Factories require trained men and large capital, and unless these are available it is folly to start new packing enterprises."

Judge Lacombe of the United States Circuit Court of New York, in the case of an alleged contract laborer who was sent back to Bremen by the Commissioner of Immigration, but for whose detention a writ of *habeas corpus* had meanwhile been obtained, decided that immigrants sent back to Europe are within the jurisdiction of the commissioner until landed on the other side. The man will therefore be brought back at the expense of the Government in order that the case may be tried in the United States Courts.

TRADE REPORT.

The Iron Market.

The enormous restriction of business is well reflected in the returns of the blast-furnace capacity active on the first of this month, when the weekly production had fallen to 107,042 tons per week, or 67,000 tons below the record of June 1. Since the beginning of the month additional stoppages have taken place, and we are probably now not running much above 100,000 tons per week, against 180,000 to 185,000 tons, which is the record in active times.

In all lines ready money can command its own basis of settlement, but, unfortunately, cash customers are very scarce now.

While a larger volume of business is confidently looked forward to at an early date, the conviction is gaining ground that it will take a long time to get over the havoc created during the past three months, and that the profits of the balance of the current year will contribute very little toward repairing shattered fortunes. Far-sighted business men fear that before the industry has recovered from the effects of the financial cyclone it may suffer renewed blows through tariff agitation. A long period of low values is looked forward to, even if financial affairs improve steadily from now on, which is the best hoped for.

Transactions of magnitude are so rare nowadays that little opportunity is afforded to report concerning prices and sacrifice sales practically monopolize the markets. Under the circumstances, quotations are nominal, and are only the starting point for negotiations.

One point seems to be brought out very rarely, and that is that accounts are being steadily reduced, and that, therefore, the amounts due for merchandise must be liquidating quite rapidly, while no new engagements are being entered into.

Pig Iron.—The New York market is quiet and weak, there being urgent sellers and a very slack demand. We quote Northern brands $14 @ $15 for No. 1; $13.25 @ $14.50 for No. 2 at tidewater. Southern Iron, same delivery, $13.75 @ $14.50 for No. 1; $12.25 @ $13.25 for No. 2; $12 @ $12.25 for No. 3; $12 @ $12.25 for No. 2 Soft, and $12.50 @ $13 for No. 1 Soft.

Advices from Philadelphia report that there is no market of any account for Pig Iron at that center, transactions being confined to small lots to cover temporary requirements. In such cases prices are about in line with the figures named below, but in larger lots, or in forced sales, new elements have to be considered, which makes quotations an entirely different matter. The falling off in consumption has been heavy enough to more than offset the decrease in production, so that even if things get better it will take time to stiffen prices. But there is thought to be nothing seriously wrong in the Pig Iron situation. Anything like a fair demand would easily absorb the present supply, and there is no reason to suppose that it will be delayed very much longer. For the present, however, sales are made in small lots at about the following prices for Philadelphia delivery or its equivalent :

American Scotch, No. 1X...	$16.00	@	...
American Scotch, No. 2X...	15.00	@	....
Standard Penna. (Lake Ore), No. 1x.	14.75	@	$15.25
Standard Penna. (Lake Ore), No. 2x.....	14.00	@	14.50

The Pittsburgh market does not show any improvement either in demand or prices, any change in the latter respect being wholly in the direction of lower values. The furnace operators realize that restriction of output is the only safeguard just now, and following out this policy, production of Pig Iron in Allegheny County has been cut down over 10,000 tons per week within a short time. In the Mahoning and Shenango valleys production is being cut down, and will be further reduced before this month is out. Blast furnace labor in the valleys has been reduced from 15 to 20 %, taking effect on the 15th inst. In Foundry Irons there is nothing doing, and will not be until there is greater activity among the mills. Quotations are as follows :

No. 1 Foundry	13 00	@	13.25, cash.
No. 2 Foundry	12.00	@	12.25 "
Charcoal Foundry No. 1	15.00	@	16 00 "
Charcoal Foundry No. 2	14.00	@	15.00 "

A better inquiry is reported from Chicago as coming in from the country trade, and there is thought to be good ground for the belief that a great deal of Iron will be bought in the near future. Some considerable buying has been done, although the feature of it has been that sellers have been willing to contract for long delivery at prices now ruling, showing that they do not take a hopeful view of the future. Recent inquiries for Charcoal Iron have awakened consumers to the fact that but a limited quantity is available for future delivery during the latter half of the year. Should trade in this direction receive any stimulus it would seem that a sharp advance in Charcoal Iron is in order. The following quotations are subject to concessions for prompt cash and immediate shipment :

Lake Superior Charcoal.....	$16.00	@	$16.25
Local Coke Foundry, No. 1...	13.50	@	14.00
Local Coke Foundry, No. 2...	12.75	@	13.00
Local Coke Foundry, No. 3...	12.50	@	12.75
Local Scotch.....	14.00	@	15.00
Ohio Strong Softeners.....	15.75	@	16.25
Southern Silvery, No. 1.		@	14.50
Southern Silvery, No. 2		@	14.00
Southern Coke, No. 2.....	12.60	@	12.85
Southern Coke, No. 3	12 10	@	12.35
Southern, No. 1, Soft.....	12.60	@	12.85
Southern, No. 2, Soft.....	12.00	@	12.25
Tennessee Charcoal, No. 1...	16.00	@	16.50
Alabama Car Wheel.....		@	18.85
Hocking Valley, No. 1 ...:	15 25	@	15.50
Jackson County Silvery.....	16.50	@	17.00

The Southern Pig Iron market shows no improvement, the depressed financial situation dominating the trade, which in some respects is worse than ever. Cash buyers can obtain Iron almost at their own prices, but there is little more than a single car lot demand, and while the offerings are not large, they are abundant for the wants of the trade. The sales of Iron to be consumed locally have been the smallest of any week this season, and they have been only moderately supplemented by some sales for the North and East. Quotations are given as follows :

Foundry.

Southern Coke, No. 1.	$12.75	@	$13.00
Southern Coke, No. 2.....	11.25	@	11.50
Southern Coke No. 3.....	10.75	@	11.00
Ohio Soft Stone Coal, No. 1....	15.50	@	16.00
Ohio Soft Stone Coal, No. 2....	14.50	@	14.75
Lake Superior Coke No. 1.....	15.00	@	15.25
Lake Superior Coke No. 2.	14.00	@	14.25
Hanging Rock Charcoal, No. 1..	18.50	@	19.00
Hanging Rock Charcoal, No. 2..	17.50	@	18.00

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75	@	18.00
Lake Superior Car Wheel and Malleable.....	17.25	@	17.50

Metal Market.

Pig Tin.—Sales to interior dealers and consumers have been rather below the average for the season. The straitened financial condition of many buyers and heavy carrying charges have, it is said, offset the improved change in the statistical position of the metal. The possibility of removal of the duty on Pig Tin at a not very distant date induces caution in buying on the part of consumers, unless for absolute needs, and these are smaller than is usual at this season. The price for spot Tin has fallen about ¼¢ during the week. The following interesting remarks appeared in the Metal Exchange circular of August 8: The official returns of the United States Bureau of Statistics

give the following figures for the fiscal year ending June 30, 1893:

Total importation of Tin into the United States....	61,076,464 lb.
Of which were re-exported.	231,204 lb.
	60,845,260 lb.
Of which were imported into Pacific ports.....	2,680,777 lb.
Leaving a net importation of.....	58,164,483 lb.
Equal to.....	25,960 tons

of 2240 lb. for the United States, excluding the Pacific ports.

According to these figures the consumption of the United States for the year ending June 30, 1893, has been as follows:

Stock, June 30, 1892.....	3,800 tons.
Import for year ending June 30, 1893, excluding Pacific ports.	25,966 tons.
	29,766 tons.
Stock in United States, excluding Pacific ports, June 30, 1893	9,910 tons.
Consumption for year ending June 30, 1893, excluding Pacific ports.....	19,856 tons.
Imports into Pacific ports during the year, taken as consumed there, 2,680,777 pounds, equal to.....	1,197 tons.
Total.....	21,053 tons

foreign Tin consumed in the United States during the year, as stated above.

These figures are a further proof of the correctness of the monthly statistics compiled by this exchange. The latter with the beginning of this year took the consumption of the United States:

Excluding the Pacific ports, at an average of.....	1,600	tons per month;
the actual consumption 19,856 tons per year gives an average of...	1,655	tons per month.

Copper.—Lake Superior Ingot has been offered at as low as 9¾¢ ℔ lb for large lots on the Metal Exchange for August and September delivery. The terms were net cash. A few small parcels have been sold at very near to that price from second hands. As a rule, producers' agents claim that anything below 10¢ is the exception, but there is enough outside selling and offering to make it very difficult to maintain prices on the basis of 10¢ for this month delivery. Hardly as formidable competition has, however, developed in the cheaper varieties of the metal. Business on the whole continues light and slow, and such demand as there is consists in small spot lots. Prices show some sign of weakening. Small lots of Lake Ingot Copper are quoted at 11¢; Ansonia grade Arizona at 10⅛¢, and Ansonia grade casting at 10¢, while for spot cash even these figures might be shaded.

Sheet Copper.—The demand remains unchanged in its dullness. Small orders only are received by jobbers. The comparative stagnation in the building trade which exists just now has been acutely felt in the market for Sheet Copper, which shows far less movement than should be the case at this time of the year.

Pig Lead—Slow business and the same weak and unsettled conditions as prevailed last week continue. Under the financial pressure some holders have parted with stock at 3.25¢ @ 3 30¢. As far as could be learned, about 500 tons went at those figures, nearly if not all of which was taken by consumers for prompt delivery or immediate shipment. That the purchases could be duplicated is not clear, but the indications at this writing are that 3.30¢ stands as selling price for ordinary Western in round lots, or, at least, the best at which round lots can be placed for prompt or current-month delivery. For small lots 4¢ for American Pig represents the ordinary selling price. Jobbers report that business in Pig Lead and Lead products has, on the whole, been surprisingly good all this year and has shown slight sympathy with the general business depression. Prices have remained firm and a constant current demand, mainly for small lots, has kept the trade moving. A falling off during the latter part of this month will not, however, be entirely unlooked for. Stocks are, nevertheless, very low throughout the country, and the indications are for a fair to moderate business until the fall.

Sheet Lead and Lead Pipe.—Business is reported as good. Plumbers' requirements appear to be as large as at any time previous. Prices remain unchanged at former quotations.

Spelter.—Consumers who purchase in this market have been extremely indifferent buyers the past week. Lower prices named by sellers have failed to arouse interest in the slightest degree, and, to all accounts, immediate wants have necessitated none but very commonplace purchases.

Sheet Zinc.—Business flat in this material. Except for small and fitful orders, of a hand-to-mouth nature, there would be practically nothing doing. Prices are unchanged at 6¼¢ for 600 lb casks, and 7¢ ℔ lb for small lots.

Tin Plates.—There is no improvement in the demand for any class of Plates. The market is principally a retail one, and shows a soft tone all along the line. Ordinary Coke Plates have been so'd at 2½¢ @ 5¢ below the popular quotations. Bright Charcoals and Ternes have passed out at similar concessions. Ordinary requirements are exceptionally small, especially those of can makers, who have in many instances canceled contracts for Plates in consequence of their orders being cut down. Packers and canners, although having good crops to handle, are unable to utilize them in most cases, through inability to procure the necessary funds to pay for materials and labor. Roofing Plates are in moderate demand, but even these fall far below expectations. Those which are taken are mostly of domestic make, imported Ternes being stagnant. The shipments of Tin Plates from Wales are very light, and few orders are being placed on the other side. As an instance of the depression it may be mentioned that one prominent firm of Tin Plate brokers, who normally handle some 3000 boxes of Tin Plates daily, recently stated that there were days when they did no business at all to speak of. A London cable of August 9 reports on the English market as follows:

In the market for Tin Plate there has been very little change. Some sellers note rather better inquiry, but bids are invariably very low and operators inclined to postpone business as much as possible, pending better reports from America. The mills are indifferently employed and makers are not forcing sales, owing to lowness of prices. Exports last month were 33,000 tons, against 31,000 tons in July, 1892. Shipments to the United States, 22,000 tons and 24,000 tons respectively. Liverpool prices are as follows:

IC Charcoal, Alloway grade.....	13/0 @ 13/6
IC Bessemer Steel, Coke finish. ...	12/0 @ .. .
IC Siemens " " "	12/3 @ ....
IC Coke, B V. grade, 14 x 20.....	11/9 @ 12/
Charcoal Terne, Dean grade.....	11/9 @ 12/

Sheet Iron.—The market for Black Iron is practically at a standstill, except for such business as is done directly with the mills by large consumers. Prices are quoted at ¼¢ to ⅛¢ a lb lower all along the line, and spot cash would secure considerable concessions. There are, moreover, no signs of any improvement while general business remains in its present unsatisfactory condition; or at any rate before October. Galvanized Iron shows some improvement. A fair general demand for this material is reported; but mainly in smallish lots for prompt shipment. Little forward business is done. Russia Iron is quiet at unchanged prices. Jobbers are trying to place orders for arrivals this month or next. Contracts for arrivals can be made at much less than spot prices for approved assortments.

In order to keep in line with the policy of their competitors for retrenchment of expenses under present condition of business, the Ætna-Standard Iron & Steel Company, large manufacturers of Iron and Steel Sheets and Bars at Bridgeport, Ohio, have been compelled to make a general reduction in wages, which affects officials of the concern as well as employees. Owing to a very large shrinkage in values of manufactured products, particularly iron, manufacturers throughout the West have been compelled to pursue this course in order to more nearly equalize costs with present selling prices. For the purpose of meeting any urgent demands on the part of their customers, and also to assort up their stocks, the Ætna-Standard Iron & Steel Company have started up three of their light Sheet mills and will, therefore, through their period of idleness be able to meet any ordinary call for supply of stock material. The firm have not fixed any date for general resumption of work.

The Palace Regal Ventilator is the name of a stove to which particular prominence is given in the announcement elsewhere of E. Bement & Sons, Lansing, Mich. The special features of this Stove are alluded to, and its efficiency is commented upon.

Chicago Report.

Scrap.—Buying prices have been again marked down by the dealers, and are now as follows :

	Per net ton.	Per lb
No. 1 Wrought Scrap	$8.00	....
Machinery Cast	6.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	4.00	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	6.00	....
No. 2, such as Shovels, Hoes, &c	4.50	....
Old Boilers—whole (Iron)	6.00	....
" (Iron)—cut in single Sheets and Rings	9.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.50	....
Turnings	5.00	....
Horseshoes	9.00	....
Copper Bottoms	....	5½¢
Copper Clips and Heavy	....	6½¢
Heavy Brass	....	6 ¢
Light Brass	....	4 ¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2¼¢
Rubber	....	2 ¢

Anthracite.—Dealers report no life to trade. They continue to quote carload lots of 12 net tons as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

A DECISION was recently filed in the United States Circuit Court by Judge Coxe, in the suit of the Steam Gauge & Lantern Company of Syracuse, and the R. E. Dietz Company of New York City, against the C. T. Ham Mfg. Company of Rochester, in which the court orders a decree against the defendants for an injunction and accounting. The court decides that the "feature which distinguishes the Higgins lantern from all preceding tubular lanterns is that the glass globe is mounted in a separate frame and tipped over from the burner laterally without disintegrating the tubular frame or the globe holding the frame of the lantern. No one had done this before. The advantages of the tilting globe over many, if not all, of the previous structures, are obvious; a number of inventors were seeking to secure these advantages, but Higgins was the first to do so by introducing this feature successfully into a tubular lantern. He is, therefore, entitled to protection."

THE NATIONAL HANDY ARTICLE CO. have begun the manufacture of specialties at Grand Rapids, Mich. Among other articles, they are turning out the Security Dust Pan and the Duplex Mop Wringer. They use special machinery, and have equipped a factory at the corner of Louis and Campon streets. John L. Smith, formerly of the firm of Smith & Sanford, is secretary of the company.

CONDITION OF THE

Hardware Trade.

THERE is very little change to note in the condition of the Hardware trade during the week. Buyers, large and small, are confining their purchases strictly to their immediate requirements, and manufacturers are everywhere reducing their production to as low a point as they can. Those who have many goods on hand are generally shut down. Manufacturers and jobbers are making very little effort to force goods on the market, there are few travelers on the road, and the business which is being done is confined to orders to complete assortments. While collections are still slow, we hear many reports of improvement in this respect.

Advices from Chicago.—The Hardware trade generally shows no signs of improvement, but on the other hand it does not continue to fall off. A very steady movement has been in progress for the last two or three weeks. The merchants appear not to be worrying over lack of trade, however, as they state that they would not care to put out large lines of credit under existing financial conditions. They are now patiently waiting for the tide to turn, which they think will probably occur after the crops of this season are safely housed. Collections are fairly good, as debtors are liquidating as rapidly as possible.

Parkhurst & Wilkinson have opened their Heavy Hardware jobbing establishment under the assignee. They hope soon to take the business out of the hands of the assignee by making an arrangement with their creditors for time payments. The firm are confident that they will be able to pay their creditors in full and express their intention not to ask for a compromise.

Notes on Prices.

Cut Nails.—During the past week inquiries from all sections have been extremely light. Most of the mills are closed, and production continues very small. Quotations still rule at $1.05 for carload lots at mill, but Nails have been offered at lower prices, and concessions can be obtained without difficulty on desirable orders. Small lots from store in New York are held at $1.30.

Advices from Chicago.—This branch of trade is in the same condition as reported during the last few weeks, only small quantities being called for from the factories, and the old prices prevailing of $1.20 to $1.25, according to quantity. Assortments in factory warehouses are being broken, however, and some of the manufacturers will have to start operations soon to keep up stocks. Jobbers report a light trade, with prices unchanged at $1.25 to $1.30, according to quantity.

Wire Nails.—Negotiations for an agreement among the makers for the regulation of this business are still progressing. Mills are generally closed, although stocks in their hands are small. The regular quotation for carload lots at mill remains unchanged at $1.35, but, as we noted last week, this price is shaded.

Advices from Chicago.—Arrangements were practically consummated at the meeting of the Wire-Nail manufacturers last week for the formation of a pool to control the output of Wire Nails, and in this way limit the production to the actual requirements of consumers. The manufacturers hope to thus regulate prices, and avoid the ruinous rates which prevailed throughout the country this spring. A meeting is to be held this week to complete the arrangement and perfect some details for carrying it out. In the meantime prices are maintained at $1.45, Chicago, for factory lots, and the makers are restricting their terms to 2 per cent. off for cash, or 10 days' time instead of the usual 60 days. The factories are expected to continue shut down during the whole of August, so as to clean up stocks in the different warehouses. Jobbers report their prices unchanged at $1.55 to $1.60 from stock, according to quantity.

Barb Wire.—Trade is extremely light in Barb Wire, and quotations remain nominally at $2.45 to $2.50 for carload lots of Four-Point Galvanized at mill, small lots from store being held at the usual advance. The Continental Wire Company, St. Louis, under date of August 1, send out quotations shading these prices 15 cents "to close out stock on hand."

Advices from Chicago.—There is a great deal of competition for the small business now in sight and prices have receded considerably. The manufacturers are selling for shipment from factory at $2 for Painted and $2.40 for Galvanized, while even this is not a fair price when sales are made in competition with St. Louis manufacturers. Jobbers report a better demand from the farmers with sales of small lots from stock at $2.20 to $2.60 respectively.

Metal Mat.—Joshua Horrocks, 45 Cliff street, New York, is offering his Metal Mat from the following list, subject to a discount to the trade of 50 per cent.:

No.	Each.
1, 16 x 24	$2.00
2, 18 x 30	2.50
3, 22 x 36	3.50
4, 24 x 48	5.00
5, 30 x 48	6.00
6, 36 x 48	7.00
7, 36 x 60	9.00
8, 36 x 72	11.00

Extra sizes, 90 cents per square foot.

Steel-Clad Wringer.—This wringer is put on the market by the Lovell Mfg. Company, Erie, Pa., for whom W. H. Quinn & Co. are agents, 103 Chambers street, New York. The Wringer is sold from the following list, which is sub-

ject to a discount of 12½ per cent. to the trade:

Size numbers.	Size of Rolls.	Per dozen.
310	10 x 1 3/4	$32.00
312	11 x 1 3/4	38.00
314	12 x 1 3/4	44.00
316	10 x 1 7/8	38.00
318	11 x 1 7/8	44.00
320	12 x 1 7/8	52.00

Rope.—Although at this season of the year transactions in Rope are light, and this year more so than usual, prices have been reduced about ¼ cent per pound. We quote for Rope of 7/16 inch diameter and larger as follows:

	Cents.
Manila	8
Sisal	6½
New Zealand	6¼

Double-Pointed Tacks.— Manufacturers of this line are now offering them at lower prices. Quotations run from discount 90 and 10 per cent. to 90 and 10 and 10 per cent.

Glass. — Representative New York wholesale dealers in both domestic and imported Glass state that their sales for the month of July ran ahead of those for the corresponding month last year. Conservative customers of these concerns are reported as ordering only what they need, and what they are able to pay for; and probably would not buy for speculative purposes if Glass was offered at half the present price. This course of action is looked upon as an encouraging feature in the present financial situation. There is a continual consumption of Glass in a limited way throughout the country for repairs and small improvements, the outlay for which is small in individual cases, yet in the ag gregate amounts to a large sum. Prices on American and imported Window Glass remain unchanged. We quote prices unchanged, as follows; American Window Glass, less quantities than carloads, 80 and 10 per cent. discount, f.o.b. at shipping point. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 5 per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Old Rubber.—The following represents the prices paid for Old Rubber delivered in New York, except as otherwise stated, prices being fairly steady, with a dull market:

Car Springs, ton lots, ℔ lb.	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@	.03⅜
Rubber shoes, less than carloads	@	.03
Large Hose, ℔ ton	@	9.00
White Wringer Rolls, ℔ lb.	@	.04¼
White Wringer Rolls, good grade	@	.05
White Syringes, ℔ lb.	@	.05

Old Rags, Paper, &c.—The demand has been limited, but prices remain steady at about the following quotations, delivered in New York:

No. 1 White Rags	3⅝	@ 3⅞¢
No. 2 White Rags		@ 1¾¢
Mixed Rags		1¼¢
Blues and 3ds		1¾¢
Hard Sized White Shavings		2¾¢
No. 1 White Book Shavings		@ 2½¢
No. 2 White Book Shavings	1½	@ 1¾¢
Light Book Shavings	⅞	@ 1¢
No. 1 Mixed Shavings		1¢
No. 2 Mixed Shavings		½¢
No. 1 Printed Books	1	@ 1½¢
Ordinary Mixed Books	½	@ ¾¢
Newspapers		½¢
No. 1 Manila Paper	1¼	@ 1½¢
No. 2 Manila Paper	⅞	@ 1 ¢
Bogus Paper	¾	@ ⅞¢
Common Paper	⅝	@ ¾¢
Straw Chips	½	@ ⅝¢
Binders' Clippings	½	@ ⅝¢
Jute Butts		1½¢
No. 1 Jute Bagging		@ 1½¢
Mixed Bagging		1¢
No. 2 Bagging		¾¢
Hemp Twine		2½¢
Manila Rope		2½¢
Jute Rope	1½	@ 1¾¢
Mixed Rope	¾	@ ⅞¢

Old Metals.—There is little movement in Old Metals, prices depending largely upon special conditions of purchase or sale. The following show fairly the current quotations in New York:

Heavy Copper		9½¢
Light and Tinned Copper		8½¢
Heavy Brass		7¢
Light Brass		6¢
Lead		3½¢
Tea Lead		3¼¢
Zinc		2¾¢
No. 1 Pewter		14¢
No. 2 Pewter		7¢
Wrought Scrap Iron	gross ton,	$13.00
Heavy Cast Scrap	gross ton,	9.00
Stove Plate Scrap	gross ton,	6.00
Burnt Iron	gross ton,	4.00
Mixed Bagging		1 ¢
No. 2 Bagging		¾¢
Hemp Twine		2½¢
Manila Rope		2¾¢
Jute Rope	1⅞	@ 2 ¢
Mixed Rope	¾	@ ⅞¢

Trade Notes.

The Western Electric Heating Company were recently incorporated at St Paul, Minn., with a capital of 1,000,000.

In our last issue reference was made in these notes to a new advertisement of the Illinois Roofing & Supply Company of Chicago. The presumption at that time was that the advertisement had been inserted. Owing, however, to the non-arrival of an electrotype it was thrown over to this week. This explanation is due to those who may have observed the lack of correspondence between the item and advertising pages.

John S. Brooks of 235 Fifth avenue, Brooklyn, has opened a Patent Department in his stove store, and states that his 30 years of practice at the Patent Office enables him to prosecute applications with success, especially in the line of stoves and sheet-metal work, in which he has taken out 20 patents for himself and made out the papers for them and many other applications for other parties, losing but a single case so far.

W. H. Stewart, 182 Front street, New York, makes Liquid Asbestine Fire-Proof Composition which is largely used by furnacemen for pasting asbestos paper on furnace pipes.

The foundry of Barlow, Condit & Morris, Newark, N. J., is located in exactly the same place where Seth Boyden commenced to experiment in the production of Malleable Iron Castings in 1826. Daniel Condit, of the present firm, became associated with Mr. Boyden in 1836, and the business has been in the families of the present owners ever since. In addition to turning out Malleable Castings that are ordered from all sections of the United States, they turn out soft, smooth Gray Iron Castings. As is natural with a plant that is frequently called the home of the Malleable Iron Casting, many interesting reminiscences have accumulated there bearing on the attempts to produce Castings by various novel processes.

Macknet & Kenely, managers of the United States Rocking Grate Bar Co., Newark, N. J., send in a neat pamphlet bearing the inscription: "A clean fire is the base of all fuel economy." It describes the grate and contains cuts showing its construction, adaptability and operation, from which a clear idea of its merit can be gained. Claims are made as to its efficiency and a number of references given. In construction it consists of a number of "saddles" or coal-bearing pieces that rest on a series of bars so connected that a lever readily moves every part of the grate.

W. G. Morris of Barlow, Condit & Morris, Newark, N. J., is enjoying a vacation at the Delaware Water Gap, being the first time he has left the malleable and gray iron foundry business for a genuine recreation for 25 years.

The Britton Rolling Mill Company, Cleveland, Ohio, are operating their plate mill and turning out 50 to 60 tons per day. Their sheet mills are not running at present. Engines and other machinery for two black plate mills for tinning are on the ground, but will not be erected until the present unsettled condition of national affairs is changed.

The works of the American Sheet Iron Company, at Phillipsburg, N. J., have started up after an idleness of nearly two months.

Sidney Shepard & Co., extensive manufacturers of stamped ware at Buffalo, N. Y., have reduced their working force one-half. When running full 400 men are employed.

The Vienna Enamel & Stamping Works, at Chesterton, Ind., have shut down indefinitely, throwing 150 men out of employment.

In an announcement elsewhere in this issue E. E. Dempsey, 109 Lafayette avenue, Syracuse, N. Y., directs attention to the Giant Safety Combination Furnace, which burns kerosene as well as gasoline on a new principle. The weight of the furnace is 7½ pounds, and it is made of copper and sheet steel. It is said to run six hours without pumping, and with a pint of oil can be run for ten hours.

Stransky & Co., 27 Murray street, New York, are manufacturing a Stove Mat for use on kitchen ranges, cook stoves, &c. It consists of a sheet of asbestos, circular in form, with a rim of tin, the whole article being 9 inches in diameter. The rim is kept in place by means of holes pricked in with a center punch. Instead of a wire ring riveted on with which to hang it up when not in use, an eyelet sufficiently large is passed through the asbestos, thus enabling it to be packed closely for shipment. These Mats are placed on the top of cook stoves to keep milk, chocolate, cereals, &c., from boiling over or scorching, and can also be used for making toast.

Samson Cordage Works, Boston, have engaged as their direct representative C. M. Avery, who is well and favorably known to the jobbing trade. The company report their works in full operation, with a fair demand for goods for early shipment.

CORDLEY & HAYES, 172 Duane street, New York, sole agents for United Indurated Fiber Company of New Jersey, in announcing the total destruction by fire of the Lockport, N. Y., factory on July 29, say, under date of August 4, that they have already a force of men at work clearing the ground on a new location adjoining their old plant. This tract of 9 to 10 acres, recently purchased, they say will be partially covered by six new buildings, each averaging 50 x 200 feet in size, and their contracts call for the completion of them in 60 days. They assure the trade they are confident of being in a position not only to turn out goods within three months, but in rebuilding have provided for a 50 per cent. added production, which will enable them in the future to be more prompt in the execution of orders.

SOME OF THE WORKMEN of the Lalance & Grosjean Mfg. Company's rolling mill, at Harrisburg, Pa., proposed last week forming a branch of the Amalgamated Association. On hearing of their intention, the manager informed them that the mill would be shut down pending their decision. The men then held a meeting, with the result of relinquishing their project.

E. BISSELL, SON & CO., 12 Murray street and 15 Park Place, New York, will, on Thursday, August 17, conduct an important sale of Gray Enameled Opal Ware, Granite Iron Ware and Blue and White Ware, by order of the Lalance & Grosjean Mfg. Company and the St. Louis Stamping Company. As will be noted by referring to their Special Notice on another page, the goods will be sold in case lots, packed ready for shipment, and will consist of a complete line of Tea and Coffee Pots, Wash Basins, Tea Kettles, Convex, Berlin, Lipped and Climax Saucepans and Pots, Preserving Kettles, Dish, Milk, Pudding and Fry Pans, &c. A large line of Shoe and Cloth Brushes, first quality, will also be disposed of.

AN ILLUSTRATED AND DESCRIPTIVE CATALOGUE of the Richmond steam and hot water heaters is issued by Isaac Coffin & Co., 52 Sudbury street, Boston, Mass. The publication is a neat volume of 40 pages, and describes the Richmond heaters with the aid of both sectional and general illustrations. No attempt is made to explain in detail the different systems employed in the construction of the Richmond apparatus, but only an outline sketch of the heater is given. In addition to the catalogue portion, which also comprises lists of sizes and prices, a number of different patterns of radiators are illustrated and a list of testimonial letters and references is presented.

THE FACTORY of the Lalance & Grosjean Mfg. Company, at Woodhaven, L. I., and their rolling mills at Harrisburg, Pa., will be closed down indefinitely after to-day, throwing 1700 persons out of employment. Vice-President A. J. Cordier stated to a representative of *The Metal Worker* that the firm had been unwillingly constrained to take this course on account of the dullness of trade and diminution of the volume of orders, which did not justify them in piling up a greater amount of stock than is already held, especially in view of the possibility of tariff changes affecting their special productions.

A new instrument has been constructed under the auspices of the German Government Telephone Department, by which it is intended to control the duration of telephonic conversations and to measure the time occupied. It is called a telephonometer, and registers automatically the time of each conversation from the time of ringing up of the exchange to the ringing off signal. By this means it will be possible to reduce the rentals of telephones to a scale according to the service, instead of a fixed charge to a constant or desultory user alike.

Electric Cementation of Steel.—The influence of electricity on the cementation of steel seems likely to throw light on the physics of the process. M. Jules Garnier has recently published the results of his first experiments in this direction, in which a current of electricity was made to form a circuit with the carbon packing as anode and the iron to be hardened the cathode. Both the metal bar and the carbon were inclosed in a tube, which was placed horizontally in a small reverberatory furnace and heated during the experiment, his idea being that the heat would determine the mobility of the carbon, while the electric current would determine the direction of motion of the carbon atoms. The minimum voltage to overcome the resistance was employed, and in one experiment the conditions were 7 volts 35 ampères and 3 hours at a temperature from 900° C. to 1000° C. After the experiment the bar was examined and the cementation was found to have penetrated to a depth of 10 mm. In a second experiment two bars of metal formed the two electrodes, and were separated by a carbon packing of about 10 mm. In this case, with a current of 55 ampères, at a pressure of 2.5 volts, after three hours' heating, the anode bar remained unchanged, while the cathode was hardened to a considerable extent on the side opposed to the anode. It suggested that the cathode should be rotated during the process, and thus secure a uniform action. The rapidity of the process should more than compensate for the cost of the electrical plant, if future experiments confirm these results.

The *Financial Record* gives the following comparison of the approximate amount of gold and silver used annually in the industrial arts in the principal countries of the world:

Country.	Gold.	Silver.
Austria-Hungary	$1,960,428	$1,843,586
Belgium	684,970	396,822
France	7,872,620	4,260,540
Germany	11,969,280	5,872,600
Great Britain	6,280,150	3,564,916
Italy	1,186,270	425,640
Netherlands	296,842	628,280
Russia	5,670,000	3,875,890
Sweden	370,979	111,280
Switzerland	8,796,284	1,422,789
United States	16,784,196	7,398,984
	$63,472,019	$30,842,327

The civil service examinations which were held last week in Philadelphia to ascertain the fitness of applicants for positions under the National Government had the largest attendance ever held there, the candidates numbering over 1,200, or more than double the number that presented themselves four years ago. Of these, 1,019 were applicants for positions in the Post Office department.

One of the largest contracts ever given out by the Post Office was awarded to a Vermont paper mill last week. It calls for 11,000 tons of postal cards, or 600,000,000 in number, to be manufactured during the next four years.

News and Notes.

In the United States Circuit Court a Pittsburgh last week a bill was filed by P. H. and F. M. Roots of Connersville, Ind., against the Pennsylvania Coal Company and Dunmore Iron & Steel Company of Lackawanna County, Pa. The bill asks for an injunction restraining the defendants from making, using or selling an apparatus for removing slack coal upon which the plaintiffs claim a patent.

The American Wire Glass Mfg. Company, Tacony, Philadelphia, have had their large new factory run ning for nearly a month, and are now putting out some 3000 square feet of wire glass a day. The full capacity of the works will be 5000 square feet a day, which output will shortly be reached. Orders and inquiries for this new material are said to have reached the company from all parts of the world and they have received numerous expressions of approval from customers to whom they have already delivered consignments of wire glass.

One of the biggest street railway negotiations ever made was consummated in New Jersey a few days ago. The New Jersey Traction Company have absorbed or leased the traction lines in almost all the cities of the State, so that the syndicate now enjoys a practical monopoly of the street railway interests throughout New Jersey.

Heavy rains in the British Isles have somewhat relieved the gloom which has enveloped the agricultural industries, and better prospects for the wheat crop are reported, although the harvest will be a bad one in most parts of England. The *Times* says, however, that the condition of agriculture in Great Britain is about as bad as it can be, and prices for cereals, sheep and cattle are lower than they have been for years.

The "Black Country" in England bids fair to make its popular name inapt within a short time. A London journal noted lately the great change which is coming over that district in the growing use of gas and oil engines for motive power in place of the coal-fed furnaces and steam engines which have hitherto contributed to maintain a heavy pall of smoke over the country. This is now in a fair way to be obviated, and a complete transformation of the face of the landscape will in time be presented to travelers, who have always dreaded the railway journey through the "Black Country."

A new feature developed by the present money stringency is the collection by New York banks of drafts on banks in other cities and towns through the medium of the express companies. The cost of this transaction is materially below the rate charged for interior exchange.

On August 1 the new cruiser "New York" went into commission at Cramp's shipyard, and the 8-inch guns were hoisted on board. The barbettes and turrets will require another month to complete.

The New York *World*, in what it claims to be an authentic list compiled from official sources, places the present number of trades-union men now unemployed in this city at 36,177, or 27.6 of the whole.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

A reliable, temperate TINSMITH who understands general jobbing, roofing, assortment work, and has some knowledge of plumbing and iron-pipe work; married man preferred; experience and reference must be given; steady work if competent. A. T. Skillman, Hightstown, N. J. Aug. 12

Results of the Fair.

The manufacturer, reading about the increase in artistic taste which will follow the Columbian Fair, and the artistic results which will be obtained, is very likely to ask, What good will this be to me? Very much everywhere. It will mean a refurnishing and furbishing all over the country. It will mean that people everywhere will be dissatisfied with their old works and will wish for new. It will mean that things that have passed muster as handsome enough and good enough will be quietly handed over to the junkman and will be replaced by new at the first opportunity. It means the creation of a wide demand among people in comfortable circumstances in life. It will do more for the West than Philadelphia did for the East, and there will not be an architect, a hardwareman or a stove dealer who will not feel advantageous effects from the artistic side of the fair.

Electrical Plumbing.

Some time ago we called the attention of plumbers to the fact that their trade might be augmented and a very profitable line of work engaged in by the introduction of the electrical wiring of houses into their business. While this is not now a novelty in the plumbing trade, it is, notwithstanding, somewhat unusual to find plumbers in this country who have studied up the matter of electricity and its practical application sufficiently to enter into the work of wiring houses for annunciators and electric bells, &c. We believe that those enterprising master plumbers who have taken up this branch have been more than repaid for the trouble and work it has cost them, and we know that the practice is becoming more general, particularly among the younger members of the craft, who are ambitious and who are not afraid of hard labor. It will be an incentive to those progressive members of the craft to learn that some of their brethren abroad have gone ahead in this matter. It is natural that in the larger European cities where there is much electrical work done that there should be craftsmen equipped for this business, but it is somewhat of a surprise to learn from a recent issue of a local paper published in the island of Malta that the combination calling of electrician and plumber is there practiced by J. T. Paterson. In his announcement Mr. Paterson says that he has just received an extensive assortment of electrical goods and is prepared to fit up electrical appliances and keep them in order by contract for the year.

Keeping Things Square.

The shop or store with things askew bespeaks the character of the one in charge. It seems as though some men were born and bred with order in every act, while with others it is a faculty seemingly never to be acquired. In point of fact, it certainly is just as easy to place a thing squarely with relation to surrounding objects as it is to give it the appearance of having been simply dropped regardless of appearances. Nowhere does the effect of symmetrical arrangement show to better advantage than in the store. A single article misplaced or askew may have but little effect upon the general appearance, but the habit that allows an object to be thus placed will allow a hundred to offend the eye. The impression upon the customer may not be realized either by himself or the storekeeper, but nevertheless if he is a man of any orderly sensibilities he cannot help comparing store and keeper with others, and inevitably inclining toward the orderly arrangement and the man who can maintain it. It is sometimes surprising to see the effect of a few moments devoted to simply setting square a helter-skelter assortment of articles. In the shop, particularly where similar pieces are made in quantity, they can as well be laid in order as they are operated upon as thrown into an eye-offending pile upon the floor. The manager of such a shop may do much toward the education of his men in orderliness by simply compelling them to keep their work symmetrically arranged. It will not be long before general cleanliness and order will follow as a mere matter of habit.

Electricity and Drought.

The connection between telegraph wires and the recent drought in Europe and portions of the United States is not at first apparent. A correspondent of a Belgian paper, however, offers an ingenious theory by which he seeks to prove that the network of telegraph, telephone and street railway wires which now covers the two continents may have caused such a weakening and diversion of the terrestrial magnetism necessary for the due absorption of moisture by the atmosphere as to entail such a drought. He recalls the fact that as the earth is charged with positive and the atmosphere with negative electricity, we live, as Prof. Oliver Lodge has observed, between the armatures of an immense Leyden condenser. Each portion of the upper armature, which, descending in the form of a cloud, diminishes the thickness of the interposed air stratum, induces the danger of a disruptive discharge, which would be very formidable if the earth and clouds were perfect conductors. The Belgian writer accordingly advances a novel rain-making proposal, which has at least some plausible features of recommendation.

To Make Rain.

As the influence of electricity in provoking atmospheric disturbances is acknowledged, he proposes to charge the clouds by means of balloons with a sufficient quantity of high-tension electricity to "tap" their contents. He observes that 1093 yards of iron wire 0.04 inch in diameter weighs over 13 pounds and has a resistance to tensile strain of 10¾ tons per square inch, which is less for copper wire and equal to that of phosphor bronze of the same diameter, the weight of which is also nearly the same. A balloon of slight ascensional power may take up into the air one or more such wires several thousand yards long, which, connected with the earth, would constitute an immense lightning conductor, and draw electricity from the upper regions of the air. The balloon need have no occupants, the increased strain due to paying out the wire being compensated for by the automatic discharge of liquid or powdered ballast. This, the inventor believes, would be a powerful means of provoking a change of weather, and probably bringing about an abundant downpour of rain when desired. The amount of moisture in the air, strange to say, does not appear to enter into the calculations of those who would regulate the celestial watering pot.

Contracts and New Work.

We begin this week publishing items respecting contracts awarded and work under way and proposed, in a separate column, for the benefit of the heating and plumbing trades. For some time we have made a point of furnishing items of this sort, but we believe that compiling them and bringing them together in a single department of the paper will render them of not a little interest and value to many of our

readers who do work of this character. When the contract has been awarded it is a matter of only general interest as telling what firms have entered into competition and who was the successful bidder. The feature of especial value, however, that these items cover is the gossip about new work that is to be undertaken. Sometimes this information relates to alterations or new apparatus and fixtures that may not be installed for many months to come, but it gives the contractor a chance to look over the ground and familiarize himself with it before the bids are actually let. We shall be glad to receive information concerning new work of this sort, so that we may make this column of notes as full and valuable as possible.

Same as Last.

The necessity of explicit directions accompanying orders for goods, to which we referred in our issue of July 15, 1893, both as to the kind and quantity wanted, also as to how they are to be shipped, has called out a communication relating to this subject from a representative Philadelphia wholesale house. They advise us that a great many orders are received reading, so many boxes or so many pounds of material "same as last." This, they explain, involves the waste of a great amount of routine work and time, especially when many orders are received by the same mail, and there is always the possibility of an error should the house fail to unearth the very last order. It is believed customers get into the habit of writing orders in this way because they have the prior invoice before them at the time of making out the order, and do not realize the inconvenience it entails upon the house, nor the possibility of their not receiving the goods and quantities desired. With the rush of business any uncertainty as to just what is wanted adds largely to the liability of errors.

QUICK TRANSPORTATION.

The Philadelphia concern before referred to advise us that the Trades League of Philadelphia are taking up the matter of time made on shipments of goods, the form given herewith being printed on postal cards and used for this purpose :

1. Shipper's Name.....
2. Date of Shipment.....
3. Destination.....
4. Name of Railroad or Freight Line Used.
.....
5. Date of Arrival at Destination.....
6. Signature.....Consignee.

On the reverse side of the cards is the printed address of the general transportation agent of the Trades League. The first four items of these cards are filled out by the house shipping the goods, and the cards are sent by them to the consignee. The date of arrival of the goods and the signature of the firm receiving the goods are filled in by the consignee, and the cards mailed by him to the transportation agent. When the cards are received by him, his name and the date of receipt are stamped upon them, and they are returned to the house which shipped the goods. Using this system is considered a very important step, as the experience of shippers has heretofore been that when they inclosed their own postal cards to customers asking for information the retailers do not seem inclined to furnish it, probably through thoughtlessness on their part, and because they do not realize the necessity of giving the shippers all the information possible to aid in securing good railroad service. It is a common occurrence for shippers to receive requests to trace certain shipments, whereas consignees do not seem inclined to render the proper assistance in this direction when called upon to do so.

A Loud Telephone.

Many attempts have been made for some time past to construct a telephone which will really talk loud enough for a person in any part of a large room to hear and understand, but hitherto they have all failed with the exception of the "talking apparatus" recently devised by Mr. Graham of the Electric Wiring & Fittings Company, 2 Princes street, Westminster, London, and described in the London *Times*. He has succeeded not so much by an improvement on the existing telephones, although some modification of the apparatus has been effected, as by his method of arranging the circuit and bringing its resistance as low as possible. To this end the usual induction coil is discarded, and the two instruments, transmitter and receiver, are directly connected in circuit with the line and the battery. The transmitter of A at one end of the line is connected to the receiver of B at the other end. As this arrangement only permits of A speaking to B, and not of B replying to A without a change of the connection and a substitution of apparatus, two separate lines are employed having a common return wire. On the second line the transmitter of B is directly connected to the receiver of A. The two correspondents can thus talk quite freely with each other, and as the receivers speak out so as to be heard in any part of a room conversation can be carried on by each person simply speaking to his transmitter. This apparatus is attached to flexible conductors and is held in the hand. To open a conversation it is sufficient to pick up the portable transmitter and press a button in its casing so as to establish the circuit, then speak into it. The receiver at the other end acts as its own call-bell by the loudness of its voice, and the response comes equally prompt and loud. The user has, therefore, no need to listen carefully with one or two receivers held up to his head. All he has to do is speak into his transmitter and keep his ears open. The apparatus is therefore highly convenient, and allows the user freedom of action. It is chiefly intended for domestic service from one part to another of a house, office or workshop, and it will be especially useful on board ship, particularly in men-of-war, or in building yards, farms, newspaper offices and other large establishments.

This year's British wheat crop is estimated at 7,000,000 quarters, which leaves about 21,000,000 quarters to be imported. Reducing the stock left over from 1892, there will be needed 19,000,000 quarters. The *Mark Lane Express* of London, in its weekly review of the British grain trade, said a few days ago in respect of this circumstance: "It is not easy to see where this supply is to come from. It will absorb all the good crops of Russia, India and Southeastern Europe to fill the British requirements." Where do the United States and Canada come in? Wheat is said to be grown in both countries.

A New Chicago Cable Line.

The cable was started recently on Blue Island avenue, Chicago. The arrangement of the new Blue Island line is as follows: One cable rope runs from the power house at Twelfth street and Blue Island avenue out Blue Island to Western avenue; another runs from this power house up Blue Island avenue to Halsted and Van Buren streets and thence to the power house at Van Buren and Jefferson streets. There is also what is called a dead cable that runs in conduit or tunnel from the power house at Blue Island avenue and Twelfth street on Twelfth street east to Halsted, south on Halsted to O'Neil, back north on Halsted to Blue Island avenue, back on Halsted to Twelfth street and to the power house through the conduit. All these cables will be run from the power house at Blue Island avenue and Twelfth street. The down-town loop through the Van Buren street tunnel will be run from the power house at Van Buren and Jefferson streets.

The power house at Blue Island avenue and Twelfth street, which will furnish such an enormous power, is equipped with two 1000 horse-power Allis Corliss engines, two batteries of boilers, four in each, in which oil is used for steaming. Walker differential drums are installed, togeter with Walker friction clutches, which will allow any one of the cables to be stopped without interfering with the speed of the engines. There is a spare set of drums, so that in case of accident to any of the three cables the extra one may replace it. The plant is provided with two 25 ton cranes with travelers, so that in case of accident or for repair purposes any piece of the ponderous machinery may be readily lifted out of place.

The South Blue Island avenue cable, which runs from this power house to Western avenue, is 27,000 feet in length; that north on Blue Island avenue 12,000 feet. The basement of the power house, which contains the tension drums for stretching the cables, has also a complete electric light plant, by which the building is lighted. Both power houses were built by the Pennsylvania Iron Works of Philadelphia. The Halsted street lines will soon be in use. For the present, and until the down-town loop is put in, trailers will be detached from the grips at Van Buren and Jefferson streets and will make the down-town trip by horse-power by way of Van Buren, Dearborn, Adams, Franklin and Van Buren streets, back to connect with the cable at Van Buren and Jefferson streets.

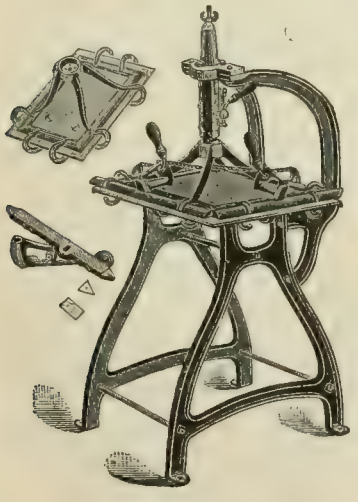
The *Daily Telegraph* of Sheffield, England, reports that during a heavy storm which visited Yorkshire recently large hailstones fell, some of which were weighed and turned the scale at 2½ ounces. The stones perforated the zinc roofing at Sir John Lawson's mansion, Brough Hall, Richmond, "riddling it as if with rifle bullets."

It is proposed that an exposition by the prize winners at the World's Fair be held in the Grand Central Palace, New York, in February and March next. An opportunity will also be given to local merchants who are not represented at the World's Fair to make exhibits of their wares at this exposition. Information can be obtained from the Manhattan Industrial Exposition Company, 122 West Twenty-third Street.

ROOFING AND CORNICE.

Quadruple Roofing Folder.

The illustration shows a machine recently patented by M. E. Hastings, New York Mills, Oneida County, N. Y. It is for edging sheets of tin plate for roofing, whether it is to be put together in rolls or to be used one sheet at a time, as in flat-seam roofing. In either case all of the edges are turned at one time, and as quickly as one edge could be turned in a folder. The action of the machine, it is pointed out, is so simple that a boy or common laborer can edge the sheets accurately and with great speed, 40 boxes being designated as an easy day's work. The machine consists of two side frames, supporting a bed, and an overhanging arm, to which is attached the sheet clamp. On two sides of the bed is a thin steel plate, over which the edges of the sheet are turned down. On the other two sides are adjustable guides



Quadruple Roofing Folder.

to hold the sheet in proper position and regulate the width of the edge. On the sheet clamp is another steel plate, over which the edges of the sheet are turned up when all four edges are required, as for single-sheet flat roofing. The clamp works vertically and perfectly true through the arm, subject to a spring to raise it, and holds the sheet down by means of a compound eccentric. It is operated with ease by a short lever. On each of the four sides of the bed and clamp are two half-circle bearings, making a complete circle when the clamp is down. In these bearings are four brakes, shown in the cut, two of which are connected by a strong chain with the other two, which have handles. To edge a sheet, the machine being open, put a sheet in against the guides, push down on the clamp lever which secures the sheet, then take hold of both brake levers and push them down and all of the edges are folded. A ball weight being a part of the brakes, they drop back out of the way as soon as released, and one hand releases the clamp, when the spring lifts it out of the way, while the other hand withdraws the sheet, with all four of the edges turned. If the sheets are to be edged for making into a roll the two brakes are unnecessary, and can be simply lifted out and the small square plates shown in the cut screwed fast to the ends of the brakes in use, instead of the triangular plates. The cut shows the machine with a bed and clamp for 20 x 28 sheets, and above it the same parts for 14 x 20 sheets, which are interchangeable. A claim made for the folder is that it overcomes the necessity of squaring the sheets before edging. The clamp and the bed plate make a perfectly square sheet after the edges are turned, as they take up any inequality. The quadruple folder, though now just being offered on the market, has been under test for several months by some large roofing firms, who give their testimony of its practical excellence. The saving of time and accuracy of results are specially noted.

The Sykes Steel Roofing Company.

The World's Fair exhibit of the Sykes Steel Roofing Company of Chicago, Ill., and Niles, Ohio, is located in section E on gallery floor in the north end of the Manufactures Building. The exhibit is thus isolated from the exhibits made by other roofing establishments, but it is found in company with quite a number of makers of building specialties. The company have erected an attractive pagoda, which forms a very neat office and headquarters, while at the same time it furnishes a practical illustration of the use of their products. Their patent improved standing-seam roofing, corrugated-edge roofing, V crimped roofing, corrugated roofing, sheet-steel brick, corrugated and beaded ceilings, sheet-metal siding and clapboarding are all shown, either as parts of the building or by samples attractively arranged. The walls are covered with Bostwick steel lath, left unplastered in some places to show how it is applied to partitions. The company have issued a fine Columbian souvenir catalogue, which is a really valuable publication, containing practical information appreciated by sheet-metal workers. It gives an illustrated description of the manufacture of iron and steel, taking the raw material at the blast furnace and following it through its different processes in the rolling mill as it is converted into sheets, then into the roofing works, and finally on the roof. The illustrations are very fine and worthy of the subject. It is an admirable book for a sheet-metal worker who has not been in the rolling mill and does not know how sheets are made. The company have two plants, one at Niles, Ohio, and the other at 611 South Morgan street, Chicago, both well equipped with the most modern machinery for the manufacture of roofing.

FLASHINGS.

SOME HANDSOME THINGS in sheet metal are the ornamental panels for a bank at New Rochelle, being made by Lyles & Mills at 231 William street, New York.

A GOOD AMOUNT of trade is being done in sheet iron in Minneapolis and St. Paul, according to local reports. Building operations are on a fairly large scale and have become so far advanced that a considerable amount of roofing is being done, calling for large quantities of this material.

ENGLISH trade journals speak of a growing demand for galvanized iron sheets in South America and South Africa.

A WRITER in the *Country Gentleman*, taking for his text an advertisement of some cheap roof protector, strongly recommends the use of pure linseed oil for this purpose. He says: "We have about 2580 square feet of iron roof. Once a year I send a lad up with a gallon of oil, which he spreads over it. This seems better than paint, as it will not crack or blister off and allow rust to go on below. It also takes much less to cover. The iron had a coat of red paint when first put on. By this simple and easy treatment I expect to see the iron roof last 50 years."

REARDON & ENNIS, 311 River street, Troy, N. Y., recently placed seven of their 36-inch Electric ventilators with connecting pipes on the Clinton State Prison at Dannemora, N. Y. The contract made with the State provided that the ventilation of the prison must be satisfactory to the authorities before payment should be made. That they have proven entirely satisfactory is shown by an excellent testimonial recently given to the firm by the doctor of the prison. These ventilators are also being used largely by paper mills and dye houses, the claim being made that they carry off all condensed steam and heated air that otherwise accumulates in the skylights and ceilings.

BY A DECISION of the Vermont slate trust the quarries of that section will be worked only four days in the week, beginning from last Monday, and on September 1 a 10 per cent. reduction in wages will be made.

THE CAMBRIDGE CORRUGATING COMPANY, Cambridge, Ohio, after being in business a little over one year, have vacated their leased building and moved into their own new factory, built especially for manufacturing a complete line of corrugated roofing and siding, and a variety of iron and steel products for building purposes. The new building is adjacent to railroad tracks and has excellant shipping facilities. New machinery and modern conveniences are employed. The officers of the company are T. E. Amos, president; C. S. McMahon, secretary; P. C. Patterson, general manager; W. L. Stanley, superintendent.

A patent has been granted to George L. Shorey, Lynn, Mass., for an improvement in heating apparatus, one object being to provide the mechanism that will operate, under thermostatic influences, a damper which requires considerable power to actuate it. In the patent specification a water motor is described for operating the thermostat, the regulation depending upon the supply of water to the motor.

PLUMBING and GAS FITTING.

A Review of Recent Plumbing Practice.*

BY GLENN BROWN, F.A.I.A.

The methods of planning and jointing pipe and setting fixtures in plumbing a house 15 years ago are interesting as a contrast showing the lack of intelligence, both of the designer and the workman, at that period.

Terra cotta pipes were used under buildings. The joints for branches were usually made by pecking a hole into the larger pipe and inserting the small one. No care was taken as to alignment of the whole. The spigot ends of the pipe were inserted into the hubs, carelessly as to contact, level or grade, often without cement. Old house sewers of this date when taken up have been found invariably acting as conduits for and distributing filth through the joints into and contaminating the soil beneath the house. Cast-iron pipe when used was then uncoated. For bends and branches there were few fittings, the ordinary method of branching being similar to that adopted with the terra cotta, pecking a hole and sticking in the end of the small pipe, this forming a projection on which foul matter could collect. The joint was covered with putty. Piping systems were never tested. The only tight joints made during this period were where lead soil pipes were used with wiped joints, the work being done by some old English or Scotch plumber. No system of pipe trap or local ventilation was in use.

The pan closet, with its large concealed receptacle for filth, was used everywhere. All plumbing fixtures were concealed by wood work, with numerous dark and inaccessible places in which the germs for filth diseases had a quiet and uninterrupted opportunity to breed. Fifteen years ago there was no literature on the subject, except a little in books on engineering or water supply, and the only way in which an architect could inform himself was to get instruction from the most intelligent plumber of his acquaintance, or begin the study of the appliances and practice as he found them, and improve on such methods according to his common sense, his mechanical, or scientific ability.

PLUMBING LITERATURE.

One of the first articles to call attention to this lack of knowledge was a series in the *Atlantic Monthly* by George E. Waring. The first article, published in 1875, and continued in 1878, advised reform and advocated an open soil pipe. Following this, in 1878, T. M. Clark wrote quite a practical series for the *American Architect* on "Modern Plumbing." By this it can be seen that the civil engineer and the architect instigated the reform. These articles and articles in the *Sanitary Engineer*, about the same date, were the first to advocate trap ventilation, the *Sanitary Engineer* giving a section of a house with all traps vented. The literature on the subject since that time has increased, but there is still a decided need for a thorough work on this topic.

S. S. Hellyer, prominent dealer in plumbers' supplies, a manufacturer and plumber in London, has written two practical books from the English standpoint, one in 1880, another in 1882, in which the methods and advice given are good, but it is simply an exposition of the English way of doing the thing.

P. J. Davies (1887), who is another English manufacturer and plumber, has put upon the market an elaborate work on plumbing as he thinks it should be done. This book is full of crudities, bad methods and poor advice as to appliances and arrangements, Mr. Davies being a man evidently full of his own wrong ideas and determined to enforce them.

W. P. Buchan (1876-1883), a Scotch plumber, gives in his book a short practical account of the English or Scotch methods in vogue, with little effort to make his book more than an elementary treatise.

The writers on the subject in England (with the exception of Latham and Denton, who devote a portion of their works on sanitary engineering to plumbing) have been tradesmen, not professional men, and the books lose for this reason, not having the breadth, scope or literary qualities that might be expected from a professional or scientific man. Hellyer's books are still the best exposition of the English practice, being confined practically to methods of lead piping and descriptions of English appliances. The only modern French work on the subject is F. Liger's "Fosses d'Aisance Urinoirs et Vidanges." This is a thorough description of the peculiar contrivances used at the time (1872) in France, a large sheet-metal pipe extending from closet to a large barrel or other movable receptacle. This portable cesspool when full is removed. The peculiar apparatus for separating fæcal matter from the urine is described, showing how the urine escapes in sewers and how the barrels (fosses mobile) are removed. The apparatus and disposal appear peculiarly antiquated, while the odors which arise from them must be intensely disagreeable. The arrangements described, I understand, are still largely in use in Paris. Other foreign literature on the subject is of little, if any, practical value except as a means of calling public attention to vital matters, either books or pamphlets by alarmists like Dr. Pridgden Teale ("Dangers to Health"), or by physicians who did not understand the practical side of the question, or by inventors or manufacturers who desire to push their wares.

In America the writers are limited to George E. Waring, E. S. Philbrick, T. M. Clark, J. P. Putnam, W. P. Gerhard, J. C. Bayles and myself. The plumbers in this country have done nothing by way of adding literature to advance the trade, and in many instances they have opposed such advances.

The books published in this country do not give more than an elementary or partial treatment of the subject. The majority of them discuss it only from a sanitary standpoint.

Mr. Clark's articles, already referred to, are simply a short series covering the ground in only a general way.

Philbrick in his book treats the subject only as an incident to American sanitary engineering.

J. C. Bayles writes principally of hydraulics and water supply, ignoring what we would call plumbing proper, although the title of his work would indicate a treatise on plumbing.

Waring's and Putnam's books are largely descriptive of their own inventions, many of which have excellent points, but in a treatise on the subject should probably take less space than has been given them.

W. P. Gerhard has written three small works on house drainage, which constitute the best American treatment.

These books are small and cover the ground only in an elementary way, and principally point out their availability from a sanitary standpoint. He practically avoids in his works the question of trap ventilation.

The book I have published describes simply the one subject in plumbing—water closets, and the pamphlet that of trap syphonage.

We have no book descriptive of American plumbing of the same thoroughness that the work of Hellyer gives to the English practice, and at present there is no book which gives more than a partial, local or very elementary discussion of the trade as practiced in our own and other countries. Among the magazines, the *Engineering Record* of New York, formerly the *Sanitary Engineer*, deserves great credit for its determined and persistent advocacy of all real improvements in plumbing, and of the proper systems of piping and ventilation. The care with which all matters are sifted before they appear in this journal is to be much commended. Great credit should be given also to the *American Architect* of Boston, which has published many articles in this line, and held its columns open for discussion.

Other magazines have used little judgment in the selection of articles; they have been either exaggerated for the purpose of an alarm, have been fulsome puffs of inventions or systems, or show a great lack of knowledge on the subject they have allowed in their columns. This agitation has produced a revolution in plumbing practice during the last ten years. The first and principal gain has been the adoption by the principal cities of plumbing regulations. Although these regulations are not all good, and the best of them are not free from defects, still the worst of them require plumbing which is far in advance in arrangement and execution over the ordinary work in vogue 15 years ago.

PLUMBING REGULATIONS.

Washington claims to be the first city to adopt plumbing regulations. These have been improved from time to time, and last fall they received an extensive revision. Washington now requires all master plumbers, before they can practice their trade, to pass an examination. This I consider a great advance and worthy to be adopted by cities that have not at present put such laws into execution, as it certifies to a plumber having at least a limited knowledge of his trade and a capacity to do his work. The requirement of city inspectors and the testing of pipe systems by water and air are excellent points attained.

A recent improvement in terra-cotta pipes has been increased thickness, depth of hub and ribs in hub and spigot. In all good work in recent years light cast-iron pipe has been discarded, heavy iron being used in its place. Several companies are now testing their cast iron pipe by hydraulic pressure before sending it out. This is a decided gain, as cast-iron pipe of the best make was liable to sand holes and other defects, many of which were covered by the pitch or other coatings. Instead of the old method of cutting holes in pipes of either terra cotta or iron, fittings are now furnished suitable for every contingency that may arise in ordinary practice.

One of the best modern improvements is the introduction of wrought iron and steel pipe with screw fittings, by C. W. Durham, for house sewerage. This gives a rigid piping system in no way depending on floors, which may rupture the joints in ordinary systems by settlement or shrinkage, and at the same time gives an opportunity for absolutely tight joints in pipes and connections with fixtures.

LIFE OF PIPE.

Data as to the life of pipes and effect of coatings in ordinary use have been accumulating slowly. Lead pipe is practically indestructible; many pieces are still in perfect condition that were in use in Rome, Pompeii and other cities 2000 years ago. Iron, which has come into such extensive use during the last few years, is subject to destruction by oxidation. How rapidly and under what conditions this occurs is a matter of importance.

Fresh water oxidizes wrought iron more quickly than it does cast iron, while salt water seems to have an opposite effect.

The rate of wear on wrought-iron supports where subjected to action of air and water alternately is apparently 1 inch in 20 years, as proved by supports on lighthouses. Cast-iron pipe fails from accretions on the inside when used for water supply, peculiar nodules filling the interior of the pipe. This trouble has been encountered in all the cities where cast-iron pipe was first used. This seems to be particularly the case with soft waters. For soil pipe the slime which adheres to the interior seems to protect both cast and wrought iron, and the necessity is to guard the pipe from destruction on the exterior. Where the pipe is

*Prepared for convention American Institute of Architects. Read by courtesy of the institute at World's Congress of Architects in Chicago, August 4, 1893.

subjected to a constant change of conditions—*i. e.*, action of air and water alternately—it deteriorates rapidly. Pipes taken from the streets of Alexandria, Va., laid in gravelly and made ground, buried in 1851 and taken up in 1885, were practically worthless, being soft and easily pulled apart with the hand, while pieces buried in clay soil were perfect.

The city engineer in Philadelphia informs me that he has found the same to be a fact in Philadelphia, and others have noted the same effects. It seems needless to say that paint will protect the exterior if put on before oxidation commences (red lead forming the best first coat), otherwise oxidation will go on beneath the surface of paint. Pitching or asphalting seem to act as a preservative, although there is very little positive data showing how long such coating will protect the pipe. Iron pipe may be obtained dipped in metallic paint; this answers but a short time. Galvanizing is but a trifle more effective. Enameled iron pipe, if the enameled surface can be kept intact (not an easy task), would form an ideal pipe for interior protection. As soon as oxidation commences it chips, and the whole surface is rapidly fluxed off. The Bower-Barff, or rustless iron pipe process (where it is not necessary to cut through the surface, or where it is treated after the pipes have been cut and fitted), seems to have answered its purpose well for both wrought and cast iron during the short time it has been in use, but its effectiveness is weakened by the necessity for cutting and fitting pipes while work is in progress.

THE EFFECT OF PIPES ON HEALTH.

Lead pipe has been traditionally injurious to health from the time of Vitruvius, two thousand years ago, to the present day. In spite of this tradition millions of people have been drinking water through it from that day to the present time, and it seems to be doubtful if one well-authenticated case of lead poisoning by the use of lead pipes has been found.

Lead tanks subjected to the action of air and water alternately are undoubtedly injurious, but the opinion of all experts who have recently examined the question quite thoroughly in France, England and Germany is that lead pipe is not to be feared except in unusual circumstances, to which it is never subjected in actual use.

Paris uses it in 39,500 houses, Berlin in 20,000; yet no case of poisoning could be discovered by a commission appointed to examine into the question. The British Institute of Civil Engineers makes a similar report. Ten million people daily drinking water through leaden pipes would probably be a very low estimate of the fact, and still not a case in a year even attributed to lead poisoning by this means.

(To be continued.)

TRAPS AND VENTS.

E. J. BRADY, plumber, at 58 Warren street, New York, does not confine his sheet practice to metal, but is a yachtsman perfectly at home at the main sheet.

AT BUFFALO, N. Y., there is trouble between the Master Plumbers' Association and the Journeymen Plumbers' and Steam Fitters' Association, the latter having submitted to the former several articles for adoption, which, owing to their unsatisfactory nature, on a vote were returned and the Conference Committee discharged, cutting off further communication.

ROBERT CORNELIUS, who over 40 years ago formed the house of Cornelius & Baker for the manufacture of gas fixtures, died recently at his home in Frankford, near Philadelphia, at the age of 85 years. Several years ago he retired from active business and gained an extended reputation as a grower of fine fruit on his farm.

CORBIN & BEATON are a new firm who are about to start manufacturing plumbers' supplies at Southington, Conn.

THE HEALTH DEPARTMENT at Buffalo, N. Y., is having some trouble with the milk dealers who, from ignorance, fail to comply with an ordinance providing that the drainage pipe from a milk box should run to an open receiver and the receiver connect with the sewer through a trap.

J. H. MCPARTLAND, Houlton, Maine, has sent plumbers to Ashland and Presque Isle to do several jobs of work.

A REDUCTION in the force of plumbers at the Brooklyn Navy Yard brings a charge that points to political complication, but the officers say that this class of labor has by a system of registration been removed from the patronage to be dispensed.

THE JENNISON PLUMBING COMPANY, Leominster, Mass., have closed out their stove business to Webber & Hayward, who continue as agents for the same line of goods in Leominster and Fitchburg.

THE PLUMBERS' UNION of New England, at their convention at Boston, Mass., last week, were found to be in excellent condition, and plans were made for a more thorough organization throughout that section.

A DIFFICULTY between the inspector and master plumbers of Flushing, N. Y., has been amicably adjusted, the inspector resigning and E. G. Roff being appointed to fill the office from September 1.

A MORE RIGID ENFORCING of the plumbing regulations in Pittsburgh, Pa., and the attending experiences, has provided ample excitement for some of the local plumbers and the citizens. Some additional restrictions, it is supposed, will result.

H. M. FIELD, 57 Main street, Fitchburg, Mass., is the address of a new plumbing establishment.

THOMAS P. WATTS, a well-known plumber of Louisville, Ky., is a candidate for alderman.

THE OFFICERS ELECTED by the Master Plumbers' Association of the City of Hartford, Conn., for the ensuing year are: President, James Ahern; first vice-president, Edward Lawler; second vice-president, George Mahl; recording secretary, John S. Craig; corresponding secretary, James F. Duffy; financial secretary, T. Oakes; treasurer, Edward Mahl; sergeant-at-arms, John Smith.

A LITTLE CIRCULAR from the Standard Mfg. Company, Pittsburgh, Pa., shows Young's adjustable boiler stand, which can be readily increased 12 inches in hight and adjusted at each intermediate ½ inch. Many boilers are set lower than the plumber would prefer, owing to the fixed hight of the boiler stands in general use. Better circulation would often be secured if the bottom of the boiler was nearer on a level with the top of the water back. There are many advantages in a boiler stand that can be adjusted in hight to suit the case.

THE PLUMBERS' REGISTRATION BILL, which was presented to the British House of Commons and referred by that body to the Grand Committee on Trade, was returned last week to the House with an unfavorable report on certain points in the proposed measure. It is thought that the bill is killed for the present session of Parliament, and that it will have to be considerably modified in order to get a chance of passing into law.

The largest consignment of gold that ever reached the United States in one vessel was landed from the North German Lloyd Company's steamer "Spree" at New York last week. It amounted to $4,250,000, packed in 126 boxes, the whole weighing some six and a half tons.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

THE old steam heating plant at Yale College, New Haven, will hereafter be used for heating the brick row, Farman, Lawrence and Durfeel dormitories, and a new plant, to cost $50,000, will consist of a new boiler house. Five of the largest boilers ever used in Connecticut for heating alone will be erected for Alumni and Dwight halls and the old and new libraries and the Commons.

IN the next two months a new steam heating plant, at a cost of over $14,000, will be installed in the New York Post Office. The old radiators and pipes that have been in use 17 years are being removed. The steam has been supplied by the New York Steam Heating Company, but after their contract expires it will be discontinued.

THE Westville, Conn., Board of Education has decided to heat the school building with hot water, and appointed L. W. Beecher, M. E. Terrell and Amos Dickerman a committee to select a system and make a contract.

A HEATED discussion and a long session was held by the school board of Eau Claire, Wis., which resulted in the contract being divided, Richardson & Hobbs getting the Alexander School at $1300, the Smead Warming & Ventilating Company getting the Lincoln School at $1000, and Fuller & Warren getting the heating and closets for the Frawley School at $2072.

THE old worn-out heating apparatus in the Jersey City, N. J., High School is to be replaced with a steam heating plant.

THE contract for heating and ventilating the Goodnow Memorial School, at East Princeton, Mass., has been awarded to the Hub Plumbing, Heating & Stove Company of Clinton, Mass., who will use the Smith & Anthony Company's system.

LEARNED & BROWN, plumbers and steam fitters, Waterville, Maine, are installing a hot-water heating plant in that city and another at Oakland.

LE VALLEY & JENKINS of Corning, N. Y., have secured the contract for the heating and plumbing work in a new church and parochial school there.

THE heaters in the Bennington, Vt., graded schools will be replaced by a steam heating plant and the halls will have a similar system.

THE trustees of the academy at Rose Point, Pa., intend improving the heating arrangement of the building before the fall term begins.

WM. MORAN of Titusville, Pa., has the contract for the heating plant for the Oil City Hospital.

A No. 55 VICTOR BOILER, made by the Richmond Stove Company, Norwich, Conn., and 500 feet of radiators will be installed by steam fitter White of Oxford, for heating the almshouse at Manchaug, Conn.

THE new steam heating plant in the Maine Central depot at Augusta was recently completed by W. B. Smiley of Waterville.

Canadian Pacific Railway reports indicate that the crops in the Northwest of Canada will far exceed the yield of last year.

THE LETTER BOX.

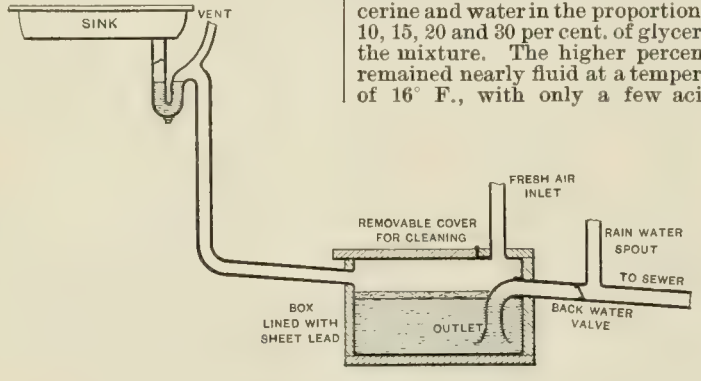
Tool to Re-seat Basin Cocks.

From W. J. H., *Newark, Ohio.*—Can *The Metal Worker* give me the address of the manufacturer of a tool to re-seat bibbs, basin cocks, &c.?

Note.—These goods are usually made on a lathe with ordinary lathe cutting tools, so that it is hardly probable that such a tool as seems to be wanted is made. If any of our readers have devised some quick means for doing such work there are many who would like to know it.

Theory of a Grease Trap.

From YOUNG MECHANIC, *Marshall, Texas.*—Will the plumbers and *The Metal Worker* give me some advice concerning grease traps? I am to fit up a hospital soon and a kitchen sink is desired, but there is a fear that



Theory of a Grease Trap.

grease will stop the sewer. I have tried to explain how this could be avoided by the use of a grease trap, but a doubt exists and more information is wanted concerning the subject than I am able to give. A discussion on this subject would be a benefit to a great many. The sketch shows the simplest trap I know, though in this case cost is less important than a trap that does the work and does not get out of order.

Note.—We give our correspondent's request to the plumbers who have had experience with grease traps. The sketch submitted shows the plan proposed, which corresponds with the principle observed in grease-trap construction. The idea is to provide a trap large enough to receive a considerable discharge of greasy water and hold it till the grease has risen to the surface, where it is held until removed, leaving the water below practically free from grease. The water line in the trap is maintained above the outlet by running the outlet pipe down below the water line and near the bottom of the trap. This allows the clear water at the bottom to pass off without leaving any deposit in the sewer whenever the trap receives a new discharge. The trap tends to cool hot water and harden the greasy accumulation, which floats on the water and is held until the cover is taken off the trap and the grease removed. Frequent cleaning will avoid the possibility of the hardened grease being flushed through the trap or odors arising. The cleaning will be more certain and frequent if care is taken to locate the trap where it can be done with ease. To vent the trap as a precaution is commendable, though not generally done, as the cover is supposed to be air tight.

Glycerine in Traps.

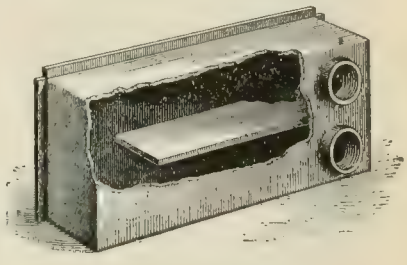
From G. D. HISCOX, *New York.*—Noticing an inquiry in regard to the use of glycerine in traps and air pumps of gas machines in your issue of June 24, a statement of trials may be in order. During the coldest weather of the past winter I tested the freezing condition of various mixtures of glycerine and water in the proportions of 5, 10, 15, 20 and 30 per cent. of glycerine in the mixture. The higher percentages remained nearly fluid at a temperature of 16° F., with only a few acicular crystals of ice, which floated in the mixture. With the lower percentages they were increased in quantity, and with the lowest, or 5 per cent. solution, solid freezing could not be had at 16° F., only a soft, mushy mass, easily stirred, and with no mixture above 3 per cent. could I obtain a solid cake of ice that would endanger the bursting of thin glass bottles. I have recommended a 3 to 5 per cent. mixture for many years in fluids liable to freeze in transportation, wherever its mixture is not objectionable in the use of the articles. I consider it safe and cheap to use in house traps, air pumps for gasoline lighting, and wet gas meters. It does not absolutely prevent the evaporation of the water, but so largely retards it as to make its use desirable. The crude glycerine is not expensive, is odorless, and far preferable in house traps to kerosene, which will saturate a house and furniture with its odor to an offensive degree when closed for a winter season, as our summer residences generally are.

Wants the Plumbers' Opinions.

From M. C. H., *Portland, Maine.*—Will *The Metal Worker* please ask the plumbers to give their opinion on the trapping of water closets? Is it best to use lead or enameled iron for short hoppers?

Trouble With a Water Back.

From J. P. & S. *Haddonfield, N. J.*—In reply to "F. M. B." of Washington, N. J., and others of your correspondents respecting the trouble we had with a water back, as described in *The Metal Worker* of July 17, we take pleasure in saying that we have discovered the cause of the trouble. It was due to a sand hole in the partition of the water back, between the inlet



Trouble with a Water Back.

and outlet pipes, as will be seen by reference to the sketch which we send you.

This prevented the water from circulating as it should. I called at the house this morning, and after a fire was started, in one hour's time the water was very near the boiling point. so that everything is working satisfactorily and the landlady and we are happy. I send this for the information of your correspondents and also in the hope that it will stimulate others to write letters about their difficulties and the way they overcome them.

Size of Outlet for Force Pump.

From W. M., *Point Arena, Cal.*—I have a double-action force pump with 1½-inch suction pipe to connect with a well 20 feet deep, and I wish to elevate the water 75 feet to a tank. What would be the proper size of pipe to use for the outlet?

Answer.—For a pump under the conditions mentioned we think a 1¼-inch pipe would be the proper size to use for the outlet.

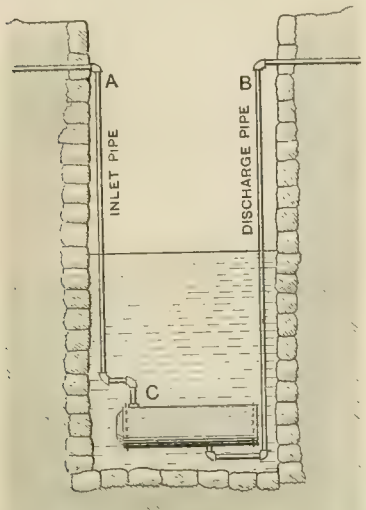
A Question of Discount.

From A. C., *South Manchester, Conn.*—A purchases of B 50 barrels of flour at a given price, less 25 per cent. and 2 per cent. discount for cash. A receives the goods, pays the freight charges, carts the flour to his store, and finding it tallies with the invoice, draws a check to settle the account. The question is, should the freight charges be deducted before or after the discount has been taken off?

Note.—This is a subject which comes up periodically for discussion and concerning which there appears to exist in the trade a difference of opinion. Generally speaking, however, it may be said that the majority incline to the view that the discount should be deducted from the face of the bill and after that has been done take off the charges for freight.

Trouble with a Well Cooler.

From E. D. S., *Atlanta, Ga*.—I notice in *The Metal Worker* of July 1 a communication from "P. R. F.," describing a water cooler with which he had trouble. If he had made his inlet connection at the highest point of



Trouble with a Well Cooler.—Fig. 1.—*Top and Bottom Connections.*

the reservoir he would have overcome all of the difficulty in connection with his cooling apparatus at once. In Fig. 3, which shows the position of his tank, the upper part contains a body of air which cannot escape, and consequently when he draws water at the sink the confined air tries to make its escape, which causes the water to flow or rush at once to the pipe. Let him

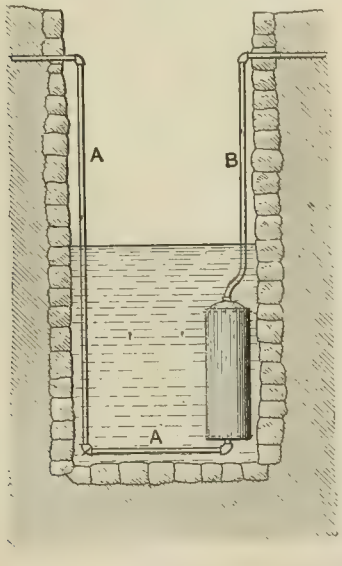


Fig. 2.—*Well Cooler Placed Vertically.*

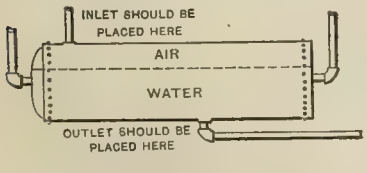

Fig. 3.—*Showing Air-Bound Tank.*

tap the tank at the highest point, as shown, and he will overcome all trouble with his cooler. Or he might adopt the plan shown in Fig. 1, which accomplishes the same result. The best plan, however, is shown in Fig. 2. By placing the tank in a vertical position he gets the full benefit of all the cooling surface.

Capacity of Tanks.

From D. B., *Passaic, N. J.*—Please give a rule for determining the number of gallons square and round tanks will hold.

Answer.—There are 231 cubic inches in a gallon. For a square tank reduce the dimensions of the tank to inches, and multiply the length by the width and the result by the hight, which will give the number of cubic inches in the tank, and by dividing this sum by 231 the result will be the number of gallons the tank will hold. For a round tank reduce the dimensions to inches, then square the diameter, which is to multiply it by itself, then multiply the result by the decimal fraction 0.7854, and the result will be the square inches of area in the circle. Multiply these square inches by the number of inches in the hight of the tank, and the result will be the number of cubic inches in the tank, and by dividing that by 231 the number of gallons will be known. A gallon of water weighs about 8⅓ pounds, and if multiplied by the number of gallons the weight of the contents of the tank is found.

Tapering Furnace Pipe.

From CÆSAR, *Louisville, Ky.*—I notice an article in *The Metal Worker* of August 12 in regard to tapering furnace pipe. Would say that I do not care to enter into any discussion of the question further than to say that the position taken by both parties is untenable, for reasons as follows: First, to taper from 9-inch collar to 12-inch pipe will not give as much benefit as a straight 9-inch pipe, for the reason that you will lose a given amount of heat force through the increased radiating surface of the 12-inch pipe over the 9-inch, and the effect of this loss of heating radiation will most assuredly decrease the velocity of air through pipe. On the other hand, to decrease from a 12-inch collar to a 9-inch pipe, the pipe, under certain circumstances, will choke and the air will refuse to enter pipe at collar at top of furnace, and the pipe will become cold. Now to the original question. If it were obligatory to taper pipe at either end, I would say unhesitatingly to taper from 9-inch collar to the 12-inch pipe, but do not do this abruptly. In a 12-foot pipe I would run a straight 9-inch pipe for 10 feet and then taper the last 2 feet to register. Then I would lose nothing by increased radiating surface, and would keep my velocity of motion, whereas, on the other hand, I would lose by both.

Repairing Stone Laundry Tubs.

From M., *New York.*—Please let me know through *The Metal Worker* if I can get a cement to repair a light brown stone washtub which was chipped on one edge. The stone is 1½ inches thick and the broken place is 1 inch long, 1 inch high and ⅜ inch deep. The piece has been lost.

Note.—The plan usually followed in repairing is to dress out a place so that a piece can be dovetailed in and secured with a cement made of boiled oil and litharge. As the space is so small, if a little fine sand and Portland cement was used with the oil and litharge a quick-setting durable cement would be made and might prove satisfactory.

Contaminated Well Water.

From J. H., *Richmond, Maine.*—Some three years ago I set a pump to which was connected a lead pipe leading to a well 300 feet distant. The water that is drawn through the pipe smells and tastes badly at certain seasons of the year, especially during the spring and early summer, while that drawn from the well with a bucket is all right. What is the difficulty?

Loss of Water from Boiler.

From A. B. K., *Burlington, Vt.*—Replying to letter from "J. & R.," published in *The Metal Worker* of 5th inst., I have the following suggestions to make: If the draw-offs of the heaters referred to are connected with the sewer the probability is that the draw-off cocks leak and the water runs out into the sewer. I have found that the best plan is to disconnect the draw-off from the sewer, leaving it so that the connection can be easily made when required to empty the boiler. Have a tight valve on the sewer side, which should be closed always except when the connection is made and the water is being drawn off. Have another valve or cock on the draw-off pipe near the boiler. If any leak occurs it can be readily seen.

From H. S. & D., *Charlestown, W. Va.*—"J. & R.," New York, complain in *The Metal Worker*, August 5, of loss of water from heating apparatus. They say: "House owners were continually pouring in water. Sometimes the entire plant had to be refilled. Impossible to find leak," &c. In our opinion, based on several years' experience with several different boilers put into scores of jobs, we say that the users of the plant overfired and steamed the boiler and drove the water out. If not, it simply leaked out. The reason they did not find the leak is because they did not search thoroughly enough. There are just two ways to get water out. It cannot vanish like smoke any more than the iron pipes and radiators can.

Warming a Church.

From C. F. S., *Louisville, Ky.*—In regard to the remarks of "W. B. & Co.," Bangor, Maine, about heating a church, noticed in *The Metal Worker* of May 20, would say that I only noted how the plan adopted could be made to heat the church. If I had to place the job originally, I would have made quite a different plan. I write this to set myself straight in the matter.

Paste for Asbestos Paper.

From W. S., *Brooklyn, N. Y.*—If "M. J. H.," who inquired how to secure asbestos paper to furnace pipe in *The Metal Worker* of August 5, will use water in the following manner he will find it satisfactory: Put one end of the paper on top of the pipe and with a sponge wet with clean water, thoroughly soaking it; wrap it around the pipe and rub it with the hand, making a lap of 2 inches, thoroughly soaking the seam. This will be all that is required, and when dry will look as if it was painted.

A correspondent says Day's Diamond Paste, made by the Day Diamond Paste Company, Albany, N. Y., is first rate for fastening asbestos paper to furnace pipes.

THE TIN SHOP.

Pattern for Two-Piece Elbow.

From W. T., *St. Louis, Mo.*—A convenient method of obtaining the pattern for a two-piece elbow is shown in Figs. 1 and 2. The quarter pattern C F G of Fig. 1 is used for marking off the pattern shown in Fig. 2. To obtain the part of pattern shown in Fig. 1 by C F G, proceed as follows: Draw the line A B and erect the perpendicular C D. With C as center, and with one-half the diameter of elbow as radius, strike the arc E F, which divide into any convenient number of equal parts, as indicated by the small figures. From C on C B lay off a stretchout of E F, through the divisions in which draw the usual measuring lines, as indicated by 1′ 1″, 2′ 2″, 3′ 3″, &c. From the points in E F draw lines parallel with A B, cutting lines of similar number drawn from the stretchout line C G, as indicated at 1″, 2″, 3″, &c. A line traced through the points thus obtained, as shown by F G, will form the required part of pattern. To obtain the pattern of elbow, using for the purpose C F G of Fig. 1, proceed as follows: Draw any line, as H J, equal to the circumference of elbow; bisect H J in K, and, using C F G as a pattern, mark off L M N O, as shown, thus obtaining the pattern line P Q R. The part of pattern indicated by S T U V is then to be drawn in the usual manner. Edges for joining are to be allowed on S T and U V. As a matter of convenience the pattern in Fig. 2 is drawn to a reduced scale.

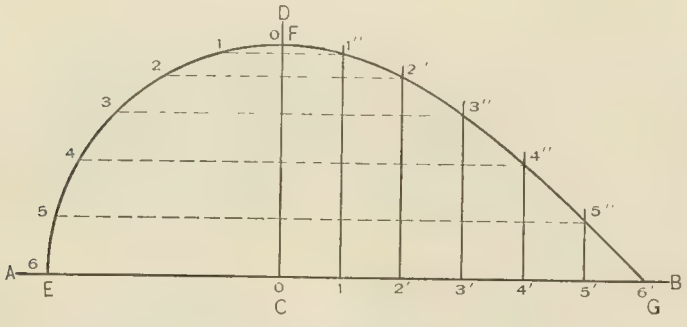

Fig. 1.—Method of Obtaining the Quarter Pattern.

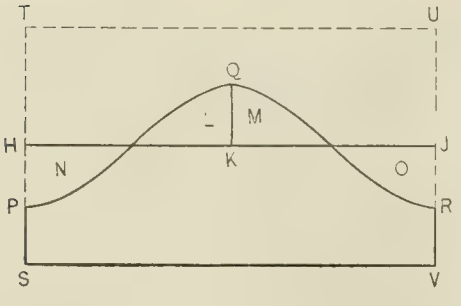

Fig. 2.—Pattern Obtained by the Use of Part Similar to C F G of Fig. 1.

PATTERN FOR A TWO-PIECE ELBOW.

Work Bench Edge Protector.

From L. M. W., *Delaware, Ohio.*—The edge of my work bench having worn out, particularly at the top, I sawed out a strip of it 2 inches wide and fastened in the place a piece of wrought iron 2 inches square. The iron was long enough to rest on two of the bench legs or supports, and I had ⅝-inch holes drilled in it and countersunk very deep, so that I could screw it securely to the bench and not have the heads of the screws project. Before I screwed it in place I cut some holes for some of the stakes in the edge of the bench with a saw, and the iron fitting against them makes the support complete. Since I have had this long, true and strong edge on the bench I have found it of so much value to me that I thought some of the readers of *The Metal Worker* might be glad to know of it.

A decision favorable to the Chicago Power Supply & Smoke Abating Company has been given by the Chicago courts, permitting them to proceed with the work of laying a conduit through the business part of the city for the supply of compressed air at 100 pounds per square inch. The air will be sold at a fixed rate for power purposes and for ventilating theaters, schools, hospitals, &c.

Radiant Heat.

The remarkable results obtained by Professor Dewar from the use of high vacua as a means of preventing the transfer of heat have not yet excited the attention the discovery deserves, says the London *Engineer*, probably because the importance of it has been masked by the brilliant and exciting investigations which have ended in the liquefaction of air and oxygen on a comparatively large scale. There can, however, be little doubt that when men of science have time to sit down and quietly digest the information which Professor Dewar has supplied they will see that the fact that oxygen can be liquefied is as nothing compared to the fact that heat cannot jump over what may be termed an empty space with anything like the facility hitherto supposed. If this be true—and there is really no reason to doubt it—the whole theory of radiant heat requires important modifications, and nearly all the elaborate mathematical investigations that have been based on this theory become worthless.

Radiant heat has long been regarded as the analogue of light. A body surrounded by other bodies of a different temperature either gains or loses heat, tending always to the condition of equilibrium with its surroundings. The text-books tell the student that when a body cools it is parting with its motion, and sending, according to the undulatory theory, waves through the ether. While it was thought that caloric was itself a fluid, it was believed that this fluid streamed away from a cooling body through space. When caloric disappeared from the realms of science, ether waves took its place in discharge of numerous functions, and not the least difficulty or hesitation was experienced in explaining what heat radiation is. The similarity existing between it and light was demonstrated, for example, by the well-known concave mirrors, glowing charcoal and lump of ice experiment. The precise amount of heat radiated from the sun has been calculated in terms of cubic miles of coal burned per minute, and so on. Professor Dewar now comes forward and proves that the ether alone cannot transmit heat at anything like the rate commonly postulated. At one stroke he has robbed the mysterious ether of half its virtue. The sun is, perhaps, not cooling at all, perhaps cooling at an infinitely slow rate. The whole cosmical theory, built up with so much care on a foundation of secular cooling, vanishes into thin air. Lord Kelvin and his co-workers will have to begin all over again and formulate new theories, and all because Professor Dewar has shown that heat cannot pass in the way hitherto supposed the apparently insurmountable barrier offered by a few inches of space in which exists the nearest approach to a vacuum.

It has been known for years, although little has been said on the subject, lest, we suppose, the minds of students should be unsettled, that the undulatory theory of light is very nearly as unsatisfactory as a theory can be. It breaks down completely over double refraction, while it leaves everything to be desired as regards metallic reflection. Lately it has been shown, too, that the idea that undulation can take place in an absolutely continuous fluid is open to question, while the theory that the ether is discrete or molecular involves difficulties not less important, though different in kind. It would seem now that the apparently firm ground on which the phenomena of radiant heat rested has been cut away, and that the ether—useful servant-of-all-work as it has been—can no longer serve our turn to the extent supposed. As it has failed to account for all the peculiarities of light, so now it fails to explain those of heat.

It will, perhaps, be argued that, although the ether cannot transmit dark rays of heat, it can transmit light rays, and that, as a consequence, the sun can send heat to the earth and into space. We do not possess sufficient information as yet to be able to speak positively on this point; nor is it, indeed, necessary. Professor Dewar's far-reaching discovery—we say "discovery," because there was no good reason to assume beforehand that empty space could be much superior to a gas at rest as a non-conductor—supplies sufficient food for speculation as it stands. Let us take it for granted that only dark heat is preserved in a planet, and we see that even with this limitation the geological and astronomical phenomena involved are of stupendous influence. If there is no gas in space, nothing but the mysterious ether, then this earth, for example, cannot have cooled in the way hitherto supposed, by the radiation of heat into space. It may be answered, of course, that we know that the sun radiates heat because the world is warmed by his rays. That he transmits energy to us in some way across space is certain, but is it at all certain that it has any existence at all as heat in space? To illustrate what we mean, let us suppose that a stream of shot was suffered to fall from a lofty tower on a metal plate. The plate would be heated, but it would be very incorrect to say that the heat had been sent as heat from the top of the tower. Clerk-Maxwell, writing on radiant heat, says: "Substances which admit of radiation taking place through them are called diathermanous. Those which do not allow heat to pass through them without becoming themselves hot are called athermanous. That which passes through the medium during this process is generally called radiant heat, though as long as it is radiant it possesses none of the properties which distinguish heat from other forms of energy, since the temperature of the body through which it passes, and the other physical properties of the body, are in no way affected by the passage of the radiation, provided the body be perfectly diathermanous." It is quite possible to conceive, not only that the sun's energy has been transmitted to us in a form bearing no resemblance to heat, but, again, that the amount of energy thus lost by the sun is limited by the planets or other bodies on which it is expended. That, in other words, if the planets were annihilated, the sun would no longer lose energy. These and various other speculations suggest themselves as a matter of course. To answer them finally, yes or no, is not yet possible. It is to be hoped, however, that Professor Dewar will extend his investigations on the relations obtaining between high vacua and heat transmission. In every-day life the engineer is perplexed with problems which have never yet been solved. For example, why is it that the radiant heat in a fire box is of such great value as a steam maker, and yet that, whether we use it or not, so little effect appears to be produced on the temperature in the smoke box? The whole subject of radiant heat has been in a most unsatisfactory condition from the first. Professor Dewar has found confusion and left chaos. Let us hope that out of the ruins will be built up a really satisfactory and substantial structure; but this cannot be done until the true import of the Royal Institution experiments has been realized by our scientific world.

It must be supposed, however, that Professor Dewar goes so far as to assert that heat cannot be radiated at all across a vacuum. He holds that the expression, "radiant energy," must be confined strictly to vibratory energy transmitted by the ether, as distinguished from the transference brought about by gaseous matter. The true bearing of his discovery seems to be this: Hitherto it has been held that the radiation of heat, as in a fire box, was effected almost, if not altogether, by the ether, and that the clear, transparent gas, such as carbonic acid, rather tended to check radiation than to promote it. Professor Dewar's experiments go to show, however, that this view is mistaken, and that if there was a perfect vacuum in the fire box above the glowing fuel, only very little heat indeed would pass to the plates, although real radiation would not be stopped. The rate of cooling of suns and planets surrounded by a gaseous atmosphere held to them by gravity, while space is absolutely empty of matter, must be an enormously complicated question, the solution of which is, at present at all events, quite beyond the powers of the mathematician.

The Weehawken tunnel of the West Shore Railroad (in New Jersey), which is 4200 feet in length, has been fitted with a novel block-signal system, described in the *Engineering Magazine*, consisting of a line of incandescent electric lamps about 300 feet apart and placed on a level with the eye of the engine driver. When the lamps are all alight it is an indication of safety; each train passing through extinguishes the lamps for a distance of 1100 feet in its rear, a result which is automatically effected by an electrically connected track circuit, whereby the lamps are kept under the continuous control of the train. The operators in the signal towers at each end of the tunnel can also extinguish the lights in any section of the tunnel if occasion requires. This system appears to embody a number of exceedingly valuable features, and, if successful in practice, cannot but increase the traffic capacity of a long tunnel largely beyond that which is possible by the methods of signaling heretofore in use.

One of the largest steamboats in the world was launched on Thursday, August 10, at the shipyard of the Delaware River Iron Ship Building & Engine Company, formerly the John Roach shipyard, at Chester, Pa. The vessel has been built for the Fall River Line and is named the "Priscilla." The boat, which is larger than the well-known "Puritan," is 424 feet on the water-line and 440 feet over all. Her width is 52 feet 6 inches, draft 12 feet 6 inches, and total displacement about 4550 tons, with cargo capacity of 800 tons and passenger capacity of 1400. The hull of the vessel is built of steel, with 52 water-tight compartments, and she will be furnished with double inclined compound engines, with 8500 indicated horse-power. The design of the "Priscilla" is due to George Pierce, supervisor of the Fall River Line, and the engines were designed by Andrew Fletcher of the North River Iron Works, Hoboken. The vessel will receive her engines and be finished in New York.

According to a recent statistician the United States produces 2220 pounds of grain to each inhabitant; Denmark, 2205; Canada, 1500; Russia, 1200; Roumania, 1150; Spain, 1100; France, 990; Sweden, 980; Argentine Republic, 750; Australia, 760; Germany, 700; Belgium, 600; Portugal, 550; Ireland, 500; Scotland, 490; England, 360.

The following table gives the total value of exports of leading domestic products from the United States for two years to June 30:

	1892.	1893.
Cotton, raw	$258,461,241	$188,766,274
Breadstuffs	249,363,117	199,034,203
Meat and dairy products	140,362,159	137,031,669
Cattle, sheep and hogs	35,624,281	26,541,801
Mineral oils	44,805,992	42,077,770
All other articles	237,115,221	237,339,013
Total	$1,015,732,011	$830,790,730

Cargoes of all descriptions are unusually scarce on the lakes and there is general mention of vessels laying up till better times.

Impending war in the wall-paper trade is rumored on account of the alleged efforts of the National Wall Paper Company to boycott the manufacturers who do not work with that combination. The company are said to control 80 per cent. of the entire output of the United States, and it is claimed that they have secured almost the whole trade of the country by offering premiums to such jobbers and retailers as purchase their supplies exclusively. The 20 per cent. of outsiders are now combining to fight the consolidated corporation.

Rice cultivation is strongly recommended by the Agricultural Department in certain sections of the South, particularly in Southwest Louisiana, where there are hundreds of thousands of acres lying idle which are admirably adapted for raising this cereal. As rice forms the staple food of more than two-thirds of the human race a market for all that can be grown will never be wanting.

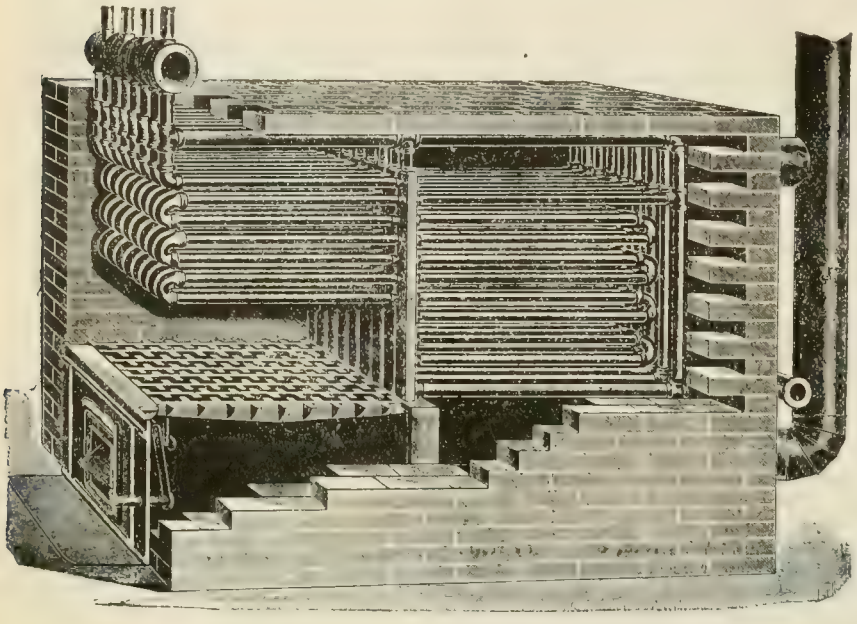
The August Government crop report for the United States shows a decline in the condition of nearly all agricultural productions except hay, due mainly to the drought which has prevailed in most parts of the country.

Western farmers are anxious to ship their hay for export to Europe, but as they want fancy prices for it, shippers will not take hold. No domestic hay has consequently been exported yet, although Canada is sending her's abroad in great quantities through the New York bonded warehouses.

STEAM AND HOT WATER.

The Electric Heating Boiler.

We print herewith illustrations of the Electric heating boiler manufactured by the Electric Boiler Company of Rochester, N. Y. The boiler is made for both steam and hot-water heating, the annexed illustrations showing the boiler as adapted to steam, the construction, however, being closely similar to the form they employ for hot water. Fig. 1 is a view of the boiler with the brick setting broken away at the side, showing the arrangement of the sections and their position in relation to the fire. This boiler is finished with cast-iron front and the usual trimmings of steam gauge, water glass, damper regulator, &c. Fig. 2 is a side view of a single section with the waterways broken, showing the relation of the steam and water spaces, and also by means of the arrows indicating the course of the products of combustion. Referring to Fig. 2, it will be seen that the sections consist, first, of a heavy iron stand pipe, N, into which wrought-steel tubes are screwed with right and left hand threads, and with return bends, *b*, at the opposite ends. The bends are so arranged that they bring the top pipe of one pair opposite the bottom pipe of the opposite pair in such a manner, it is explained, as to secure to some extent a continuous circulation of water. Each stand pipe with its complement of tubes forms a section. From the bottom of the rear side of the stand pipe a tube, *cc*, extends to without the brick setting, where it connects with a flanged tee or cross, the tees and crosses being bolted together, forming a header, R, to which the return pipes are connected. The top tubes front and rear are carried up and connected with an eduction pipe, B B, as is likewise a tube from the top end of the stand pipe. These eduction pipes, as they are called, form the top of the combustion chamber. They extend out through the top of the boiler covering near the front end, where they are connected with the flanged tees that are bolted together, forming a flow header, *s*, from which the flow pipes are run. By this arrangement of sections it is pointed out that each section is practically a separate boiler with its own circulation. By varying the lengths of the tubes and the number of sections boilers of various sizes can be furnished. It is pointed out, furthermore, that this system of connecting renders it easy to repair the boiler. The tubes are arranged in a partially staggered form so as to present the greatest surface to the action of the heat and at the same time to produce as little friction as possible in the smoke passages. The products of combustion rise through the vertical rows of staggered tubes on the front of the stand pipes, as shown in Fig. 2, pass over between the top ends of the stand pipes and the eduction pipes and between the short tubes connecting the two; then into the rear combustion chamber and down through the tubes to the smoke pipe, leaving the boiler where the water is coolest. The smallest boiler consists of four sections, has a grate surface 12 x 12 inches, a heating surface of 28 square feet and a capacity with hot water of 200 square feet, and with steam of 160 square feet. In these boilers there are ¾-inch tubes 12 inches long at the front and rear of stand pipes. A similar set is made with tubes of the same size 15 inches long, 18 inches long, 21 inches long and 24 inches long. They are likewise made of 1 inch tubes 30 inches long, front and rear of stand pipes, 36 inches and 42 inches; 1¼-inch tubes 36 inches long, front and rear of stand pipes, 42 inches, 60 inches and 70 inches; 1½-inch tubes 48 inches long, front and rear of stand pipes, 60 inches, 72 inches, 84 inches and 96 inches. From the above particulars it will appear that a very extensive variety of sizes is furnished of the Electric boiler.



The Electric Boiler.—Fig. 1.—View of the Boiler with Setting Partly Removed.

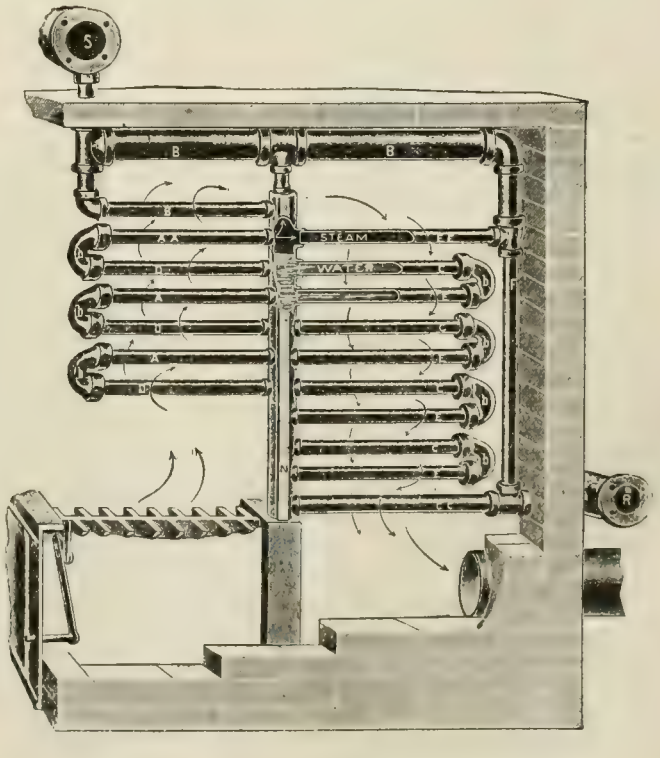


Fig. 2.—Side View of Single Section of Boiler.

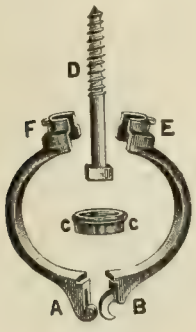
O. K. Pipe Hanger.

Patents are being secured by T. B. Cryer & Co., Newark, N. J., for the O. K. pipe hanger, which is shown open for use in Fig. 1 and closed as in use in Fig. 2. It consists of a gimlet-pointed square-headed lag screw, two pipe clamps and a yoke for the clamps. It



O. K. Pipe Hanger.—Fig. 1.—Hanger Open.

permits of all the lag screws necessary for a line of pipe being screwed in position and the pipe being propped under them; then the clamps can be placed around the pipe and over the head of the lag screw, to be secured by the yoke. Then a pipe wrench can be used on the lag screw, turning it to raise or

Fig. 2.—Hanger Closed.

lower the pipe till it is in proper line. The hanger is made in sizes for pipe from ¾ to 10 inch, and the lag screws are furnished 4, 6, 9 and 12 inches long.

HEATING NOTES.

At a meeting for discussing the rebuilding of the Tremont Temple, at Boston, this fall, it was announced that arrangements would be made for ventilation on an improved plan, furnishing 50 cubic feet of air per minute for each person.

A neat circular, with the trademark of the Royal heating apparatus at the top, comes from Hart & Crouse, Utica, N. Y., announcing that they have retained W. M. Mackay, who will have entire charge of their steam and hot-water department, with headquarters at 236 Water street, New York.

The March-Brownback Stove Company, Pittston, Pa., issue an attractive illustrated circular respecting the Crown steam heater. The publication is of oblong size and is neatly bound in paper, with title and other information on the front cover in black and red inks. There are but eight pages in the circular, which, however, are sufficient by means of text and illustration to explain the chief features of this steam-heating apparatus. A general view of the boiler is shown, likewise a view of the grate. Then come sectional and other views, together with which are full descriptive particulars. One page is given up to a table of dimensions and prices, the boiler being made in five sizes with diameter of fire pot from 18 to 30 inches and adapted to heat from 275 to 1200 square feet of radiating surface. In addition to the description furnished some other serviceable information is presented. Along with the pamphlet is an estimate blank that will be useful to those who wish estimates furnished on heating houses.

The Holland Radiator Company, 89 Lake street, Chicago, are to double the capacity of their works at Bremen, Ind. Among the improvements is a new addition, 68 x 58 feet, to be used as a molding room, in which will be placed a large cupola having a capacity of 6 tons of iron per hour. This, in connection with the cupola in use, will give a total capacity of 12 tons per hour. A fire-proof building 40 x 26 feet is to be erected that will be used entirely for core making. The present capacity of the works is 300 radiator loops per day, and as soon as the improvements are made additional men will be put to work, and 600 loops will be the daily product. The company state that large contracts for radiators have been taken in New York, Boston, Chicago and Sweden.

Frank B. Dyche has been appointed receiver for the Rice & Whitacre Mfg. Company, manufacturers of engines, boilers and steam and hot-water appliances at 47 South Canal street, Chicago. The application was made by Emma L. S. Rice, one of several in whose favor the company confessed judgments on the 8th inst., for amounts aggregating $14,275. The company were organized with a capital stock of $60,000 and claim present assets approximating this amount. No estimate is made of the liabilities beyond the general admissions of the concern's inability to meet their obligations.

Burmese Tin Mines.

In the *China Review* E. H. Parker gives an interesting account of the tin mines of the Maliwun Peninsula, in the extreme south of Burmah. Victoria Point, he says, is the southernmost extremity of the Indian Empire in this direction. The Pakchan River is for 50 miles or so the boundry between the British possessions and Siam. The population of the peninsular tract is entirely Siamese, Malay and Chinese, and Burmese is as little spoken as Burmese faces are rarely seen. A pathway has recently been made from Victoria Point up to Maliwun, which is the chief center of the tin-producing industry, and this pathway also runs north of Maliwun to the highest point of sea-going steaming navigation; but, with the exception of this path, the country is one dense mass of mangrove swamp and impenetrable jungle, the haunt of rhinoceros, elephants, bison, wild cattle, sambur, tapirs, tigers, leopards, and other wild animals. On the opposite side of the river is Renong, a Siamese province under the rule of a Chinese rajah, whose intelligent government has changed the country from a mangrove swamp into a nutmeg garden and a tin-manufacturing center. The Pakchan River is very pretty; densely-wooded hills in the distance on all sides from a very agreeable background to the tangled masses of virgin mangroves. The steamer enters a tributary called the Maligun River to the left, but 17 miles from the mouth, and anchors a mile or two below Maliwun creek, the haunt of alligators. Maliwun is a thriving village of perhaps 50 houses, mostly Chinese. There are two tin-smelting houses, where during the smelting season 7 hundredweight of tin can be smelted in a day by each furnace with four or five men. The total annual production of clean tin at present is about 50 tons a year. The smelting apparatus is extremely simple, and is like that used by the miners of Perak. A mud furnace, just like a wine barrel, bound round and crossed with iron hoops, with a bellows consisting of a hollow tree fitted with a piston and connected with the furnace by a short bamboo tube let into a mud tunnel, is all. The whole only costs about $25 when new. One man drags the piston to and fro, but as this is hard work he has to be relieved every hour or two. Another man does the stoking, putting in the charcoal, tin, and slag for resmelting at the top. Out of a small hole in the bottom, on the side opposite the hole connected with the bellows, runs the tin, which is allowed to collect in a hole in the ground, and is then shoveled into two molded holes in the sand, made by working a wooden mold, like a huge brick rounded on one side, into the sandy soil. Nothing could exceed the extreme simplicity and economy of the whole arrangements, and hitherto no foreign machinery has ever been able to cope with them for a moment in an economical sense. The chief smelter is a Malay-Burmese widow, who, after refusing several eligible suitors, including one or two Europeans, has at last bestowed her hand upon an industrious Chinese. Another enterprising Siamese widow owns the spirit license, and after long reflection is about to bestow her hand upon a second respectable Chinese. In Burmah the women do nearly all the trade, and Burmese influence has thus affected these Siamese and Malay born ladies. There is a stream of beautifully clear, fresh water running through the town. The Chinese population of Maliwun, including the mining villages up country, is about 120. All seem to live together in a very friendly way; there is very little crime, and not much trouble in connection with the opium and gambling laws. At Maliwun there is a police station with eight Goorkhas, and a tumble down courthouse. A walk of 2 miles through a very pretty country brings one to the first tin washing. It is alluvial, and the Chinese simply dig away the superficial soil, and throw the under part laden with tin into a series of wooden sluice boxes, sometimes with a ledge at the bottom; the tin sinks, while the lighter portions are carried away. Very little tin is lost, as rakers or scrapers are employed to keep the tin up, and those fragments which escape the first are certain to sink before they reach the last sluice box. The path from this mine to the second and third is rough. Parts of it are always under water, much of it lies over jungly hills, and all of it is slippery in wet weather. The leeches, too, are very persistent and have to be picked off at every stoppage. After a leech bite the blood does not stop flowing, but forms a huge clot on one's clothes, and it is said to be better not to stop the bleeding so as to "let the poison run out." At the second mine there is an old Chinese patriarch. He is 75 years of age, and has been 40 years in the country, smoking opium steadily all the time. He keeps a drug shop, and seems to be very much respected in the neighborhood.

WORLD'S FAIR NOTES.

The Ferracute Machine Company,

of Bridgeton, N. J., have a large exhibit of their presses, spinning lathes, and other sheet-metal machinery, as well as a number of dies, at the Columbian Exposition. They are located in the center of Machinery Hall Annex, columns I, J, 42. Their space is about 30 feet square, and they have a small auxiliary space on the center aisle also. They show two large drawing presses, a large double-crank press, three of their new style of C presses, two punching presses and a number of foot, screw and drop presses, two spinning lathes, beaders, threaders, crimpers, &c., in operation daily. They are manufacturing a number of small goods in aluminum, brass and tin, thus illustrating the working of the presses to the best advantage. All of these presses are from their latest designs and with a number of improvements in the way of new clutches and adjustments, convenient clamping arrangement for setting dies, &c. Their exhibit is driven from a line of shafting of their own, and an independent upright engine gives them their motive power.

There are a number of dies in operation which are of special interest to the sheet-metal trade, in the manufacture of cups, plates, pans and small fancy goods. They also show one of their embossing presses and one of their coining presses, which are adapted for medals, badges and fancy work of various kinds. They also show on their wall space a great variety of articles in sheet metals which have been manufactured in their presses and dies. Among these may be specially noted sheet-metal shingles in numerous patterns and shapes, a variety of vessels showing deep drawing and stamping, cans of many sizes, fancy metal boxes, sheet-metal ornaments, &c. Towering above the exhibit is a revolving vertical shaft, on which are two great signs at a right angle with each other, bearing the name of the company and attracting attention to the display.

They have a neat office fitted up in connection with their space, and will be glad to welcome any one in the metal-working trades at any time. Mr. Hoffman, foreman of the press department, is in charge of their exhibit, and Mr. Stevenson is in charge of the dies, running presses and manufacturing the sheet-metal goods. Their whole exhibit is a very interesting one. They are about to issue a new catalogue describing their new lines of presses.

The Peck, Stow & Wilcox Company,

27 Chambers street, New York, whose factories are at Southington, Plantsville and East Berlin, Conn., and at Cleveland, Ohio, make a fine exhibit of tinners' machines and tools in Machinery Hall, column A 51. The machinery shown comprises an 8-foot square shear for foot power, a 31-inch square shear for foot power with automatic clamp and double-edge blades, a machine for cutting and folding tin or sheet metal for map binding, a 3-inch roll former with slip roll and duplex compensating gearing, a 2 inch slip roll former with compensating gearing and quick roll adjustment, a beader, 30-inch groover, rim machine, stake holder with stakes, incased machines, Columbian machines, 20-inch folder with quick-moving gauge, 30-inch folder with square box attachment, bench scroll or slitting shear, right and left hand ratchet drill, and flat and round nose and side cutting pliers. They also show the Little Giant and Triumph meat cutters. The small tools are shown attached to benches of hard wood, in position for operating. A large showcase contains fine specimens of small tools of the company's manufacture, comprising ratchet bit braces, pipe pliers in a variety of sizes, an assortment of pincers, auger bits, draw knives, bevel-sided chisels, wire pliers, compasses in great variety, hatchets, tinners' and other hammers, and Robinson's wrenches in all sizes.

Ellwood Ivins Tube Works,

528 North Tenth street, Philadelphia. These are seamless tubes, made of various kinds of metal, such as steel, brass, copper, German silver, aluminum, aluminum bronze, &c. The sizes shown run from 2 inches down to almost the diameter of a hair; but the statement is made that larger sizes can be furnished as desired, and of any commercial metals. All are made without solder, seam or weld. A peculiarity of the process is that the walls of the tube can be made of any thickness desired, so that the tubes will be heavy with small calibers or very light with merely walls of shell. They are guaranteed true and accurate, even the smallest sizes being made accurate to the thousandth of an inch. The exhibit is a remarkable one and worthy of a more conspicuous position. No description of the process employed is given in connection with the samples shown.

The Kilbourne & Jacobs Mfg. Company

of Columbus, Ohio, have two exhibits, one being composed of trucks, wheelbarrows, &c., in Transportation Building, section A–12, and the other being devoted to wrought-steel sinks, in the Manufactures Building, section N, block 4. The exhibit in the Transportation Building consists of a large variety of warehouse and store trucks, barrel trucks, cotton trucks, and baggage trucks, to meet any requirement, the warehouse and store trucks being of different patterns to conform to the peculiarities of the trade in different cities; box trucks, consisting of a heavy frame on casters, for moving boxes and other bulky freight; the Little Giant truck, for handling light packages; stove carriers, which can either be used as trucks or for carrying stoves from one location to another; book and paper house trucks, wire-nail wagons, bar-iron trucks, sheet-metal trucks, machine-shop wagons, and a great number of special trucks for a variety of purposes. There are also hand carts, with and without springs, in numerous styles. The Boss solid steel drag scraper and the Columbus steel ditching scraper are among other products displayed, as well as wheel scrapers. Very heavy contractors' plows are shown, while the line of wheelbarrows exhibited comprises an unusual variety of these useful articles, adapted to about every form of work to which a wheelbarrow can be put, including charging barrows for blast furnaces. The exhibit in the Manufactures Building shows the Columbus wrought-steel sink, enameled in different colors. It is also furnished galvanized or painted. These sinks are each made from one plate of steel, pressed into the proper shape, and are thus not only seamless but are very light, strong and durable, as they will not break in shipping or handling, nor from exposure to sudden heat or cold. The bowl and projecting thimble are stamped in one piece from the same plate, enabling the strainer and pipe to be satisfactorily attached. The company have their own coupling to connect the pipe to the sink, which is not only simple but is stated to be thoroughly reliable, avoiding all leakage.

Randolph & Clowes

of Waterbury, Conn., having branch offices in New York, Philadelphia, Boston, Cincinnati and Chicago, have two exhibits. One in Manufactures Building, section N–62, is devoted to Brown & Bros. patent seamless drawn copper range boilers, of which this firm are sole manufacturers. These boilers are shown mounted on boiler stands, and are beautifully finished, being polished until they look like gold. One of the boilers has been cut in two, vertically, to show the interior construction as well as the uniformity in thickness of the shell. A spiral rib runs round the interior of these boilers their entire length, stiffening the shells and supporting them so that the firm guarantee that they will not collapse. Some of the boilers are nickel plated. The exhibit is a fine one, rendered more attractive by the well-finished hard wood floor and the elegant brass railing inclosing the space. The exhibit in the Mines and Mining Building is in the east central section, and is one of the most unique and conspicuous exhibits in the building. They have built a pavilion some 25 feet square and 16 feet high with walls composed wholly of seamless tubing of different diameters running from large tubes on the corners to small ones in the centers. These tubes are of copper, bronze and brass, arranged regularly in that order, making an alternation of colors. On the top of each corner is a dynamite shell, such as were made for the "Vesuvius," dynamite cruiser. Ornamental panels of brazed tubing are arranged in various places about the upper part of the pavilion, also highly polished specimens of copper bottoms, sections of distillers' coils for worms, &c., attached to sheets of planished copper. Inside the pavilion is a rack composed of R. & C.'s patent beer-cooling tubes, which supports a number of spun brass and copper kettles of different sizes. On a large table extending along one side of the inclosure are shown a great variety of the firm's products in sheet brass, German silver, sheet copper, &c. Among the goods shown are brass moldings of new design, and specimens of the new R. & C. brass plumbers' ferrules, made by an entirely new process, to take the place of the old cast ferrule and thus save plumbers much time and labor. They are made perfectly smooth, exact to size, and are carefully tested by hydraulic pressure to 500 pounds to the square inch. Some are plain and others have the ends tinned ready for instant use. The space about the pavilion is inclosed by brass chains attached to posts composed of dynamite shells set on end. The brass signs used on these exhibits are unusually wide specimens of sign brass, being 42 inches wide.

Negotiations are going on between the governments of Great Britain and the United States for the establishment of an international system of removing the floating wrecks which are a menace to transatlantic navigation. It is proposed that the two governments should each detach two vessels for the purpose of clearing the ocean track of such derelicts.

THE RETAIL STORE.

The Security Dust Pan.

The National Handy Article Company, Louis and Campan streets, Grand Rapids, Mich., are manufacturing a new dust pan, which is herewith illustrated, Fig. 1 showing it ready for use. It has a long handle, enabling the user to sweep up all dust while standing. It is so constructed that a slight pressure on the handle will make a close contact on the floor, and the bail is so attached that when raising the handle the pan tips up in front, the sweepings

Fig. 1.—Security Dust Pan.

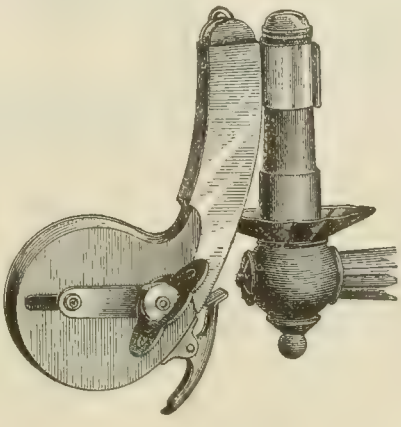
dropping down into the inclosed back, securing the dust from spilling or blowing away. It is described as obviating the necessity of stooping or kneeling and exerting heavy pressure to keep

Fig. 2.—In Position to Carry.

the pan tight to the floor, while trying to use the broom with the other hand, in an awkward and ineffectual manner. The point is made that the pan not only saves stooping, but provides for carrying the sweepings away without spilling them.

Magic Gas Lighter.

Magic Introduction Company, 321 Broadway, New York, are introducing the Magic gas lighter, illustrated herewith. As shown, the gas lighter is



The Magic Gas Lighter.

attached to a burner by means of clamps, which are sprung around the burner near the top. A roll of tape having a series of igniting pellets at intervals along its surface is contained in the bottom of the lighter. One end of the tape runs up and over a roller at the top of the lighter, then down, and is attached to the axle of a turn key. When the key is turned the tape is moved, bringing a pellet in contact with a steel point at the top of the burner, producing a flash of light. The light thus produced ignites the gas, it having been turned on before the key was turned. When the pellets on the tape are exhausted another tape may be introduced into the lighter.

The point is made by the manufacturers that the lighting is done without the use of matches or electricity, and with no danger of burning carpets with match ends; also, that the gas may be turned off when leaving the room and instantly lighted when returning. The lighter is recommended particularly for bedrooms, dark halls and bathrooms. The entire length of the lighter is less than 3 inches, and the goods are neatly finished in nickel plate.

The Perfect Scraper or Cleaner.

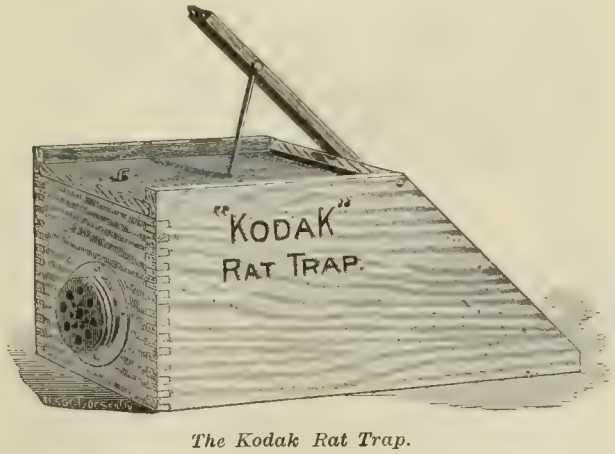
The accompanying cut represents the above article, put upon the market by Corbin & Co., Owego, N. Y. The scraper or cleaner consists of a piece of sheet steel of different angles and curves, conforming to the shapes of the articles to be scraped or cleaned. This revolves in a metal handle; thus the edge desirable to use can be instantly applied. The scraper is fastened to the handle by an open rivet, by which it can be hung up. The scraper is designed to remove burnt, incrusted food or other substances from cooking utensils of iron,

The Perfect Scraper or Cleaner.

tin, porcelain, earthenware or wood, and is also recommended for removing dough from bread boards, paint from window glass, old varnish from wood, &c. The point is made that its use avoids the danger of cutting arms, hands or wrists, as often occurs when using knives.

The Kodak Rat Trap.

The accompanying cut illustrates a rat trap put on the market by Waddel Wooden Ware Works, Greenfield, Ohio. The trap is described as being made of sugar tree wood, without any springs,



The Kodak Rat Trap.

about 10 inches long, 5 inches high, weighing 1½ pounds. The perforated screw cap is designed to serve several purposes. It may be removed to bait the trap; it gives the rat an opportunity of smelling the bait through the cap; the rat being lured into the trap attempts to get out where daylight is seen through the perforations. To set the trap the upright attached to the gate is pressed down and the trigger engaged with a

staple in the end of the upright. It is remarked that by a simple device the gate when thrown is automatically locked. The points of excellence claimed for the trap by the manufacturers are its simplicity of construction, ease in setting, lightness on the trigger, light weight and compact size.

The Self-Heating Washer.

The Self-Heating Washing Machine Company, Evansville, Ind., are introducing the above article, as herewith shown. The washer is described as having the working parts made of oak, the box of hard maple and galvanized iron. The water is put into the washer,

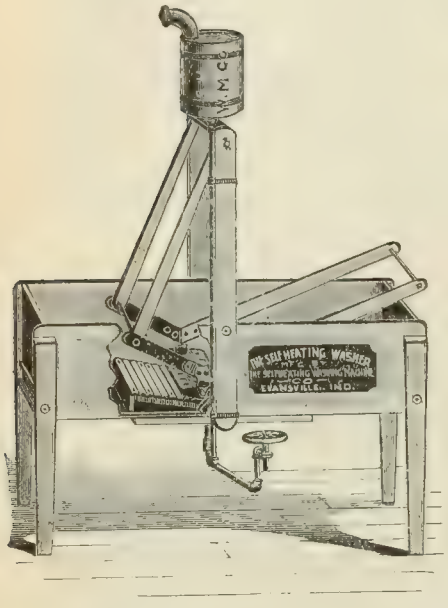


Fig. 1.—The Self-Heating Washer.

where the gasoline burner heats it, and keeps it hot as long as desired. The interior construction is shown in Fig. 1, which, it is remarked, is on the washboard principle, and rubs the dirt out. In operation the clothes are moved over the rollers in the roller bed by the rub board, the latter having holes in it, to

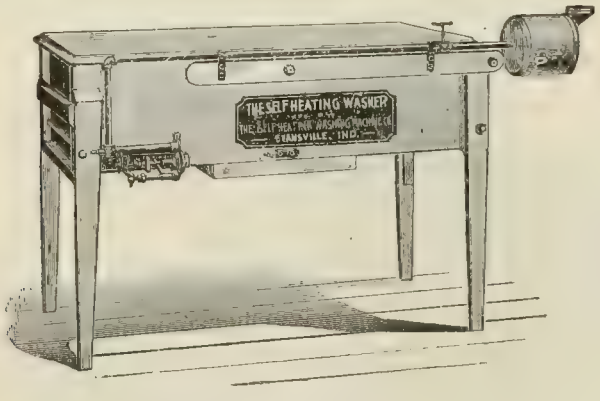

Fig. 2.—The Washer Closed.

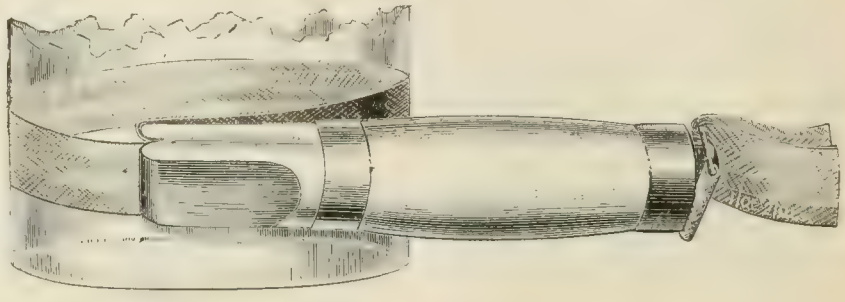
cause the suction to force the hot suds through the garments; this, together with the rubbing, to remove all dirt and streaks. It is pointed out by the manufacturers that the operator can stand erect while using the washer; that a child ten years old can operate it; that it saves lifting clothes on and off a hot stove to boil them; that it obviates the necessity of boiler, tubs, and washboards; that the machine has no geared wheels to be oiled; that the bottom will not shrink and leak in dry weather, and that the washer can be used to rinse clothes in. The burner can be swung to one side and used for making starch, heating irons, &c.

Preserve-Jar Holder.

Francis H. Loss, Jr., 33 Murray street, New York, is introducing the above device, as herewith illustrated.



Preserve-Jar Holder.

A band of strong web material passes through the center of the wooden handle, with an adjustable tongueless buckle at the end of the handle to hold the band, when adjusted to fit various sized jars. The band is marked to indicate where to place the center of the buckle to hold either pint, quart or 2-quart jars. The manufacturers claim that by using the holder all danger is avoided of injury to the hand by jars breaking or of burning the hand when putting up preserves; also that jars can be easily opened, however long a time they may have been closed.

FREDERICK HARDWARE COMPANY, 320 and 322 State street, Beloit, Wis, successors to Frederick & Beach, have until recently been enjoying a very active business, which has followed the remodeling of their store which they bought this spring. Their present quarters are an old hardware stand in the center of the city and were built for the business. The building is some 200 by 30 feet, of stone and brick, with brick division walls and sheet iron doors connecting them. The first 75 feet is used for salesroom, with hardware, tools, &c., on one side, and tinware, forks and farming tools on the other, with stoves, refrigerators and all large bulky goods on the floor in rows, or arranged so as to be most convenient. In the next 30 feet are kept oils, rope, barn-door track, anvils, whiffletrees and goods of that class. The next 40 feet is used for tin shop, and the remainder of the store for the stock of nails, barb wire, washing machines and heavy goods and goods of large bulk. The second floor is for surplus stock of stoves out of season, &c.

Six Months' Bank Failures.—*Bradstreet's* has made a compilation covering the first six months of the current year concerning bank failures. The record given shows that 43 national banks suspended payments permanently or temporarily during the first half of this year, owing, as nearly as has been ascertained, about $23,106,000, and reporting $23,429,000 in assets. The number of State banks similarly situated was 72, with $15,865,000 liabilities and $14,599,000 assets; savings banks 20, with $6,170,000 liabilities and $6,462,000 assets; loan and trust companies 4, with $12,765,000 debts and $5,850,000 assets, and 80 private banks and bankers, with liabilities amounting to $9,383,000 and assets to $8,038,000. There were also 5 mortgage loan and investment companies reported embarrassed, with $1,090,000 of debts and $420,000 assets, while 8 brokers in securities were forced to suspend, owing $1,603,000 and having assets of $692,000. The 43 embarrassed national banks, owing $23,106,000 and having assets of $23,429,000, may be contrasted with 176 State, savings and private banks and trust company banking institutions suspended, owing in the aggregate $40,741,000 and having $30,958,000 to pay with. Aggregates of debts of embarrassed State and private banks and trust companies showed excesses as compared with assets reported.

The outlook for tin mining in Tasmania is said to be very promising. An expert has been recently prospecting, who states that tin deposits exist in West Tasmania of a very rich character. One lode at West Cumberland is from 2 to 15 feet wide, and has been proved to a depth of 50 feet, extending a distance of over ½ mile. With the crudest appliances over 20 tons of metal have been obtained from this mine. In Victoria, Australia, too, the exploitation of tin deposits is being actively carried on with promising results.

The question of accepting part payments of their wages and allowing the remainder to stand to their credit on the books of their employers until the financial stringency is ended will probably be decided among the members of the American Flint Glass Workers' Union affirmatively, and it is probable that by the influence which they will be able to exert the national officers of the union will facilitate the early starting of a number of factories and the employment of thousands of men.

STOVE TRADE NOTES.

The Future of the Hot-Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

THE ARCHITECT AND HIS INFLUENCE.

Some one once asked when the training of a child should begin, and the reply of the sage was: "One hundred years before the child is born." Possibly the training of an architect should begin at the remote period indicated if he is to properly fill his important position, but as that is impossible it is pleasing to note that at the present time in some of our modern universities there are classes in architecture who are giving attention not only to the construction of buildings, but also to the heating of the same by the modern systems. The interest in this branch of their work was recently shown by the class in architecture of the University of Illinois, at Champaign, by inviting one of Chicago's leading architects to address them on the subject. The lecture, an illustrated one, was received by the class with marked attention, and has been recently published and excited no little interest. While treating of all kinds of modern heating in an intelligent manner, that portion devoted to the consideration of furnace heat deserves much praise, as it is rarely that hot-air heating is so ably discussed.

Much has been written and said on hot-water and steam heating, and it is not difficult to place one's hands upon valuable data on these modes of heating, but until very recently it was next to impossible to find anything definite or practical on hot-air heating. There was much theory but few facts to be found in print, and this has had an important bearing on "The Future of the Hot-Air Furnace," for the architect, not finding anything printed in defense of the much-maligned hot-air furnace, has joined hands with the steam and water men in abusing it, and in consequence many clients who looked with favor upon furnace heat were induced to use other systems.

The influence of the architect is usually sufficient to compel the use of such appliances as he may specify, and it is but natural that the client who has placed himself in an architect's hands should follow his advice, for does not the architect know everything about building? He certainly should, according to the ideas of many clients. He should be posted upon the merits of all the different materials that enter into the construction of a building, and should be able to tell at a glance the size, weight and brand of tin plate in a furnace pipe whenever he sees it.

Contractors who do business with architects know the limitations of the knowledge of the latter, and know that with the different things on an architect's mind he cannot be an absolute master of the details of all branches of the building trades, but knowing his influence they should persistently bring the merits of hot air heating to his attention, and work for his co-operation in advancing the future of the hot-air furnace. He can do not a little to increase the sales of furnaces, and would advocate hot-air heating did he know its advantages in many cases over any other system in use.

(*To be continued.*)

Pennsylvania Pie.

BY L. M. W.

This is the time of year when the stove salesman is eager to visit his Pennsylvania trade in the country districts. It is possible that the reason may be found in the statement by an official of a large foundry that he once sat down to the table at a hostelry where nine kinds of pie were arranged invitingly at the guest's disposal. A very popular custom prevails of passing the pie so that each one cuts to his own measure, and the quality permits of no fears regarding digestion. The supply seems unlimited and the variety is maintained to the end. "Pie-us" jokes about "pie-eat-he" are very heavy compared with those pies and are only perpetrated by newcomers who never before reveled in unlimited pie. Disturbance of any character is never created by these pies unless some New York or Chicago salesman happens to remark in the hearing of a Pennsylvania stove distributing tourist that those pies were baked in one of their make of stoves; then "im-pie eat-he" is apt to melt the sugar on the crust.

Brand Stove Company.

We are indebted to the Brand Stove Company of Milwaukee, Wis., for a copy of a very neatly arranged and attractively bound illustrated catalogue and price-list of their leading specialties. In its general make up it conforms to the style which has become popular with the trade, and is a credit not only to the company issuing it, but also to those who are responsible for its mechanical execution. The edges of the pages are finished in a light shade of red, while the covers are stiff board, embellished with a side title in old gold. In their announcement to the trade the company state that as the steadily increasing volume of sales renders necessary the greatest possible simplicity in the designation of their enlarged assortment of manufactures, they have determined to eliminate the term "Brilliant," formerly employed as a collective name for their heaters in distinction from the name "Famous," as signifying their line of cook stoves and ranges. From this time forward their entire product, embracing cook stoves, ranges, heaters, furnaces, gas and oil cooking ranges, &c., will be known under the single term "Famous," and this general designation will be prefixed to the individual name of each stove. The goods shown cover a wide range, and embrace constructions well known to the trade and embodying features which render them satisfactory in operation. The opening pages are given up to ranges, which are known under such names as Famous Edison, Famous Goldbrand, Famous Model, Famous Crescent, Famous Chief and Famous Gold Dust, the latter being intended for burning wood only. The cook stoves include the Famous Crescent, the Famous Chief, the Famous Puck, the Famous Brand, the Famous Gold Dust, the Famous Columbian and the Famous Pickwick. A line of hotel cook stoves is offered under the name Famous Grand, this being a new construction intended for burning wood as a fuel. The heaters occupy the closing pages of the catalogue, and are creditably represented by the Famous Aurora in the place of honor. This is a first-class heater, of rich ornamentation, and is intended for burning hard coal only. It is shown in the catalogue with and without oven attachment. The Famous Art for 1893, another square parlor heater; the Famous Brand Brilliant, a first-class medium-priced heater which has been improved for this season's trade; the Famous Star, a three flue surface burner remodeled for 1893; the Famous Oak, a new heater for soft coal or wood, made in several sizes; the Famous Jewel, a low-priced all cast cottage parlor stove, for wood or coal; and the Famous Sun, a medium-priced construction of the same class, together with a varied selection of cylinder, box and laundry stoves, make up the assortment. Attention is also invited to the line of Famous gas stoves, which have been improved for 1893. A list of hollow ware and a comprehensive index are features of the closing pages of the catalogue.

Furnace Heating and Electric Fans.

The furnaceman will be interested in the following letter from Oscar Weiderhold, with L. J. Wing & Co., 126 Liberty street, New York, giving experience with the use of disk fans and electric motors in connection with hot-air furnaces:

The past winter, which was a very severe one, proved that the heating apparatus was deficient in many buildings, such as schools, churches, apartment houses and large residences. As in most of such buildings the heat passes through flues to the different rooms, a disk fan can be placed at or near the furnace or source of heat supply and the heating capacity doubled. It is a well known fact that when the wind pressure is opposite to that side of the room where the furnace flue is situated, the current of warm air is actually prevented from entering the room. By the use of the fan this is obviated, as the fan forces the air through the flues to the different apartments or rooms to be heated. The cold air is taken from the outside of buildings and passed over the furnace or among steam pipes, as the case may be, thus ventilating as well as heating the rooms.

In the summer when the heat is not required this system can be used to great advantage for ventilating, without any alteration whatever, public schools and churches, by forced currents. It is a noticeable fact that people are often seen in public assemblies yawning and giving other evidences of being tired and sleepy, which is mostly due to improper ventilation. As electricity is in such wide use, electric motors can be and are employed as the medium of power to drive fans. They require very little power. An 18-inch fan moving 3000 cubic feet of air per minute will take only ⅛ horse-power. As these fans need only to be set in motion when the rooms are occupied, such as churches and public schools, it will be a very economical system to what it would cost to double the heating apparatus, and considering the many advantages this system has, it will soon be appreciated for the healthful air which it provides. When more information makes heating and ventilating by this system better known, its advantages will be appreciated and its use increase.

Cribben, Sexton & Co.

"Universal Stoves and Ranges" is the title of a volume of nearly 160 pages which reaches us from Cribben, Sexton & Co. of Chicago, Ill. It is in the nature of a descriptive catalogue and price-list of the goods named, and presents in connection therewith a great deal of information which is interesting and valuable to dealers handling high-grade stoves. The opening pages are devoted to a bird's-eye view of the company's works, the front elevation of their office and salesroom in Chicago, and general views of their agencies in San Francisco, Cal., and Portland, Ore. The company state that they have made arrangements with the Harper & Reynolds Company, in Los Angeles, Cal., to supply the trade in that section, and for the accommodation of the trade tributary to Salt Lake City a large stock of Universal stoves and ranges will be carried by Charles Wanless & Co., Salt Lake City, Utah. Nearly 60 pages of the catalogue are given up to ranges of attractive dress and modern construction made under such names as Regal Universal, Peerless Universal, Welcome Universal, Superb Universal, Novel Universal, Famous Universal, Apollo Universal and Prize, all being intended for burning coal or wood, and the Pacific Universal, Mystic Universal and the Victor Universal for burning wood only. The cook stoves occupy something over 30 pages of the catalogue, and are offered in sufficient variety to meet all reasonable requirements of the trade. These are also made under the generic name Universal, with such prefixes as Sterling, Family, Prize, Majestic, Premium and Elegant. The heaters occupy the latter half of the volume and are represented by the Radiant Universal in the place of honor. This is a new high-grade heater for hard coal, and embodies among other features extra heavy fire pot, large bailed ash pan, patent automatic swing covers, permanent hot-water attachment, reflector top section, double heating attachment and nickel trimmings. The manufacturers refer to this stove as "the most elaborate production of the age and an embodiment of all details known to modern stove manufacturing science." The Jewel Universal is a richly treated surface burner and is said to include in its construction many specialties not found in other stoves of its class. A varied assortment of cottage parlor, sheet-iron cylinder, globe, cannon, laundry, oak, Todd and box stoves are presented, together with price-lists of hollow ware and miscellaneous goods. Sectional cuts of stoves, with the various parts numbered, are shown in connection with explanatory tables for the purpose of facilitating ordering repairs. The catalogue closes with a general and alphabetical index.

R. Robinson & Sons

of Chicago have brought out a neat catalogue of the leading goods which they handle. The 114 pages of the volume are printed in red and black, upon good paper, and are bound in colored paper covers, with side and back titles in red and old gold. The goods shown cover an extensive assortment, prominent among which are those made under the name Red Cross and turned out by the Co-operative Foundry Company of Rochester, N. Y. In addition to these, we find the Model steel range, made by the Portsmouth Stove & Range Company; the Superior Process vapor stoves, which have been improved for the season of 1893, and which are offered by Messrs. Robinson & Sons in several styles and sizes. The Novelty oil heater, with brass tank and roller base, and the Splendid, another oil heater of attractive proportions; the Bermuda hot-water heater, made in three sizes; the Hornet hot-air furnace, together with a general and alphabetical index, constitute features of the closing pages of the catalogue.

Scanlan & Co.

of Louisville, Ky., favor us with a very neat catalogue of the stoves, ranges and hollow ware they manufacture. The printing is in two colors, the edges of the pages are finished in bright red, while the binding is in flexible covers of black cloth carrying a side title in old gold. The make up is very neat and the volume is likely to be appreciated by the trade. The company state that the designs and patents illustrated and described in the catalogue are properly protected by law and that they will prosecute to the fullest extent any infringement of their rights. After a special notice to the trade relative to the company's assortment of hard wood mantels and cabinets, slate and iron mantels, &c., directions are given for operating stoves, following which the Faultless line of ranges is illustrated and described. This construction is intended for burning coal or wood and is made in four sizes. Under the same name the company offer a line of cook stoves of pleasing design and made in three sizes. The Faultless Nellie Bly, a four-hole cook stove constructed on the most improved principles; the Faultless New Woodlawn, a four-hole range for burning wood only; the Faultless New Daisy, four-hole wood cook; the Faultless Glendale, another member of this general class, and the Faultless South, a six-hole step stove for burning wood, are also considered. The heaters are represented by the Faultless Star, a very neat oak stove which the company have added to their assortment this season. This heater has double feed doors, draft slide, swing top and heavy cold-rolled steel body. The Faultless Relief, a sheet-iron cylinder stove, made in several sizes; the Faultless Spray, a cheap cannon stove; the Faultless Florence, an attractive Franklin; the Faultless Magpie, a neat box stove, and the Faultless Laundry, are some of the other goods to which the attention of the dealer is directed. The closing pages are given up to the presentation of hollow ware, stove boards, grates, iron mantels, &c.

Rock Island Stove Company.

We are indebted to the Rock Island Stove Company, Rock Island, Ill., for a copy of the catalogue which they have issued for the season of 1893, covering their leading specialties. The goods are made under the generic name Riverside, and are offered in a variety of styles and sizes. The opening pages are given up to the Riverside range, a six hole stove intended for burning hard coal or wood. The ornamentation is neat and effective, the castings strong and durable and the improvements of the latest type. Following this we find the Home Riverside, especially adapted to using the fuels of the Northwest and to meet the requirements of small families. The Ideal Riverside is another member of this general class, and is offered in three sizes. The Rock Riverside is a new medium-priced four hole range of tasteful decoration, and has rounding front and grate, patent take-out damper, sectional linings and fire box, automatic oven-door catch, corrugated oven bottom and cut top. The Home Riverside is a neat four-hole cook stove for burning soft coal or wood and is offered with all the latest features. Other cook stoves include the Ideal Riverside and the Rock Riverside, the latter being an entirely new four-hole stove for soft coal or wood. Under the name Wood Riverside the company offer a line of four and five hole ranges, which are new this season. Among the heaters we notice the Maple Riverside, a new cottage parlor stove for burning wood; the Riverside Oak, shown with and without ventiduct; and the Island City, a heavy cannon stove made in three sizes. A feature of the closing pages of the catalogue is a repair list, giving the prices of pieces usually called for. There is also given a list of pieces fitting more than one stove and a list of interchangeable wood linings, together with directions for setting up and operating stoves.

Bloomington Stove Company

of Bloomington, Ill., have just issued from the press an illustrated catalogue and price-list, in which the trade is likely to be interested, from which the company have omitted nearly all of the older patterns, although they can be furnished, together with repairs, when so desired. During the past year extensive improvements have been made in the company's line of goods, special attention being invited to the Grand Central and Central stoves and ranges. These goods are of exceedingly attractive design, and are made with those features which are essential to satisfactory operation. The Grand Central range has a large fire box, durable linings, automatic drop grate, large ash pan, draw hearth, polished steel finished edges and nickel trimmings. It is made in a variety of styles and sizes, several of which are shown in the catalogue. The Central range is a four-hole construction, moderate in price and satisfactory in operation. Under the names given above the company offer extra heavy first-class cook stoves, which have the modern improvements. Among the heaters we find the Royal Crown, hard coal base burner, made in three

sizes; the Perfect Carbon, a soft coal base burner of attractive ornamentation; the Perfect Oak, adapted for burning soft coal or wood; the Carbon, a heavy cannon stove; the Modoc, a neat Todd, and a tailor and laundry heater made in one size only. A price-list of sundries completes the catalogue.

The Leaf Stove Company.

Amid the cupids and flowers embossed on the dark-green covers of a catalogue sewed with red-silk cord appears, in silver-bronze lettering, the inscription, "The Leaf Stove Company, Phillipsburg, N. J., Manufacturers of Stoves and Ranges," while the trade-mark, consisting of a maple leaf, adorns the back cover. The announcement states: "Since we have assumed control of the Phillipsburg Stove Works, we have thoroughly reorganized and rehabilitated the plant and shall in future direct our energies toward the production of first-class goods only." This is followed by a brief statement of their intentions for the future and the terms. The Maple Leaf is a handsome range, shown by a half-tone engraving, having as prominent characteristics large sheet flues, correctly proportioned fire-box, a perfect-working duplex grate, large ash pit and a four-piece top with braced cross pieces, cut reversible long center and ribbed covers, as enumerated in the text, which states that every range is supplied with an effective device for heating an upper room without additional cost. The Holly Leaf, a new five-hole range of modern design, and the Friendship and Miner's Rescue are substantial low-hearth cooks. The Ivy Leaf leads the square parlor heaters, followed by the Paxinosa and Milo, which present the embellishment and essentials that are required by the live dealer. The J. I. C. is a globe stove, made as a single and double heater, while the Gossip is one of the smaller and popular cast-iron egg heating stoves.

ODD PLATES.

From W. B. Wilkinson, manager of the New York office of the Howard Furnace Company, Syracuse, N. Y., we receive copies of the new catalogue and other pamphlets recently issued by the company and noticed in our columns.

From Wood, Bishop & Co., Bangor, Maine, comes a pamphlet of the Monitor and Climax wood furnaces, with a letter referring to testimonials from churches that are satisfactorily heated. The letter explains that their system of placing an air grate directly over the furnace has been used in each case. The quantity of fuel consumed is an interesting feature of these testimonials to prospective buyers.

Moorwood, Sons & Co., iron founders, of Sheffield, England, have just supplied a wrought iron cooking apparatus for one of the new Atlantic liners, which is said to be a very clever piece of workmanship. The flues are all self-contained in the range, which is capable of cooking dinners for between 600 and 700 persons at one time. This firm supplied the cooking ranges for the unfortunate war vessel "Victoria."

James Campbell, formerly with the Chicago house of the Simonds Mfg. Company of New York, is at the present time disengaged and enjoying a well-earned vacation. He makes his headquarters with his brother, Robert Campbell, at 305 Pearl street, which is the New York agency of the Abram Cox Stove Company, Philadelphia.

Mehaffie & Smith, Logansport, Ind., are preparing for the fall trade by issuing a circular of the Smith patent heater and fuel economizer. The latter is a drum for attaching to a stove, and is arranged to take the air from the floor, heat it and then discharge it either into the same room or one on the floor above by means of a pipe and register.

A. Froelich, 289 Pearl street, New York, is distributing among the stove repair trade a valuable memorandum book with leaves of prepared slate and a pencil. Silver bronze on the covers show resting on an easel a sign with the words "Stove Repair Notes," and on the back is the address and a notice that he manufactures repairs for stoves, ranges and furnaces and does job casting and nickel plating.

In a recent issue of the *State*, published at Richmond, Va., a brief review is presented of the leading concerns engaged in commercial and industrial pursuits in that city. Among the number is the Richmond Stove Company, who are referred to as being the largest and oldest stove foundry in the South. They were organized over 20 years ago and possess a well-equipped plant, covering more than half a block. Nearly 100 hands are employed and several salesmen are kept constantly on the road in the interests of the company. The business of the concern has grown to such proportions that they have recently been compelled to add to their already extensive plant a three-story brick building, 46 x 80 feet in size. This is intended for office and warehouse purposes and will be fitted up in keeping with the rest of their plant. The business of the company is under the direct supervision of W. J. Anderson, the president, and R. G. Reynolds, the secretary and treasurer.

Charles E. Clark, of 231–247 Newberry avenue, Chicago, has issued his annual catalogue covering the line of goods handled. It is a volume of something over 100 pages, bound in colored paper covers, and the goods shown include leading specialties of many of the principal stove manufacturers of the country, more particularly those of Eastern foundries. Prominent among the stoves we notice the Radiant Home range and parlor heater, the Wren, New Jacket and Palos, 5-hole ranges; the Niagara, Model Garnet, Crown Bay State and Art Bay State ranges; Born's steel plate French range; the Royal steel range; the India, round base burner; the Hub, oval parlor heater; the Crown Hub, square hard coal base heater; the True American; the Magic Columbia; the Garnet parlor, and many others. The fourth page of the cover is devoted to a general view of the office and warehouse of Mr. Clark.

We are indebted to the Kernan Furnace Company of Utica, N. Y., and Chicago, Ill., for copies of pamphlets of pocket size relating to their leading lines of furnaces. The printing is neatly executed in two colors, while the binding in paper is tasteful and appropriate. Attention is invited to the Kernan, made in four sizes, portable form and for brick work; the Kernan Union in five sizes, and the Cauldron Furnace. These goods are carefully illustrated and described, while more than half of one of the pamphlets is taken up with the names of some of those who have used the heaters made by the company. A second pamphlet tells all about the merits of the Kernan smoke consumer, which is made in four sizes and intended for soft coal, while a third volume contains among other things a telegraphic code and numbers designating all parts used in the construction of the Kernan furnaces.

Fuller & Warren Warming & Ventilating Company, 43 Milk street, Boston, Mass., issue a circular addressed to the users of the Fuller & Warren cremating closets and the other customers of the company, in which they recite the particulars concerning the suits between themselves and the Smead Warming & Ventilating Company. The statement of the Fuller & Warren Warming & Ventilating Company respecting the protection of their customers will be read with interest.

The March-Brownback Stove Company of Pottstown, Pa., are distributing circulars calling attention to some of their leading goods. Among these we notice the Golden Crown, a new revertible flue parlor stove which may be used as a single or double heater; the Welcome Globe range, a new six-hole construction for burning hard coal, soft coal or wood, and the Crown furnace, which is made in four sizes, with fire pots measuring respectively 18, 20, 22 and 24 inches in diameter.

The Perry Stove Company of Albany, N. Y., have issued some illustrated circulars relating to the World's Argand ranges and heaters. The range is illustrated in general view and sectional cut, the latter showing in detail the features incorporated in the stove, and indicating the manner in which the grate may be easily removed. The merits of the stove are set forth at considerable length, and in a way to interest the dealer. The circular relating to the World's Argand base burner shows the construction, in general and sectional views, while setting forth the reasons why the heater is a success. The improvements which have been incorporated in the stove for this year are principally in the nickel section above the combustion chamber, which is enlarged and changed in form and ornamentation.

We have received from the Warren Hardware Company of Warren, Ohio, an interesting pamphlet relating to the Warren steel range, which is constructed of cold-rolled steel and offered at a low price. The oven plates of the range are of wrought steel, held in place by surrounding wrought-steel construction, thus reducing the liability to warp or fracture from unequal expansion to a minimum. The oven bottom is well braced and bolted, and the oven is ventilated in a way to produce desirable results in operation. The flues are asbestos lined, which prevents the heat from radiating into the room and retaining it where it is most needed. The top warming closet is made with sliding doors, which may be partially or wholly opened, thus preventing the escape of more heat from the warming closet than necessary while placing food within. The Warren range is illustrated in several of its varieties, while tables show the size of ovens, top cooking surface, the prices of the range complete, and also of water fronts and high closets.

The Channon Emery Stove Company of Quincy, Ill., are distributing a four-page folder illustrating and describing their Cheerful Oak heater, which has been brought out this season. The stove is carefully mounted,

has large feed doors, spark arrester, low ash pit, draw center grate for coal and half solid grate for wood, and is ornamented with nickel trimmings and spun-brass urn with jewel. The stove is made either round or square base and is intended for burning coal or wood.

THE TROY NICKEL WORKS of Troy, N. Y., have been mailing postal cards to their friends in the trade bearing the following inscription: "It is really tiresome to hear this one and that one saying 'How hard are the times.' We do not feel the effect. The banks in Troy will let us have all the money we want, and it would be well for you to remember that the Alaska is always cold. Yours with Cleveland's object lesson, Troy Nickel Works."

THE FOLLOWING have recently been passengers on the Jewel Tally-ho coach, which, as our readers will remember, is run by the Detroit Stove Works between their Chicago office and the World's Fair grounds: Mr. and Mrs. A. Ehrlich, M. Kaufmann, J. La Fevre and lady, Mrs. F. H. Fogarty and party, R. Freytag and wife, Mr. and Mrs. Chas. Daloke and Mrs. Dunkelberg, Chicago; Mrs. L. Senger, New York, N. Y.; O. L. Frazier, Davis City, Iowa; W. H. Klauer, F. Heer, Jr., and F. G. Becker, Dubuque, Iowa; J. Kramer and Miss Lizzie Etyler, Dayton, Ohio; Mr. and Mrs. Kuist, children and friends, Highland Park, Ill; Mr. and Mrs. C. N. Stevens and Miss Blanche Gibbons, Gainsville, Texas; Mrs. J. F. Schall, Batavia, Ill.; E. Bouquet, St. Paul, Minn.; Miss Helen A. Swartout and Miss Caroline H. Swartout, Owego, N. Y.; Miss Mary D Spaulding, Brooklyn, N. Y.; Mrs. W. J. Prisch, Aurelia, Iowa; H. F. Taylor, Miss Louise F. Dodge and Miss Florence H. Pomeroy, Adrian, Mich.; Mr. and Mrs. L. Rosenberg and son, Mrs. A. Felsenthal, South Chicago; Mr. and Mrs. W. F. Lane, Shumway, Ill.; Mrs. H. C. Ambler, Mrs. Page, Mr. Munson, Martin Hemingway and lady, Mrs. John Cohn and Max Wolff, all of Chicago; Mr. and Mrs. J. M. McFarlane, Detroit; B. E. Stoddard and Chris. Rensch, Madison, So. Dak.; Mr. and Mrs. M. J. Williams, Baton Rouge, La.; Mr. and Mrs. E. P. Hainski, Newark, N. J.; Miss Mollie Kornblum, Pittsburgh, Pa.; Miss Jane Morrow, Miss Alice Morrow, Miss Rose Ucker, and Miss Ida Peedles, all of Circleville, Ohio; J. McMullen and son, Circleville, Ohio; John R. Fenn, Hartford, Conn.

THE THATCHER FURNACE COMPANY, 33 Peck slip, New York City, have met with such a demand for their furnaces and single-oven ranges that they have concluded to put on the market a new double-oven range of attractive design, and embodying the latest improvements. The company are enjoying a good trade, the demand emanating from all sections.

IT IS A CURIOUS THING, looking remarkably like a "ginger snap," so popular among children, even those of a larger growth. Turning it over, however, it is seen to be made of paper and bears on it the printed legend, "With lots of 'snap' and plenty of 'ginger' in our methods we make the very best goods of the kind that money and ingenuity can produce." Then follows the Garland trade-mark. It is a very neat advertising device now being distributed by the Michigan Stove Company.

A. G. MOORE & CO., 47 Court street, Boston, Mass., will shortly put on the market a new and improved petty ledger, especially adapted for stove dealers, which will include all the points of their Boston ledger together with some new ideas, which, the manufacturers claim, will make it indispensable for small accounts.

SCRAP.

A RICH FIND of tin is reported from the Wheal Bassett district in Cornwall, England. The lode is valued at over $250 per fathom, and promises to yield valuable returns. A Plymouth, England, paper appeals to London brokers to interest their clients in Cornish mines, asserting that large tracts of unexplored mineral ground still exist in Cornwall, in which further rich deposits are likely to be discovered.

PRESS REPORTS state that the sheet steel works and tin-plate department of Wallace, Banfield & Co., Irondale, Ohio (near Wellsburg), have closed down for an indefinite period. Later reports state that the temporary closing of the works is only a precautionary measure. Nothing definite is stated concerning the future action of the company. Trade developments are awaited before operations will be pushed with the vigor of the past. In the meantime operations may be partially continued.

THE RETURNS of domestic tin-plate production for the present year are still held by the Treasury Department. The Washington correspondent of the New York *Journal of Commerce and Commercial Bulletin* says that the subject has been one to which Assistant-Secretary Hamlin has given a great deal of study, and it is hoped that something decisive in the question as to what constitutes American tin plates may be announced before long. The writer adds that the probability is that the decision will exclude from the class of American tin-plate production black plates imported into the country and dipped here. Colonel Ayer has, it is said, submitted his returns in a revised form, based upon a possible ruling excluding imported black plates.

IT IS A HEALTHY SIGN that in the present condition of financial storm and stress the American tin-plate manufacturers are holding their own so satisfactorily. While mills and factories are closing and industrial concerns have been failing right and left, we hear of but one tin-plate works which has as yet gone to the wall. This speaks volumes for the stability of the industry and the soundness of the men who have embarked in it.

MERRY & CLARK, successors to John Merry & Co., report that they are prepared to offer to the trade two brands of American-made roofing plates, manufactured specially for their house, namely, Lion, a high grade terne claimed as equal to Worcester, and Phœnix, a terne which they sell in competition with Alloway grade. These plates are made IC, 14 x 20 and 20 x 28.

A NUMBER of Welsh tin-plate works have closed down owing to the difficulty of obtaining coal, following on the strike of the miners.

The New England vessel owners are reported to be contemplating the laying up of coal vessels aggregating from 200,000 to 250,000 tons of coal-carrying capacity, in order to regulate coastwise freight rates on coal, so that a dividend may be earned, which, from the low rates ruling for the past four weeks, has been an impossibility. This action will materially reduce the amount of tonnage from which Baltimore, Philadelphia and Newport News shippers have been accustomed to draw.

The Sellers Gun Furnace.—A Washington despatch of August 10 reports that the parts of the new furnace for assembling heavy ordnance have reached the Washington gun shops from Philadelphia, and will soon be placed in position. The furnace is the invention of William Sellers, the machinery builder, and is intended to prevent the sticking of tube and jacket of great guns while in process of assembling. The naval ordnance officers are awaiting the results of the proposed system with great interest, as it is destined to change the method of assembling. Instead of the jacket being expanded in a pit and then placed over the tube, the tube is inserted in the furnace in a horizontal position, and while the intense heat is applied the tube is forced to its seat. A device is affixed to the tube so that a stream of cold water is applied to the tube as it is being shoved into the jacket. By this system the jacket is not free from the heat of expansion until the tube has been correctly inserted and the possibility of the jacket contracting upon the tube is therefore lessened. The first gun to be assembled by the Sellers furnace will be the nickel-steel gun, the parts of which are ready at the Washingon ordnance shops. This is the first nickel-steel weapon, and is intended as an experimental gun to be used at the Indian Head proving ground in testing powder. The gun is of 8-inch calibre. It will be assembled as soon as the pyrometers, used for measuring the temperature in the furnace, are received.

A new naphtha launch, the "Queen Anne," excites some interest in engineering circles in Chicago. The explosion in the naphtha vapor which furnishes the power is caused by introducing an electric spark. The "Queen Anne" and her engine were designed and built by Thomas Kane of Racine, Wis., and brought to Chicago for trial. The naphtha is changed into vapor in the front part of the boat, and is conducted to the cylinders of the engine. The electricity is furnished by a six-cell battery under the floor, and the wires lead to the two cylinders. The chief merit of this engine over steam for a small boat is that it does away with heat, the boiler and fire box of the ordinary launch being done away with. The engine is easy to handle, and the boat does not require a licensed engineer and pilot. The machinery develops about 10 net horse-power, and will run the launch about 10 miles an hour. The propeller wheel is 32 inches in diameter. The boat itself is 33 feet long and 8 feet beam, and draws 32 inches. During the run from Racine to Chicago the engine behaved well, and Mr. Kane is confident that it will revolutionize the motive power of small boats.

The Mississippi Valley Lumber Association meeting last week in Minneapolis in semi annual session agreed to reduce the cut for the rest of the season one-half. The sawmills will be closed on September 20.

TRADE REPORT.

The Iron Market.

Eager watchers of the Iron markets note in some instances the first symptoms of a better feeling. It is probably natural that even the slightest evidence of a turn is given attention beyond its real significance. But affairs have been in so wretched a condition and bad news has been so overwhelming that any offset against them is hailed with delight.

Chicago is beginning to cultivate a hopeful view, largely based on the promise of a greater attendance at the fair. There has been some local buying of Pig Iron, and the expected purchases of Bars by those who follow the leadership of the largest consumers are beginning to be noticed.

It is reasonable to look to the markets east of the Allegheny Mountains for the first signs, because it is in that territory that relatively there is the greatest production among the rolling mills and steels works. In the West so many are still idle, undergoing repairs or awaiting settlement of wages questions, that what work originates in neutral territory goes to the Eastern mills. The first step in the direction of an improvement must come in the shape of a larger volume of business. Since occasional transactions of magnitude are cropping up, the inference is drawn that the very worst is over. There will, however, have to be quite a prolonged period of activity, involving heavy sales of materials, before there is any prospect whatever of better prices.

Pig Iron.—The volume of current business in the New York market is very light, and the market continues weak. We quote Northern brands $14 @ $15 for No. 1; $13.25 @ $14.50 for No. 2, at tidewater. Southern Iron, same delivery, $13.75 @ $14.50 for No. 1; $12.25 @ $13.25 for No. 2; $12 @ $12.25 for No. 3; $12 @ $12.25 for No. 2 Soft, and $12.50 @ $13 for No. 1 Soft.

Our Philadelphia correspondent reports the movement of Pig Iron in that district as unusually light, although, in view of the general surroundings, it is perhaps as large as could be expected. Furnaces are not accumulating stock to any extent, neither are they making many new sales, deliveries being chiefly to fill former engagements. Inquiries are being made for additional quantities, but they have not resulted in much business, as neither side is particularly anxious to enter into new engagements. Ultimately, it is believed that prices will make a sharp advance, as the curtailment in supply is bound to result in scarcity sooner or later. Meanwhile sales continue to be made at about last week's figures, which are usually as follows for Philadelphia and equivalent points, with spot cash transactions at 25¢ @ 50¢ less, according to circumstances :

American Scotch, No. 1X...	$16.00	@	...
American Scotch, No. 2X...	15.00	@	....
Standard Penna. (Lake Ore), No. 1x.....	14.75	@	$15.25
Standard Penna. (Lake Ore), No. 2x.....	14.00	@	14.50

There is practically no market for Pig Iron in Pittsburgh, except for a few small sales occasionally to meet immediate requirements of buyers. Not since the long Coke strike of two years ago or more has the production of Pig Iron in that district been so low as it is at the present time. Foundry Irons are dull and neglected, due to the curtailment of operations among the foundries. Quotations are given as follows :

No. 1 Foundry	13 00	@	13.25	cash.
No. 2 Foundry	12.00	@	12.25	"
Charcoal Foundry No. 1	15.00	@	16 00	"
Charcoal Foundry No. 2	14.00	@	15.00	"

Agricultural implement makers are the only consumers now buying Pig Iron to any extent in the Chicago market. General foundrymen are buying sparingly, but inquiries are being made which may lead to business soon. The usual carload trade has been interfered with by sales at very low prices of stocks held by bankrupt foundries. These stocks were not large and are now well out of the way. The Malleable Iron Work Syndicate are understood to be feeling the market on Lake Superior Charcoal and are likely to purchase heavily when they decide to close. Quotations are as follows, subject to concessions for prompt cash and immediate shipment :

Lake Superior Charcoal.....	$16.00	@	$16.25
Local Coke Foundry, No. 1...	13.50	@	14.00
Local Coke Foundry, No. 2...	12.75	@	13.00

Hocking Valley, No. 1	15 25	@	15.50
Jackson County Silvery.....	16.50	@	17.00

The Southern Pig Iron market grows worse, if possible. There have, however, been some sales of No. 2 Foundry for delivery monthly during the remainder of this year at $8.50 ℔ ton, f.o.b. Birmingham, but not to any large extent, and while furnaces are indifferent about selling at this price, there are few buyers. This Iron has been sold for spot cash at 25¢ ℔ ton less, but while any price might be accepted by a needy furnace for cash in hand, there appears to be less urgency to sell, probably because there is less Iron being made, but there is an ample supply for the greatly reduced demand. Quotations are generally as follows :

Foundry.

Southern Coke, No. 1.	$12.75	@	$13.00
Southern Coke, No. 2.....	11.25	@	11.50
Southern Coke No. 3.....	10.75	@	11.00
Ohio Soft Stone Coal, No. 1....	15.50	@	16.00

Metal Market.

Pig Tin.—Prices for Pig Tin have dropped about ¼¢ ℔ pound under the weight of combination of unfavorable circumstances, not the least among which is pressure by the "bear" interest, which, apparently, misses no opportunity to take advantage of every circumstance that may be turned to its account. New speculative deals have been few in number and invariably on a small scale. Purchases for trade and consumptive account seem also to have been below the average, although sufficient to make quite an impression upon spot supplies. On late dealings the price for spot stock dropped to 18.20¢. August delivery went quite as low and September was offered at 18.35¢. Cables to the Metal Exchange noted that Straits shipments during the first half of August were 1000 tons to Great Britain and 800 tons to the Continent, against a total of 2025 tons during the corresponding period last year.

Copper.—The demand from consumers drags slowly, and is considerably below the average for this season. Such demand as exists is almost altogether for small quantities. Contraction of work at various large brass manufacturing establishments and in other lines of industry in which Copper is more or less extensively consumed (the outcome of general trade depression) has effectually offset the best efforts of producers to maintain prices by restricting the output. In other words, the demand has fallen off quite as much or more than the supply. Hence, any effort to expedite business leads to weakness in prices, and, while not numerous, such efforts have been sufficient to keep the

market weak and unsettled. Lake Superior Ingot is, at present, freely offered at 9¾¢. Other varieties are relatively as low, say about 9½¢ for Electrolytic and 9¼¢ for common casting stock.

Sheet Copper.—No change has taken place in the market for this material. The demand continues limited, comparing unfavorably with the usual business done at this season. Prices are unchanged.

Pig Lead.—There has been only a very moderate business during the past week. The demand continues sluggish, the result of restricted consumption and a general disinclination to lay in any stock. Such business as was effected went at about 3.30¢, indicating a fair undertone of steadiness, despite the trying conditions of unusually dull trade.

Spelter.—There has been a drop in price to 3.80¢ @ 3.85¢ for standard Western brands, delivered here or at common point. Comparatively little business is being done in this metal. Narrow consumption and monetary conditions are the guides of price, which depends entirely upon magnitude of orders, prompt payment, &c.: For small lots 4¾¢ @ 5¢ for Western is quoted, but these prices might be shaded on desirable orders.

Tin Plates.—Dullness is still the conspicuous feature of the market. There are hardly any inquiries for futures and spot stock, except in small quantities, is not wanted. Prices are unsettled and irregular, with a decided bearing in buyers' favor, particularly in case of ordinary Cokes. Concessions of 2½¢ @ 5¢ from the popular figures are not infrequent for spot cash. The packing business, except among some of the stronger concerns, is almost at a standstill for lack of accommodations wherewith to pay for material, consequently the usual demand for Coke Plates at this season is much curtailed. In all lines, however, stocks are believed to be very light throughout the country, and a reviving demand of a large character is by many anticipated in the fall. A moderate demand exists for domestic Roofing Plates, but stocks of these are being piled up at some of the works to a greater extent than heretofore, indicating some falling off in the consumption, as the importation of Terne Plates has dwindled considerably at the same time. British advices of August 16 report somewhat better inquiry from America for Tin Plates, chiefly oil sizes, on which very close prices can be obtained.

Sheet Iron.—No improvement is to be recorded in the demand for Black Sheets. With cash in hand buyers could probably name their own prices. Large consumers, who usually buy ahead are this year purchasing from time to time to fill their immediate requirements. Galvanized Iron makes a rather brighter showing. A moderate demand exists for this material, of a "little and often" character, keeping the trade going in a satisfactory manner. Makers are, it is said, talking of advancing the price on Galvanized Sheets, stocks being low and an augmented demand looked for in the coming months.

Chicago Report.

Scrap.—Buying prices are now as follows:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$8.00	....
Machinery Cast	6.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	4.00	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	6.00	....
No. 2, such as Shovels, Hoes, &c.	4.50	....
Old Boilers—whole (Iron)	6.00	....
" (Iron)—cut in single Sheets and Rings	9.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.50	....
Turnings	5.00	....
Horseshoes	9.00	....

Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

THE ELMIRA STAMPING & PAPER MFG. COMPANY, Elmira, N. Y., make a specialty of Jute, Rag, Rope and Manila Papers, which they sell direct to the manufacturers of Tinware, Wire Goods, Hardware, Enameled Ware, &c. The company refer to the quality of these papers. They are also putting on the market the Ithaca Red Rosin-Sized Sheathing Paper. The company's paper mills are located at Ithaca, N. Y.

CAVANAGH & THOMPSON, jobbers of Wooden Ware, Brushes and House-Furnishing Goods, 130 Reade street and 13 Hudson street, New York, who were burned out recently, have decided to go ahead at the same stand, and hope to be in condition to execute orders by September 1. Their loss on stock amounted to about $4000, fully insured. They have settled with the underwriters and have about closed out such stock as the fire left. A force of carpenters will be put in as soon as practicable, the interior renewed and a stock of merchandise installed, with which to resume business.

CONDITION OF THE

Hardware Trade.

THERE is little in the condition of affairs in the Hardware trade to indicate the approach of the activity which in ordinary times would be expected to begin about this season. Travelers are to a large extent at home, and manufacturers and jobbers are making slight efforts to secure trade. Prices on manufactured goods are generally low and already based on cheap raw materials. Stocks are generally small, or at least moderate, and there is but little inducement to force goods on the market at lower prices, even if this course would result in a large increase of business, while manufacturers are continuing the conservative policy which they have pursued for many months, in reducing production to conform to the conditions of the times.

Advices from Chicago.—Hardware jobbers talk more cheerfully, although they do not claim that business is much better, but there is a slight improvement which makes them feel that the worst is over. Every day also brings the time nearer at hand when preparations must be made for cold weather, and this will certainly add to the volume of business. The news from agricultural districts is encouraging and farmers are expected to be in good condition shortly from the heavy demand for food products. This will at once be reflected from the retail Hardware trade. There is some apprehension that a revival in trade may be so sudden that it will catch dealers generally very short of stock. The Heavy Hardware trade is in better shape than a short time since owing to the improved demand for iron and steel from consumers who usually buy of manufacturers direct. Collections are by no means poor.

Notes on Prices.

Cut Nails.—The demand continues small, transactions are few and the quotation of $1.05 for carload lots at mill remains unchanged, but this figure is more firmly maintained than it has been, this market feeling the influence of the improvement in Wire Nails. Small lots from store in New York are held at $1.30.

Advices from Chicago.—An improvement is noted in the demand for Cut Steel Nails. Good specifications have been received by manufacturers within the past week. It is too early yet to found much hope on the movement, which may or may not be the forerunner of a better condition of things. Prices are unchanged at $1.20 to $1.25, Chicago, for factory lots, and $1.25 to $1.30 for small lots from stock.

Wire Nails.—The makers of Wire Nails appear to have succeeded in establishing an understanding among themselves, and the quotation has been

advanced to $1.50 for carload lots at mill by all the makers. The mills remain generally closed and stocks there are very much reduced and assortments broken.

Advices from Chicago.—Buyers seem to have suddenly found that they need Wire Nails; even those who did not expect to be in the market for several weeks. Inquiries are numerous and sales have been made at advanced figures. The price for factory lots is now $1.50, Chicago, and makers say that there will soon be another rise. Factories are still shut down and stocks are badly broken. Some manufacturers have not made deliveries for two weeks on old contracts, although importuned by their customers, alleging that they have no stock to ship from. Jobbers' prices are maintained at $1.55 to $1.60, according to quantity.

Barb Wire.—Business in this line continues confined to small lots, and we continue $2.45 to $2.50 as the nominal quotation for carload lots of Four-Point Galvanized at mill, small lots from store being held at the usual advance.

Advices from Chicago.—The Ellwood Mfg. Company have issued a circular quoting Glidden Wire at $2.10, Junior Wire $2.05, Ellwood Four-Point $2.05, for carload lots of Painted, with 5 cents advance for less than carloads, and 40 cents advance for Galvanized, at their factory at DeKalb. Terms are 60 days, or 2 per cent. off for cash in ten days. These prices only hold good for stock on hand. The company further state that they will hereafter refuse to give long credits, usually known as spring terms. This is an important announcement, and introduces a reform in the Barb-Wire trade which will be appreciated by other manufacturers. The practice is to be stopped of dating bills ahead and carrying accounts for an indefinite time on the payment of interest. Manufacturers report a decided quickening in the demand, although sales thus far have been mainly in small quantities. Transactions are exclusively for cash. Carload lots of Standard Barb Wire are quoted $2.10 and $2.50 respectively for Painted and Galvanized. Small lots from stock are held at $2.20 and $2.60.

Meat Tenderer.—The Frasse Company, 19 Warren street, New York, as agents for the Lavigne & Scott Mfg. Company, New Haven, Conn., are offering the Lavigne Peerless Meat Tenderer. This article is sold to the trade at a discount of 20 per cent. from the following list:

	Each.
Japanned and bright	$1.00
Full nickeled	1.25

Spery Combination Grater and Slicer.—This article was recently described in our columns. It is put on the market by the Chicago Hardware Specialty Company, 147 and 149 Lake street, Chicago, and is sold to the trade at $2.50 per dozen and $22.50 per gross.

Preserve-Jar Holder.—This article, which is being introduced by Francis H. Loss, Jr., 33 Murray street, New York, is sold to the trade at $3 per dozen list, subject to a discount of 10 per cent.

Cordage.—Affairs in the Cordage world, which were very mixed up to last week, are now assuming a more tangible form. The National Cordage Company have a manufacturing capacity equal to about 60 per cent. of the entire output. The balance is controlled by independent operators. The receivers of the National Company recently made an agreement with John Good to restore prices to a basis that would give a difference of 4 cents per pound between the finished product and the raw material. At the time it was suggested that a meeting of the independent manufacturers be called for the purpose of ratifying this price. The meeting was held on Wednesday and Thursday of last week, but the National Cordage Company were not represented.

It was decided to form a Protective Association for the purpose of deriving a greater net revenue from the business. In the absence of a representative from the National Cordage Company, it was considered a little premature to take any action on prices. The lines were laid for a working agreement which will maintain prices and facilitate the purchase of raw material.

A decision reached at the meeting—namely, to replace machinery now in use by that manufactured by John Good—was a most important step in its bearings on the future of the industry. It was demonstrated that the new spindles will manufacture Cordage 1 cent per pound cheaper than the old. This is partially due to the fact that one new spindle will do the work of two old ones. The number of spindles to be replaced under the agreement is 2000.

The National Cordage Company have in use spindles similar to those which are to be replaced by the independent mills.

From this it will be seen that the minority interest, which is perfectly solvent, has taken steps which will give it 1 cent per pound advantage over the majority interest, which is as yet insolvent. It is current opinion that the leverage which is thus secured by independent manufacturers will be used to force the National Cordage Company into some sort of a relation which will be beneficial to all makers.

Glass.—The situation of the Window-Glass market is about the same as reported last week. Eastern prices of domestic and imported Glass conflict in some cases, resulting in lower figures being named than the National official prices. Glass for immediate consumption is selling in small quantities, and it is understood that stocks in dealers' hands are generally low. Nothing definite was done regarding wages at the meeting of the National Window Glass Company, held at Chicago last week, further than to instruct the Wage Committee to arrange for a lower scale than that of the last fire. Various manufacturers and jobbers name October 1 to December 1 as the probable dates between which factories will start up. There is nothing new in the Plate-Glass market, and quotations on all kinds of Glass remain unchanged.

Old Rubber.—The market for this material is weak. Little or no purchasing is being done, and prices can only be quoted as approximate. The following quotations represent the prices for Old Rubber delivered in New York:

Car Springs, ton lots, ℔ lb.	....	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb..	....	@	.03
Rubber shoes, less than carloads	2¼	@	.03⅛
Large Hose, ℔ ton	....	@	9.00
White Wringer Rolls, ℔ lb.	....	@	.04¼
White Syringes, ℔ lb.	....	@	.05

Old Rags, Paper, &c.—Buying is being done only in a few special lines. The market for Paper Stock is weak and dull, owing to the suspension of operations by many Paper mills. The following nominal quotations represent the outside prices, delivered in New York:

No. 1 White Rags	℔ lb	3¼ @	3½¢
No. 2 White Rags	℔ lb	..	1¾¢
Mixed Rags	℔ lb		1 ¢
Blues and 3ds	℔ lb		1 ¢
Hard Sized White Shavings	℔ lb		2½¢
No. 1 White Book Shavings	℔ lb	2 @	2½¢
No. 2 White Book Shavings	℔ lb	@	1¼¢
Light Book Shavings	℔ lb		¾¢
No. 1 Mixed Shavings	℔ lb		1¢
No. 2 Mixed Shavings	℔ lb		½¢
No. 1 Printed Books	℔ lb	1 @	1¼¢
Ordinary Mixed Books	℔ lb	½ @	¾¢
Newspapers	℔ lb		½¢
No. 1 Manila Paper	℔ lb	1 @	1⅛¢
No. 2 Manila Paper	℔ lb	¾ @	⅞¢
Bogus Paper	℔ lb	⅝ @	¾¢
Common Paper	℔ lb	¾ @	½¢
Straw Chips	℔ lb	½ @	⅝¢
Binders' Clippings	℔ lb	½ @	⅝¢
Jute Butts	℔ lb	1	1/10¢
No. 1 Jute Bagging	℔ lb		1¼¢
Mixed Bagging	℔ lb	¾ @	1 ¢
No. 2 Bagging	℔ lb	½ @	¾¢
Hemp Twine	℔ lb		2¼¢
Manila Rope	℔ lb		2½¢
Jute Rope	℔ lb	1½ @	1¾¢
Mixed Rope	℔ lb	¾ @	⅞¢

Old Metals.—The market for Old Metals continues dull. Nothing is being done in futures, and spot business is only to the extent of immediate requirements. Prices are weak, the following quotations showing those now ruling in New York:

Heavy Copper	℔ lb	8¾¢
Light and Tinned Copper	℔ lb	7¼¢
Heavy Brass	℔ lb	6¢
Light Brass	℔ lb	5¢
Lead	℔ lb	3¢
Tea Lead	℔ lb	2¾¢
Zinc	℔ lb	2¾¢
No. 1 Pewter	℔ lb	14¢
No. 2 Pewter	℔ lb	7¢
Wrought Scrap Iron	℔ gross ton,	$13.00
Heavy Cast Scrap	℔ gross ton,	9.00
Stove Plate Scrap	℔ gross ton,	6.00
Burnt Iron	℔ gross ton,	4.00

IT IS CLAIMED that the only Tube works now in full operation in the United States is that of the Syracuse Tube Company of Syracuse, N. Y.

Trade Notes.

THE NEW ERA RADIATOR is a seasonable article which is illustrated and referred to in the advertisement elsewhere of Wilmot Castle & Co., Rochester, N. Y. Any one wishing full information of this or other goods manufactured by the above firm can obtain it on application.

THE ÆTNA STANDARD IRON & STEEL COMPANY, large manufacturers of iron and steel sheets and bars, at Bridgeport, Ohio, have been compelled to make a general reduction in wages, which affects officials of the concern as well as employees. For the purpose of meeting any urgent demands on the part of their customers, and also to assort up their stocks, the Ætna-Standard Iron & Steel Company have started up three of their light sheet mills, and will, therefore, through their period of idleness be able to meet any ordinary call for supplies of stock material. The firm have not fixed any date for a general resumption of work.

REPORTS from Cincinnati, Ohio, indicate that a movement is well under way for a resumption of operations in the rolling mills of that district. During the summer shut down the Newport Iron & Steel Company have put a new foundation under their large engine. It is expected that work in their mills will be commenced very soon. This concern make a specialty of light sheets for roofing and corrugating purposes. The jobbing mill of the Licking Rolling Mill has been changed to a light sheet mill and other improvements have been made. This mill resumed work on Wednesday, July 9, and the outlook is good for steady work. The Cincinnati Rolling Mill Company, who are now proprietors of the Riverside Mill, have also changed their jobbing mill for the purpose of making light sheets exclusively, the product being used largely for galvanizing purposes. This plant is now in full operation. At Mitchell, Tranter & Co.'s mills no changes were made this summer. Operations have commenced and a steady run is anticipated. The Anchor Iron Works, formerly owned by the late Colonel Dayton, which were sold recently for the extraordinarily low sum of $38,000, are still idle and nothing can be learned concerning the future of this plant. Machine shops, boiler works and other industries allied to the Iron and Steel trade are doing a fair business.

THE NOVA SCOTIA STEEL & FORGE COMPANY, New Glasgow, Nova Scotia, are making extensive additions to their works. A Boiler-Plate mill is contemplated, and it is probable that a Sheet mill will follow. The Dominion of Canada consumes large quantities of iron and steel each year, but none are manufactured in that country. Statistics show that nearly all that is used is imported from Great Britain.

IN ALL PROBABILITY an arrangement will be consummated at an early date by which the large plant of the National Tube Works Company, at McKeesport, Pa., now idle in all departments, will be put in partial operation. W. C. Converse, general manager of the concern, was in McKeesport last week, and it is believed that, as a result of his visit, the workmen will agree to accept a temporary reduction in wages, with the understanding that with improved trade conditions the reduction will be restored. It is stated that a full appreciation of the condition of affairs exists among the workmen, and that they are ready and willing to agree to any arrangement by which operations can be resumed.

ON TUESDAY, the 8th inst., two lap-weld furnaces and two butt-weld furnaces in the plant of the American Tube & Iron Company, at Middletown, Pa., were put in operation. Future operations of the plant depend largely on the number of orders received and the general condition of trade. The present resumption is more of a cleaning up process, in order to get the stock on hand into a merchantable shape, than anything else It is probable that the works of this concern at Youngstown, Ohio, will also be put in partial operation during this week. Wages of employees at both plants have been reduced 10 per cent.

MERRY & CLARK, successors to John Merry & Co., whose new card is placed in our advertising columns, are pushing the sale of their well-known brand of imported Roofing Plates, Merry's Old Method, a heavily coated terne which they guarantee 120 pounds to the box. As was noted in a late issue, George E. Merry, son of the late founder of the firm and his associate up to the time of his death, has bought out all other interests, and in conjunction with Edw. Clark is continuing the busines of John Merry & Co. under the new title. Mr. Merry has conducted the business in the interest of the estate since his father's death.

CLINTON WIRE CLOTH COMPANY, Clinton, Mass., announce that William H. Howard has assumed charge of their New York store, having been succeeded in Chicago by Edwin F. Schmidt, for many years in the company's employ at factory and Chicago. The company also take occasion to thank their customers for their kind consideration since the destructive fire at their factory April 19 last, and state that in rebuilding they have largely increased the capacity of their plant and fitted it with the latest and most approved machinery, which will enable them to meet all demands and maintain the high quality of their goods.

CORDLEY & HAYES, 172 Duane street, New York, sole agents for the United Indurated Fiber Company of New Jersey, whose factory at Lockport, N. Y., was destroyed by fire on July 29, desire us to state that while this fire will seriously cripple them in filling orders for Pails, Tubs, Spittoons, Wash Basins, Butter Bowls and Slop Jar Mats, they are still in position to supply all orders for many of their lines, having the product of their other factories to fall back on. They are rebuilding their Lockport factory on a much larger scale than formerly, and are confident that in three months they will be again turning out goods from that point.

AT A JOINT MEETING of the stockholders and creditors of the Youngstown Stamping Company, held at Youngstown, Ohio, last week, it was decided not to take any steps looking to the taking of the business of the concern out of the hands of the receiver so long as the general depression in trade continues. For some months past the works of this concern have been operated under the management of W. C. Hine as receiver.

JAMES ECKELS has been appointed receiver of the Vienna Stamping & Enameling Company of Chicago, whose works are at Porter, Ind. The failure was precipitated by an attachment filed by the Roessler & Hosslander Chemical Company. It is reported that the liabilites are $80,000, and the assets $60,000.

LOUIS WAEFELAER, manufacturer of sanitary appliances, 54 Beekman street, New York, is distributing illustrated catalogue and price list D, which has been compiled largely for the use of architects. It calls attention to improved lavatories, noiseless syphon, washout and short-hopper closets and a line of sanitary specialties covering 46 pages $9\frac{1}{4}$ x $11\frac{1}{2}$ inches. Every illustration is accompanied by a plate number, which architects are urged to specify in ordering goods of this make. This house has been designated the sole agent for New Jersey for the sale of porcelain enameled bathtubs, made by the Standard Mfg. Company, Pittsburgh, Pa. These well-known goods are enameled by the natural-gas process, which we are informed insures a better and smoother finish, while the quality of the porcelain enamel is guaranteed to be the same regardless of the price of the tub, which may be more or less expensive in proportion to trimming or exterior finish.

THE TRADE are informed by a circular letter issued by the Steel Bath Mfg. Company, Detroit, Mich., that on account of the success of the Steel-Clad bath they have found it necessary to provide additional manufacturing facilities to supply the increasing demand. A company, therefore, has been formed for its manufacture in New York City, under the style of the Steel-Clad Bath Company of New York, 447 to 453 West Twenty-sixth street, New York, who will supply these goods for the Eastern trade, comprising the territory included in the following-named States, viz.: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Maryland and District of Columbia. Arrangements have been completed whereby the old-established company, the John Trageser Steam Copper Works, will manufacture these baths for the Steel-Clad Bath Company. The latter firm likewise address a circular to architects, builders, plumbers and jobbers of plumbing material calling attention to the excellent features of this bath and describing its construction. The selling agent of the Steel-Clad Bath Company of New York is S. Davison, 447 West Twenty-sixth street, New York.

Excelsior Paste.

In response to repeated calls for a paste suitable for attaching asbestos paper to furnace pipes and stacks, the Excelsior Steel Furnace Company, Chicago, Ill., announce that they are prepared to supply a good article for that purpose. It is furnished in solid form and is prepared for use by adding two parts water to one of paste. They claim that it will keep indefinitely and secures the paper permanently to the pipes without wire, and is not molested by mice or rats. The paste has been produced specially for this purpose, and the steady increase in demand that has followed its introduction is referred to as one of its best recommendations.

The United States protected cruiser "Minneapolis" was successfully launched at Cramps' shipyard, Philadelphia, on the afternoon of Saturday, August 12, in the presence of the Vice-President of the United States, Secretaries Herbert and Morton, and a large number of Senators and Representatives from Washington. The christening ceremony was performed by a daughter of Senator Washburn of Minneapolis.

Industrial Growth Checked.

The manner in which the dearth of money has checked all industrial progress and the rehabilitation of insolvent enterprises is being very forcibly illustrated just now in a few notable instances in Wall street. The long period of depression and attendant bankruptcy which followed the May panic left a number of properties on the shoals. Of the dozen or more mention might be made of National Cordage, Reading, Erie and Northern Pacific. Efforts have been made in a number of cases toward reorganization with only partial success.

The Reading plan was the most favorable one to shareholders, but it fell through because of the opposition of certain general mortgage bondholders. It is generally conceded as fortunate that it did, for had the underwriting syndicate been called upon to hold up the company during the period of tight money through which the country is passing, the strain would have been seriously felt in other directions. The failure of the plan to go through further weakened public confidence, and, without doubt, contributed to the period of distrust which followed.

The Richmond Terminal plan, a most drastic one in its nature, was assented to by nearly all of the multitude of security holders who came under its jurisdiction, simply because it was the only action of a saving nature which they could take. The assessments were regarded as a hardship at the time it was launched, which was during a period when money was much easier than at present. Since the scarcity became aggravated many holders have been forced to sell out; as a result one of the stocks included in the plan, and a fair criterion of the others, sold at ⅞ of $1 per share, after two cash assessments aggregating $3⅛ had been paid thereon. This demonstrates that it is next to impossible to pay the assessments.

Cordage is another concern whose rehabilitation is being delayed on account of tight money. The plan provides for an assessment of 10 per cent. on the common stock and 20 per cent. on the preferred. The first assessment on each, amounting to $5 and $10 per share, respectively, was paid on July 10. The second assessment of $5 per share on each class, due August 10, was extended until August 26, with the understanding that it should bear interest at the rate of 6 per cent. Before the first assessment was paid the common stock was selling at about $10 per share; with the assessment paid the current price is about the same figure, it having lost 5 per cent. since July 10. This affords little encouragement to shareholders, who will soon be forced to pay the second assessment. No one questions the ability of the bankers' syndicate which has the reorganization in charge to bring it to a successful conclusion. The time required, however, will, unless conditions change materially, be longer than September 10, the date on which the last assessment on the preferred stock is due.

General Electric has a floating debt of about $4,000,000. It has been making heroic efforts to fund this, and without tangible results until lately. The stock, in consequence, sold down from 115 to 31, and is now about 40. We understand that a plan will be put out in a few days to care for this floating debt. From the little known of the plan the opinion formed is that drastic measures have been resorted to to raise the money. A security company will be formed with a preferred capital of from $4,000,000 to $4,500,000, entitled to 6 per cent. interest, and a common capital stock of from $4,000,000 to $4,500,000 to be given as a bonus to the subscribers of the preferred. This issue of from $8,000,000 to $9,000,000 stock is to be made to raise $4,000,000 cash. The assets against which the stock is to be issued are the security assets in the company's treasury, which, on January 1, represented a par value of $16,220,391, and an 8 per cent. value of $9,173,251. Of these stocks some 15,000 shares of New York Edison Electric Illuminating and 5000 of Boston Edison Electric Illuminating were sold early in the spring to relieve the more pressing needs of the company. The amount of these stocks which will be used to offset the stock to be issued is not known.

Another example of the damper which is being placed on industrial enterprises is the action taken by the Manhattan directors Tuesday regarding rapid transit in New York. This company went so far, late in the spring, in their negotiations as to offer the city $100,000 per annum in addition to their regular tax for franchises, reserving the right to build to Yonkers at their discretion. The city's proposition was not greatly different, and the belief prevailed that an agreement would be reached. The communication which will be read before the Rapid Transit Commission to-day will say that in view of the financial depression the Manhattan Elevated Railway Company deem it unwise to undertake extensions such as are proposed, thus giving up the project unless the Rapid Transit Commission deem it wise to wait until times change for the better.

Other examples might be cited, but the foregoing is sufficient to show that it is next to impossible, even where the strongest backing exists, to place enterprises on their feet, much less extend those which are in existence. In the same degree it is impossible to float new concerns, and it can be said that not one of any prominence has appeared in Wall street for four months.

The Chicago, Rock Island & Pacific Railway Company announce that they have extended the "Rock Island route" to Fort Worth, Texas, and are now in a position to transport freight of all kinds to and from all points in Texas. Arrangements have been perfected for first class freight service.

Considerable activity is developing in the oil districts of Peru. English companies in the trade are reported to have acquired tank steamers for transporting the oil to China. It is believed that the whole of the western slope of the Andes, from Colombia down to the southern extremity of Chili, is rich in petroleum.

Implement manufacturers and dealers in Minneapolis and St. Paul have had a desperately dull season, except in the line of harvesting machinery. In South Dakota, on the contrary, a very large trade has been done in all lines of agricultural machinery, owing to the great influx of immigrants to that State during the present season.

Comptroller Eckels predicts that nine out of ten of the banks which have closed during the present stress will open for business again.

Grain exports from Montreal this season have far surpassed in volume the shipments of any previous year.

The Treasury Department has issued a detailed statement of receipts from internal revenue for the fiscal year ending June 30, 1893, which shows an increase in nearly every department, even greater in proportion than the growth of the country in population. The net increase of receipts from all sources was $7,145,093, or from $153,857,544 in 1892 to $161,002,637 for the past fiscal year.

News and Notes.

The Austrian Board of Trade report for the year 1892 shows the exports from that country to have been $275,691,600, and the imports $238,963,200; leaving a balance in favor of the monarchy of $36,728,400, which is little more than half that of the preceding year. The year 1892 was, however, generally one of reduced production and sale.

In view of the tariff war between Germany and Russia, which appears likely to close the markets of the former to Caucasian grain, it is interesting to find that the United States is the principal grain supplier of the Fatherland, Russia coming first in barley only. The German grain imports from the two countries during 1892 were as follows:

	Wheat. Tons.	Rye. Tons.	Barley. Tons.
From United States	620,213	136,129	10,293
From Russia	257,339	123,387	177,075

The other contributing countries were Roumania, Argentina, Bulgaria, British East India, Austria and the Netherlands, but in much smaller quantities.

James H. Eckels, Comptroller of the Currency, in a letter to F. B. Baird, vice-president of the Buffalo Furnace Company, stated that, in his opinion, it would not be unlawful to use certified checks as currency, because such a course would involve a contract between the depositor and his creditor, and would be independent of the bank. "As understood, the proposition appears to involve a business contract between the depositors and their creditors, and in my opinion such transaction would not constitute a violation of Section 5183, as the checks will be issued by the depositors and not by the banks. As to a certification of such checks by national banks when drawn against deposits to credit of drawer, I can find no legal objection."

Between 1859 and 1889 India absorbed $561,600,000 in gold and $1,089,600,000 in silver, or $1,651,200,000 in all. What has become of the silver we do not exactly know, says the London *Spectator*, though it is certain that a great proportion of it is hoarded as fixed and visible wealth, but about the destination of the gold there is no doubt whatever. The people have got the whole of it in their own hands, for it is not in circulation, and are using it either in ornaments, kept, be it observed, to pawn in extremity, or as hoarded treasure in coin, such as lies under almost ever peasant's floor in the Punjaub and Eastern Bengal.

Charles D. Kellogg of the Charity Organization Society says that pauperism has for the past ten years increased in a far larger proportion than the population of New York, owing to the vast immigration of indigent aliens.

Business in the iron and steel trades was dead in Sweden during 1892, but hopes of new markets are indulged in from her exhibits at Chicago.

The executive and advisory councils at Honolulu have introduced an act vesting the crown lands of Hawaii in the provisional government and providing for their division and settlement.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

A good all-around TINSMITH; one with experience in furnace and plumbing work preferred; a steady job to a sober, competent and industrious man; give reference and state age and wages desired. A. J. Snow, Fulton, N. Y. Aug. 19

A reliable, temperate and competent TINSMITH for a steady job in a country town 35 miles from New York; one who is familiar with furnace work, can repair pumps and do the work common in a country tin shop; wages $2 a day. "Tin Shop," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 19

A man who thoroughly understands the foundry business in all its branches; must have some capital; manufacturing only staple goods; good profit; splendid opportunity for live man. "Foundry," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 19

A TINSMITH; one used to sheet iron work; must be temperate and honest. F. W. Strong, Dalton, Mass. Aug. 19

TINNER who understands all kinds of tin work, roofing of all kinds, sheet iron and furnace work; a steady job for the right man; state wages. A. & F. Rockhold, Hillsboro, Ohio. Aug. 19

A reliable, temperate TINSMITH who understands general jobbing, roofing, assortment work, and has some knowledge of plumbing and iron-pipe work; married man preferred; experience and reference must be given; steady work if competent. A. T. Skillman, Hightstown, N. J. Aug. 12

At once, a TIN ROOFER: one with some knowledge of shop work; young man preferred; one not afraid to work. "J. C. S. L." Box 262, Raleigh, N. C. Aug. 12

FOREMAN for foundry; a practical man on stove repair work and water backs; must understand handling of men, be sober, steady and honest; steady work to handy man; reference required; state salary expected. "J. M. W.," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 12

At once, a first-class TINSMITH and PLUMBER, who is steady and industrious, having a good experience in each kind of work; steady employment to the right man; state wages. C. Taylor & Co., Sidney, N. Y. Aug. 12

STOVE SALESMEN for the States of Illinois and Iowa to sell a line of new and modern stoves on commission, which has been introduced in this territory; quality strictly first class and prices moderate; only those acquainted with the trade need answer. "Commission," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug 12

A good PLUMBER, who understands hot-water heating; must be strictly temperate. S. Woodhead, 108 Main street, North Adams, Mass. Aug 12

SITUATIONS WANTED.

By a TINSMITH, 22 years of age, 7 years' experience, some knowledge of plumbing, speaks English and German, steady job desired, city or country. "O. E. F.," 216 E. Fourth street, New York City. Aug. 19

A position as SALESMAN by a man of 15 years' experience on the road selling hardware, thoroughly acquainted with shelf and heavy hardware, iron and tinners' stock. "Head," office of *The Metal Worker*, Fifth and Main streets, Cincinnati, Ohio. Aug. 19

A practical STEAM and HOT-WATER FITTER and SALESMAN desires to represent a manufacturer of some special goods in the heating or plumbing line for the States of Pennsylvania and New Jersey. "R. S.," Lock Box 1086, Philadelphia. Aug. 19

By a practical PLUMBER and STEAM and HOT-WATER FITTER; competent to draw plans and specifications, and do all work desired; situation preferred in a city from 10,000 to 15,000 inhabitants. Wilson, Box 619, Schenectady, N. Y. Aug 19

By a practical WOOD PATTERN MAKER, who is thoroughly conversant with furnace work, inside the shop and on the road, as estimator, having been employed in that capacity for 16 years. F. Aldridge, 405 East Eighty-eighth street, New York. Aug. 19

A man 45 years old, 12 years' experience in retail hardware and furniture store; can make myself useful at anything connected with hardware, stove, furniture or tin shop; can take charge of store and would like a position as clerk, or take charge of branch store; I am temperate; Western town preferred; I have a good position now, but I want a change of location; I am a married man; can give the best of references. Z. C. Strong, Oakland, Iowa. Aug. 19

An all-round TINSMITH and SHEET-IRON WORKER; good on furnace, fire place, heaters, roofing, iron pipe, pumps, and all general jobbing, wants steady job by the year in country or city. A. A. Clark, office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 19

By a PLUMBER and GAS FITTER in the West or South; married; temperate; willing to work; wages moderate. Henry W. Bauer, 469 West Congress street, Chicago, Ill. Aug. 19

Steady situation by a PLUMBER; good workman, sober and industrious, understands gas-fitting, hot-water heating and both city and country work; 14 years' experience. "Plumber," 19 Centre street, Yonkers, N. Y. Aug. 19

By a practical and experienced STOVE MOUNTER on bench, floor, drill or patterns; competent in handling men; can furnish good reference. "G. C.," Box 819, office of *The Metal Worker*, 96-102 Reade street, New York. Aug. 19

A first-class furnace and range workman, also used to all kinds of jobbing in city or country shop; tin roofing, pumps, &c., wants steady position now or by September 1; temperate; references. Geo. Anderson, Flushing, L. I. Aug. 19

A man with 18 years' experience in PLUMBING, STEAM and HOT-WATER HEATING trades, and can take charge of any kind of machinery; reference given. "U. S. G. F.," Middletown, Dauphin County, Pa. Aug. 19

A steady, sober, reliable TINNER desires a permanent situation by the year in some first-class shop; have had 22 years' experience at general jobbing, tin roofing, gutters and leaders, mounting stoves, making all kinds of pieced tinware and making milk cans, can do stove and furnace work, can make patterns, lay out work or take charge of a shop; can furnish best of reference, if necessary. "Tinner," care of F. M. Sanford, Litchfield, Conn. Aug 19

As SALESMAN in the hardware, stove and tin business by a young man with seven years' experience; five years as a practical tin and stove man; speaks English and Swedish; A1 references; steady and sober. "J. A. J.," 55 Park street, Rockland, Maine. Aug. 19

As TRAVELING SALESMAN for a reliable stove or tinware manufacturing company, by a young man 23 years old, with six years' experience as salesman in a first-class stove and tinware store; gilt edge recommendations. "G. P. D," 803 Dinwiddie street, Portsmouth, Va. Aug. 19

By a strictly temperate PLUMBER, one who understands all kinds of job tin work; used to estimating and handling men; would like permanent position; 15 years' experience. Box 466, Wellsville, N. Y Aug. 19

As SUPERINTENDENT for steam and hot-water heating firm, by man 35 years old; is capable of taking hold of any kind of work; has had over two years' experience as superintendent and over ten years as practical mechanic; is not afraid of work, and can furnish references as to competency and reliability. "J. H.," office of *The Metal Worker*, 59 Dearborn street, Chicago. Aug. 19

By a young man, 21 years of age, as SALESMAN in a retail hardware store; have had two years' experience; no bad habits, and can furnish references. Box 185, Nevada, Iowa. Aug 19

Permanent situation by a first-class TINNER, 18 years' experience at inside and outside work; married man; good habits. Box 599, Negaunee, Mich. Aug 19

A practical TINSMITH and TIN ROOFER, TIN and SHEET-IRON WORKER; 19 years' experience; city or country. H. Gold, 92 Essex street, New York City. Aug 19

By a TIN and SHEET-METAL WORKER, both in and outside; also hot-air heating in every particular; I have 12 years' experience; can furnish reference; will answer all letters. D. E. Mays, care Virginia Plumbing & Heating Company, Roanoke, Va. Aug. 19

By middle-aged man, situation as TRAVELING SALESMAN in New England States; has had large experience in furnaces, stoves, &c., and some in hot water and steam heating; will travel on salary or commission. "Heating," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 19

By a young man, as PLUMBER; four years' experience in Pennsylvania; would like to be under instructions for another year or so; willing to work and will furnish own tools. Philip Masters, 2196 Second avenue, New York City. Aug. 19

By a young man thoroughly acquainted in stove line, a position to represent a good house on the road; can furnish excellent credentials as to ability. E. Laurence care Keller & Beebe, 129 Beekman street, New York City. Aug. 19

By a young man with six years' experience at plumbing, gas fitting and hot-water heating; steady job desired. "Plumber," 713½ Indiana street, Laport, Ind. Aug. 19

As SHIPPING CLERK, a young man who is well posted in all details, and would make himself generally useful; can give good references. L. Junior, care Keller & Beebe, 129 Beekman street, New York. Aug. 19

STOVE SALESMAN, thoroughly acquainted with trade in Ohio, Indiana and the South; moderate salary until value of services can be determined. J. A. Wilson, 1095 Woodlawn avenue, Cleveland, Ohio. Aug. 12

Two first-class JOURNEYMEN PLUMBERS would like to work in the South. "H. M.," office of *The Metal Worker*, 96-102 Reade street, New York. Aug. 12

By a practical STEAM and HOT-WATER FITTER, 24 years old and strictly sober and reliable, a steady situation, city or country. "A. L.," P. O. box 247, Webster, Mass. Aug. 12

A situation by a young man, 26, as BOOKKEEPER or TRAVELING SALESMAN; have had four years' experience as bookkeeper and one year as traveling salesman; have had experience in wholesale and retail hardware as clerk, bookkeeper and traveling salesman; best of references. B. D. Higgins, Sidney, Ohio. Aug. 12

A practical CORNICE MAKER, CUTTER and DRAFTSMAN; thoroughly understands the business in all branches; can do all kinds of hammer and raised work by hand and machine; has had experience as foreman; can handle help to best advantage; moderate salary "Practical," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug 12

As MANAGER or SUPERINTENDENT of stove works; over 20 years' experience; understands the business in all its details from the office down. "S.," Box 812, office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 12

By a TINSMITH of 12 years' experience, with a good knowledge of plumbing and hot-water and steam fitting; 28 years of age; married; can furnish good reference; city preferred. A. J. Bouchey, 445 Second street, Troy, N. Y. Aug. 12

CORNICE CUTTER desires situation in cornice shop; 20 years' experience. "L. W.," office of *The Metal Worker*, 59 Dearborn street, Chicago, Ill. Aug. 12

By competent man, CORNICE MAKER, CUTTER or FOREMAN; good reference. "R. S. T.," office of *The Metal Worker*, 59 Dearborn street, Chicago. Aug. 12

STOVE MOUNTER wishes a position as inspector, foreman or at the bench or contract, East or West; positively first-class in all branches; late with the Michigan Stove Company; age 31 years. "Modern," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 12

HARDWARE CLERK, 24 years old; having disposed of my wholesale and retail hardware business I would like to engage with some firm as manager or clerk. "Hardware Clerk," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug 12

A first-class PLUMBER and GAS FITTER, having city and county experience, would like a steady situation with reliable firm; best of references given. Fred. Bowers, Lock Box 40, Lykens, Dauphin County, Pa. Aug 12

A position by a young man in a hardware, stove and tin shop; four years' experience; best of references E. L. Carr, 39-41 Main street, Clifton Springs, N. Y. Aug 12

As FOREMAN, by a first-class all-around stove mounter; best and quickest methods. "Western Driller," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 12

By a TINSMITH and CORNICE MAKER, who can cut patterns and do hammering work. Charley J. Sander, Bowling Green, Ky. Aug. 12

As TRAVELING SALESMAN, by a practical job tinner of 20 years' experience, with some good jobbing, tin-plate or hardware house, or position as job tinner, or salesman in a hardware store; 43 years of age and temperate; Western New York territory preferred; at liberty now. J. E. Whitbeck, Phelps, N. Y. Aug. 12

One or two good reliable and industrious PLUMBERS would like a job in any part of the country. "Plumber," office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 12

As TINNER and SKYLIGHT and CORNICE MAKER; can work from drawings and hammering work. John Kylian, 1376 Avenue A, New York City. Aug. 12

By a young man 19 years of age with some good firm to learn plumbing and steam fitting; good habits and steady; can furnish first-class references. Samuel J. Christian, Box 125, Philmont, N. Y. Aug. 12

By a reliable German, 34 years of age, as CORNICE MAKER; good at plans, figures and cutting; New York or vicinity. "A. B.," Box 812, office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 12

A good TINSMITH, 19 years old, single; five years' experience; city or country. Philip Schapiro, care of Sonenschein, 128 Moore street, Brooklyn, N. Y. Aug. 12

A good TINSMITH, 20 years old, single; six years' experience; city or country. Ch. Friedmann, 154 Varet street, Brooklyn, N. Y. Aug. 12

By a young married man, 31 years old, speaks English and German, a steady job the year round as FOREMAN in tin shop and clerk in hardware store; am a first-class tinner and salesman, have had 18 years' experience as both; state wages when writing; can give gilt edge reference as to honesty, sobriety and capability. H. W. Kuehner, P. O. Box 24, Boonville, Mo. Aug 12

Public Works for the Unemployed.

So surely as times of industrial depression come about do labor agitators and unthinking people generally propose all sorts of impracticable schemes for the relief of the workingmen. Some of these suggestions are made in good faith and in the hope that the distress of the unemployed will be relieved; but others undoubtedly originate in the minds of agitators pure and simple, whose sole object is to foster discontent, that out of the trouble some good may come to them which were its instigators. One of the commonest propositions made in such times as these is that the Government assume a fatherly attitude toward the distressed and begin great public works for their employment. This illogical scheme of relief is often proposed and, it is to be regretted, not infrequently acted upon. It gives temporary relief through the distribution of wages to those who have no money. It delays, however, the renewal of general activity, for it is a method of forcing work when demand and supply and other industrial conditions do not warrant it. The Government has no money but such as it collects from the people, and to collect money from the people and then employ them is, as the phrase goes, "robbing Peter to pay Paul." The scheme is a plausible one, however, and many people, particularly among the unintelligent, are captivated by it and use every effort to forward it. To those who are poor and in need of wages for their daily bread it is excusable that this false hope should be relied upon and followed; but it is monstrous that the evil doctrine should be propagated by those who are, or should be, wise enough to know better. One who has obtained a good deal of publicity lately in the work of highway reform urges that Legislatures and municipal authorities take immediate steps to furnish employment in the construction of public works, more especially in improving the highways, and further urges that Congress, after the immediate demands of the session are complied with, pass bills making liberal appropriations for the irrigation of arid lands and other internal improvements. It is a gigantic scheme of paternalism that is outlined, and the originator, if politically ambitious, will undoubtedly rise in the estimation of a certain class of voters. The mischief done, however, by preaching wrong economics should not be forgotten even when one is looking for political preferment.

Imparting Knowledge

To a greater extent than is recognized or is reasonable, an impression exists that to tell a thing once is sufficient. It is natural after something is learned to regard it as simple, though a considerable effort has been necessary to master it thoroughly. Seeming so simple, some other person who is expected to understand it at once is told of it with a briefness that astonishes rather than enlightens. If, after the astonishment is overcome, enough information has been secured to arouse an interest and further inquiry is made, the answer is: "I told you all about it once." This illustrates the conviction, that once telling is enough, which prevails among some excellent people who have never studied the art and noted the result of teaching. That once telling is so utterly insufficient as to be almost useless is experienced at some expense daily in all lines of business. A list of goods is given a stock clerk, a lot of instructions are given a workman, or exhaustive explanations are given a mechanic, once for all, that make it a marvel that satisfactory results follow. Too often all concerned forget some detail, which in the end involve a serious expense and suggests that a more extended explanation be used instead of telling a thing once for all. In imparting information, sufficient time must be taken to make an impression on the mind and to effect a thorough understanding of the subject explained, if the knowledge is to be permanently retained. By carefully following such a plan in imparting information a greater number of the boys now learning trades will make valuable journeymen.

Fire Losses.

The record of fire losses in the United States for the first seven months of the present year points to a very serious condition of things in this field. Fires are shown to be increasing at an abnormal rate, despite the increased efficiency of the means taken for fighting them. It is an open secret that many, even among the strongest fire insurance corporations, are having a hard struggle for existence, and their profits are dwindling while risks increase. The rapid advance in values of property destroyed by fires is demonstrated in the official returns. During the past three years the annual loss has risen from $109,000,000 in 1890 to $152,000,000 in 1892, while the accounts for the seven months of the current year indicate that 1893 will in its turn surpass all previous records, barring the fatal year of the great Chicago fire. Each week brings with it the tale of some great conflagration. A few weeks ago it was in Fargo, then in Long Island City, and this week again we hear of a $2,000,000 blaze in Minneapolis. Indeed, the story has become such a familiar one to American citizens that, except to those directly interested, the fire news in the morning paper has become a weariness to the flesh in its constant reiteration. But, nevertheless, the menace to the prosperity of the country is a serious one, and one that deserves the grave attention of all thinking men.

Some Causes and Preventives.

What is the cause of this rapid increase in destruction by fire? The published opinions of a number of fire underwriters and other authorities on insurance, as expressed of late in the daily press, give two main causes, which are very interesting ones. According to them, the increase in fire losses is attributable to incendiarism, induced by the present financial stringency, and also to the increasing use of electricity in trolley, telephone and electric light and power wires. It is recorded that the latter agent has been directly responsible for the destruction of property during late years at a rapidly increasing rate. Statistics show that in 1885 the value of property destroyed by what is termed "electric fire" was only $250,000. In 1891 the amount had grown to $1,300,000, and in 1892 the cases footed up the large sum of $3,000,000. Besides these cases there were a number of fires put down to "unknown" causes, the origin of which was more than likely due to electricity. Most of these cases, too, were of a preventable nature, by the use of better insulation and greater precaution and care generally in the introduction and maintenance of the electric agent in buildings.

Home Fire Brigades.

Another very simple precaution, also, might have prevented the destruction of much valuable property in manufacturing establishments and stores—namely, the drilling of a portion of the employees as a fire brigade. The advantage of this plan was signally demonstrated lately in a fire in Chicago, when a great store was seriously threatened. The fire was, however, successfully held back by the firm's own brigade, which consisted of a captain and

our men to each of the seven floors of the building. The store had been, happily, equipped with all the necessary apparatus for fighting a fire and the men had been drilled every week in its use. Consequently, when the emergency came, they were found capable of saving the property. This system is followed in several large establishments in and near the city of New York, but its application might with advantage be much more widely extended, and it should be worth while for insurance companies to give more encouragement, by lower rates, to the establishment of similar home fire brigades in all places where large risks and valuable property are involved.

A Strike to Support Fraud.

An extraordinary strike is reported at the works of Clement & Co., who are large cycle makers in Paris, France. As a novelty in trade disputes it is worth recording. The origin of the strike was as follows: It was noticed lately that large thefts of material were being committed at the works, and the police discovered that the culprits were workmen employed at the factory. Several arrests were made, and in one case more than $400 worth of property was discovered in the thief's house. Five men whose offense was a trifling one were dismissed from custody, and re-employed by Messrs. Clement & Co., but action was taken against the remainder. This did not satisfy the rest of the workmen in the factory and they demanded that the whole of the charges should be withdrawn, and that all the culprits should be taken back. On the firm very properly refusing to accede to this request, the whole workshop, numbering 300 men, went out on strike. Messrs. Clement could not very well give way under the circumstances, for capitulation on their part would be equivalent to an admission of the right of the workmen to steal with impunity.

Members of the Boston trade are telling a good story on J. Sidney Smith of the St. Louis Stamping Company, which his friends find a little difficult to believe. It seems that a short time ago Mr. Smith visited the great fair at Chicago, and wandering about the grounds, encountered a person whom he had met casually while traveling. Delighted to see a familiar face, he rushed up with extended hand and cordial greeting, only to be met by a stony stare, followed by a knowing look and abrupt turning away of the party addressed, with the remark that he was not from Wayback and had been duly warned of bunco steerers. Any one who knows Mr. Smith can readily imagine his amazement. The story comes from a reliable source, but it is, nevertheless, somewhat difficult to credit, when taking into account Mr. Smith's eminently respectable appearance, on any other hypothesis than the well-known idea that a successful bunco man must of necessity be particularly smooth in both appearance and address.

In these dull times there is a great deal of monotony in the replies of manufacturers and dealers to well worn questions as to the present condition of business and future prospects. However, once in a while one hears something out of the ordinary rut, as, for instance, on Blackstone street, Boston, recently, one of the trade discussing the situation and making a guess at the future, remarked that the coming season would be an old-fashioned winter, and that, in a business sense, it was likely to snow in bed.

Prehistoric Steel Casting.

With our usual desire of keeping our readers informed of all that goes on, says *Industries and Iron*, we sent our metallurgist to represent us at a recent performance of "Siegfried." He reports that the art of casting steel is quite old, as it was known in prehistoric times. The only property left to Siegfried was a broken sword. This Mime, obviously a registered plumber, had failed to mend; so Siegfried, a non-union man, decided he would repair the article. Mime told him to solder it, as far as could be made out. As our readers are aware, "Siegfried" is the third volume of a four-volume opera, and as, according to the genius of the German language, the verbs all come at the end of the fourth volume, at whose performance we have not been represented, we cannot give accurate details as to the proposed method of soldering. Siegfried, however black his character in other ways, was no plumber, and as the sword was not for the British army, he refused to repair it with solder. He clamped the pieces in a 15-shilling vise, being unacquainted with the quick-gripping kinds, and filed it into "shreds," which shows the curious molecular structure of early cast steel. The prehistoric fitter holds a 14-inch rough-cut in one hand, and gives it a see-saw motion, while he waves the other hand above his head and sings lustily. Finally the shreds were put in a Battersea 5-pound crucible, which was perched on the top of a cool part of the fire. After being sung at for a little time the shreds succumbed and fused, and were poured into a mold resembling one of the cases in which fish slices for wedding presents are sold. The whole mold was then quenched in water and the finished blade taken out. Siegfried poked the fire with it, laid it on the anvil and hammered the anvil, producing sparks that must have made the lamps of the other consumers on the Metropolitan Electric Supply Company's circuit jump badly. The blade was now finished. If Siegfried had had any of the blood of the famous Ritter Kuno in his veins, he might have utilized the dragon's blood for tempering the sword, as Fafner's internals were at about 1000° C., and glowed through cracks in his sides. The sword finally cut the anvil clean in two, or would have done so if the anvil had not fallen in two before the sword was even raised, the catch having been released prematurely.

A new porcelain has been obtained in England from asbestos. The mineral is ground to a fine powder, and all soluble matters are dissolved with hydrochloric acid. The powder is then made into a paste with water and baked in a porcelain furnace for 18 hours at 1200° F.

An agreement has been signed by the Pacific Mail Steamship Company and the Panama Railroad Company whereby the former charter to the railroad company their three ships running between New York and Cuba.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

WILEY & CALHOUN of Portland, Maine, have been awarded the contract for heating the new Masonic Building and the Fletcher Block in Camden, Maine.

AMONG the improvements to be made at the Grace Church, Oswego, N. Y., is a new steam-heating apparatus.

THE County Court of Memphis, Tenn., is receiving bids for repairing the Court House, which will include a new steam-heating plant.

RUFE BROS. of Doylestown, Pa., have been awarded the contract for heating St. Alphonsus' Parochial School and Convent at Philadelphia, Pa.

FRED STOYLE of Houghton, Mich., has secured the contract for the plumbing at the new Lloyd House at L'Anse.

STREVEIL & BESORE, Miles City, Mon., have secured the contract for heating and ventilating the Montana State Reform School. They will use the system of the Bennett & Peck Heating & Ventilating Company, Cincinnati, Ohio.

GOOD TRADE is reported by the Bennett & Peck Heating & Ventilating Company, Cincinnati, Ohio. Among the contracts that have been awarded to them are the school building at College Hill, Ohio; building for the Board of County Commissioners at Dayton, Ohio; school building at Carrollton, Ohio; Jackson County Court House at Brownston, Ind.; school building at Lynchburg, Va., and two school buildings at Gainesville, Texas.

AFTER an animated discussion before the school inspectors of Detroit, Mich., the system of heating the new Central High School Building submitted by the Huyett & Smith Mfg. Company of Detroit was selected and the contract awarded at a reported price of $24,100.

R. BARNEY has been awarded the plumbing contract for placing 18 new closets in the Division Street School and 17 in the High Street School at Ishpeming, Mich.

NEW steam heating apparatus is soon to be placed in the library building at West Brookfield, Mass.

THE city of Westfield, Mass., regard the Fuller & Warren system of heating and ventilating put in the Union Street School house as the most important change made in any of the school houses this year.

GEO. D. HOFFMAN, 82 Lake Street, Chicago, is placing a 25 horse-power boiler in the basement under his sales room to furnish power for electric light plant, pipe cutting machines, and for heating purposes. He has recently contracted to furnish two Economy warm-air heaters for the school building as North Dixon, Ill.; one for the residence of Geo. Wood, Prairie avenue, Chicago, and one for the residence of Mrs. F. M. Snow, Longwood, Ill. Among the contracts recently taken for steam heating can be mentioned the Post Office building at Englewood, Ill.; residence of O. M. Hagen, Wellington avenue, Chicago; apartment building of H. Murphy, Indianapolis, Ind.

THE officers of the Congregational church at Kenosha, Wis., have decided to put a new heating apparatus in the church. It is understood that the hot-water system is to be introduced.

TIN PLATES.

Closing of Welsh Tin-Plate Works.

Latest advices from England announce that Morewood & Co. have posted notices at their great tin-plate works at Swansea and Llanelly, Wales, terminating contracts with their employees in 28 days. The reasons given are variously stated as uncertainty of coal supplies, in view of the great strike of coal miners, scarcity of orders, &c. The firm, however, have assigned no reason for their action. In regard to the matter the *Western Mail* of Cardiff, Wales, has the following remarks :

It is easy to understand the uneasy feeling created throughout South Wales by the sudden and quite unexpected month's notice given to all their employees by Messrs. E. Morewood & Co., the largest tin-plate makers in the world. It affects directly 3000 workmen, or something like 18,000 persons, taking the families of the workmen into account. The great cause of the uneasiness excited by the notices is not the temporary stop which is likely to follow, bad as that will be, but the fear of worse things to come.

Messrs. Morewood & Co. assigned no reason. But at Llanelly, at Burry Port and at Cwmbwrla there are disquieting rumors. Those who look only at the bright side are saying that the notice is only a precaution rendered necessary by the gigantic coal crisis upon which the country is entering. Others think if that were the only reason the great firm would have said so in one way or the other.

But deeper speculators point to the undoubted fact that the United States of America are the best customers of Welsh tin-plate works, and that the financial difficulties which are playing such havoc with American trade and commerce must naturally affect sooner or later the American demand for Welsh tin plates. To some extent this surmise must be more or less true.

The great dread at Llanelly and throughout South Wales, if it were honestly voiced, is that the new works of E. Morewood & Co., at Port Elizabeth (Elizabethport) and Indianapolis, have the chief part in the notices given to the firm's Welsh employees. It is not well to meet trouble half way, and in this case there is no need as yet.

SCRAP.

THE GENERAL STRIKE of coal miners in Great Britain will bear hardly upon the Welsh tin-plate works and rolling mills in causing scarcity of fuel and advance in its price. Writing under date of August 12, the Swansea correspondent of *Ryland's Iron Trade Circular* of Birmingham reports as follows: "A great many of the tin-plate makers stated to-day that, even without any advance in the price of coal, they would be better off if they stopped, as the present price of tin plates is considerably below the cost of make, while the demand seems to go from bad to worse, with very little prospect of any immediate improvement. Some recent sales are said to have been made at extremely low figures, but we are unable to obtain correct information upon the point, but it was hinted that something like 10 shillings 6 pence basis had been accepted, and it is questioned whether plates can be manufactured at anything like this figure; therefore, a greater increase in fuel will bring about a climax such as the manufacturers will have no hesitation in stopping their works as the only remedy open to them."

BRITISH BOARD OF TRADE RETURNS for July, 1893, give the exports of tin plates and sheets to the United States as 22,248 tons, a falling off of 2500 tons from the figures for the corresponding month of last year. The tin-plate shipments to this country for the first seven months of the year are given as 182,668 tons, valued at $11,331,450. Total exports of this material from Great Brtiain show for July an increase of 7.2 per cent. over those of July, 1892; augmented shipments to Russia and other countries more than compensating for the falling off in exports to the United States.

A PRESS DISPATCH from Milwaukee, Wis., dated August 19, said: "The Collector of the Port of Milwaukee was to-day obliged to store large quantities of tin plate because the importers do not come forward and pay the duties. The duties on that now in store at this point amount to about $35,000. The reason assigned by the heaviest importer for the accumulation is, that Congress is sure to take the added duty off tin plate soon, and if he holds on until that time he will get rebate equal to the reduction, which will amount on the present lot to about $10,000."

IT IS REPORTED that the output of tin from the Malay Peninsula will be largely increased this year.

THE AMERICAN TIN PLATE COMPANY, Elwood, Ind., experienced lately some difficulty with their Welsh tin platers, which has, however, been satisfactorily adjusted. The trouble is said to have been caused over the operation of the automatic tinning machines, the operators employed on the machines demanding to be paid skilled labor wages, and this demand being refused by the firm.

THE WORKS of the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., have started up again after a close down of some weeks. The departments put into operation are two furnaces, one sheet mill, three tin mills and four stacks. Three hundred men are in employment, including skilled mechanics and laborers.

FALCON TIN PLATE & SHEET COMPANY, Niles, Ohio, have been rolling some excellent specimens of sheet steel for high-grade tin and terne plating. This special assortment of samples was prepared with a view to their being subjected to the severest test by an old established importing house who during the past year or so have been tinning their own plates. The sheets were smooth and very creditable in appearance. It is the desire of the Falcon Company to have them critically tested for weaknesses, if there are any. George H. Ismon, 277 Broadway, New York, is the sales agent.

A ST. LOUIS DISPATCH of August 21 announces that the works of the St. Louis Stamping Company, which have been idle for nearly two months, will resume operations on Monday. The tin-plate plant will start up at the same time.

THE PONTARDAWE TIN PLATE WORKS of Gilbertson & Co. have lost 200 men in the tinhouse department by a strike ordered by the officials of the Tin Plate Workers' Union of Wales. The steel works and mills belonging to Messrs. Gilbertson were still in operation by last accounts, but it is believed the owners will have to close them, throwing 500 men out of employment. The dispute is regarded as the more lamentable that for 34 years there has been the best feeling between employers and employed at the Pontardawe works, and work has gone on uninterruptedly for the whole of that period.

THE SCHEDULES in the assignment of N. L. Cort & Co., importers and dealers in tin plates, 245 and 247 Water street, New York, who recently assigned to Frederick G. Dow, show liabilities $377,062.58; nominal assets $354,333.49; and actual assets $348,434.92.

OWING TO SCARCITY of orders, and the coal difficulty in Wales, the Morfa Tin Plate Works of Tregonning & Son, at Llanelly, were closed down last week, and 600 workpeople were thrown out of employment. According to a cable dispatch of Thursday last, the example of this firm, and of the Morewoods, has been followed by a majority of the South Wales tin-plate works.

The regular monthly meeting of the Western Foundrymen's Association should have been held in Chicago on the evening of the 16th inst., but the attendance was so small that an adjournment was taken until September 20. An effort will be made to arrange to hold this meeting in the rooms of the Associated Engineering Societies, at the World's Fair. The topics to be discussed are those intented for the meeting of last week.

A Pacific Coast journal states that 27 canneries are packing salmon on the Fraser River this year, and 1325 boats are at work. The fish are said to be running in immense numbers, and prospects were never better than at present. The canneries cannot handle the quantities of fish supplied them, though some of them are packing 1500 cases daily.

Barbed-wire fences will no longer be allowed in England in roads, lanes or other thoroughfares, according to a bill recently passed through the British House of Commons. The bill empowers the removal of any such fences after due notice served.

THE LETTER BOX.

Tin Importations.

From SUBSCRIBER, *Columbia City, Ind.*—Please inform me what amount of foreign tin was used in the United States in the years ending June 30, 1892, 1891, 1890 and 1889? I noted the figures given in *The Metal Worker* for the year 1893 and wish to compare them with former years.

Answer.—We have not the statistics of consumption and stocks on hand during the preceding years, but a comparison between the total importations of tin will probably answer our correspondent's requirements. For the sake of comparison we reprint the total importations of tin for the year ending June 30, 1893, in connection with the other years:

	Pounds.
Year ending June 30, 1893	61,076,464
Year ending June 30, 1892	43,908,652
Year ending June 30, 1891	39,787,622
Year ending June 30, 1890	34,993,099
Year ending June 30, 1889	33,877,287

Trouble With a Well Cooler.

From J. W. B., *Brockton, Mass.*—I notice in *The Metal Worker* of August 19 that "E. D. S.," Atlanta, Ga., has endeavored to rectify the mistake of "P. R. F." in arranging a water cooler and advises that the inlet should be on the upper side of the boiler or cooler and the discharge taken from the underside. I think, however, he would have the same trouble in Fig. 1 or Fig. 3 as did "P. R. F." With the tank filling from the top side, what would become of the air after the discharge pipe becomes filled, on a level with the water in the tank? It seems to me it is going to remain there. If he will just reverse his connections he will have his cooler filled with water without the cooler being partly filled with air. As the air is the lightest it will rise to the upper side, and as the water takes possession, beginning at the lowest point, the air will make its escape through the discharge pipe.

Preventing Tin Roofs from Rusting.

From A. & N., *Waterloo, N. Y.*—What is the best thing to do to prevent tin roofs from rusting on the under side? We are aware that painting the tin before it is laid is considered a good preventive, but is there not a better and more effectual way? Is it a good plan to lay sheathing that is impervious to moisture under tin?

Answer.—It must be evident that the rusting of tin roofs on the under side is caused by the moisture from below condensing on the under side of the tin. This condensation is liable to take place when the warm air below is charged with moisture and the external air is at a low temperature. By painting the under side of the tin it is protected from the moisture, providing the entire surface of the tin is covered with paint. By placing a water-proof paper between the roof boards and tin, it is probable that much of the moisture will be prevented from reaching the tin. Another method that might be suggested, and one that has been found effectual under various conditions, is to ventilate the space between ceiling and roof, thus allowing the moisture to escape.

Tapering Furnace Pipe.

From W. B. S., *Boston.*—I note in your issue of August 12 a question by "J. F. T." regarding taper furnace pipe. As you intimate in your note, this is a question that can only be settled experimentally and by practical experience. Some reasonable deductions can, however, be made from a theoretical standpoint. It is true, as you state, that with the pipe, as specified, tapering from 12 inches to 9 inches, all of the air must pass through the 9-inch aperture. This is then a measure of the volume but not of the weight, and while the cooling effect due to passing 12 feet through the pipe would be slight, yet it would be such as to increase the density—*i. e.*, the weight per cubic foot—as the pipe receded from the furnace. It would therefore seem best for this reason to place the smallest end where the air is most dense—that is, furthest from the furnace. But as the freedom of exit from the furnace depends on the increased area into which the air flows, this condition is, on the other hand, only to be found where the small end of the pipe is at the furnace. As the heated air rises within the furnace casing, its velocity is sufficient to give it considerable momentum, tending to actually throw it into any opening that may be presented. The relative location of openings must have much to do with the resulting action of this moving air, but under equal conditions the tendency would be to throw the greatest volume through the pipe when the 12-inch end is presented rather than when the 9-inch end receives the air. As the loss of heat from the pipe is proportional to the difference in temperature between the air within and that without, the most rapid cooling would take place nearest the furnace. If the large end of the pipe is at the furnace the larger area of pipe surface (due to its greater diameter), coupled with the higher temperature, will allow the loss of heat per foot of length of pipe to be more rapid than if the pipe were reversed. For by this arrangement of larger end at the furnace both the difference in temperature and the radiating surface decrease as we recede from the furnace. This results in denser air at the 9-inch end and hence a greater air movement. The loss by friction must be slight, but as it varies with the square of the velocity, the greatest loss must occur where the greatest volume is passing through the pipe. It would thus seem from the deductions here made that the greatest discharge would result with the larger end at the furnace, but as the heat units admitted to the room are the true measure of the efficiency and as one of the results of this arrangement would appear to be the discharge of cooler air even if of larger volume, it must be acknowledged that the whole question seems to be one of such fine calculation as to indicate that no practical difference in the results would be obtained whichever way the pipe may be placed.

Nailing Sheets on a Flat-Seam Roof.

From F. R., *Meriden, Conn.*—Please decide through the columns of *The Metal Worker* which of the two ways shown in the sketches is correct for

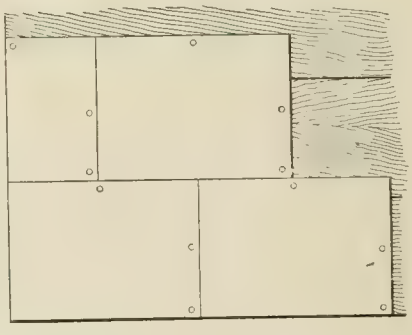

Fig. 1.—Nail in Middle.

placing nails in 14 x 20 inch tin on a flat-seam roof. Only three nails are to be used for each sheet. Would it be preferable to fasten the tin at the middle of the sheets, as shown in Fig. 1, or at the corners, as shown in Fig. 2?

Answer.—The method of nailing shown in Fig. 2 we regard as the better one when but three nails are used

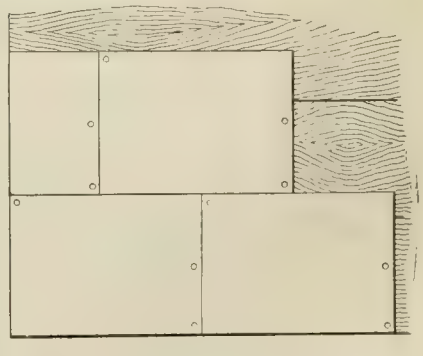

Fig. 2.—Nail at Corner.

for each sheet. If nails are driven at points as shown in Fig. 1 it is evident that they only serve to hold down the sheets properly at those points, leaving the entire length of the lock between the cross seams without any fastening but that afforded by the lock itself. On the other hand, nailing the sheets as shown in Fig. 2 fastens them firmly to the roof and tends to distribute the nails to better advantage around the edges of the sheets.

Brazing Small Articles.

From H. O. D., *Easton, Pa.*—I would like to be informed how small brass pipes and ornaments are brazed.

Answer.—Brazing, or hard soldering, consists of uniting metals by means of solder that is almost as hard as the metals to be joined. Thus brass is brazed by means of spelter solder or silver. The work to be joined is prepared by filing or scraping so the edges will be perfectly clean, when the parts are put in proper position and secured together by means of binding wire or clamps. The granulated solder and powdered borax are mixed in a dish with a little water and spread along the joint, using a V-shaped strip of metal or a small spoon for the purpose. If the work is of suitable shape it can be heated gradually over a clear fire until the water used for mixing the solder and borax is evaporated, and when the borax becomes dry the heat can be increased until the borax and solder fuse. The borax first melts and runs along the work like glass, and upon the application of more heat the solder also melts and should fill the joint. When spelter solder is used the point of fusion is indicated by a small flame caused by the burning of the zinc. If the work is of small size, it can be secured to a piece of charcoal by means of wires, and the heat applied by using a lamp or gas jet and the ordinary blowpipe. Another kind of support for the work can be made by taking a piece of sheet iron 4 or 5 inches in diameter and bent up at the edges so as to form a pan about ⅜ inch deep. This pan is to be filled with a matting formed of pieces of binding wire, or a number of layers of fine wire cloth. The work to be brazed is laid on the matting, which becomes heated from the flame but does not burn away like charcoal. If a pipe is to be made, the metal is formed to shape and bound with wire. A V-shaped strip of metal is then filled with the spelter solder and borax, run in the pipe and turned over, thus placing the spelter over the joint. The pipe can then be brazed by holding over a clear fire until the spelter melts, the pipe being drawn along until the seam is completed. For the brazing of larger work than can be done by means of the ordinary blowpipe, it is usual to employ one using illuminating gas and air. This form of blowpipe requires about one part of gas to eight of air. Two tubes are used, one within the other, the smaller for gas and the larger for air and provided with stop cocks for regulating the supply of each, so a clear blue flame will be the result. Rubber hose is attached to each tube and connected with the gas and air supply, the latter usually being furnished by means of a blower. A sheet-iron pan is to be partly filled with coke, on which a few pieces of charcoal are laid, when the blowpipe can be used to ignite the charcoal. The work is then laid on the charcoal and the flame of the blowpipe is brought against the work until the spelter melts. By placing the work on the ignited charcoal heat is applied below, which helps to melt the spelter and causes it to flow through the joint.

Sheet-Metal Trade School.

From T. C. G., *Newark, N. J.*—Is there in New York or its vicinity a tinsmiths' or sheet-iron workers' trade school?

Answer.—We regret to say that, so far as we know, the pattern-cutting trade is not taught in any of the trade or manual schools in this vicinity. It is a very important branch, and we know that attempts have been made in other places to introduce it as a special course, but heretofore without success. We think there is an excellent opportunity for work of this sort in connection with trade schools, and we know from inquiries received that there are many young men who are desirous of learning the art of pattern cutting in this way. If any of our readers know of a place where this instruction can be obtained we shall be glad to receive the information.

Plumbago.

From E. D. S., *Newman, Cal.*—Please tell me in *The Metal Worker* the price paid for plumbago in its raw state. What is it used for besides foundry facing and axle grease?

Answer.—The price paid for plumbago varies from a small fraction of a cent per pound for the common article for which there is very little market, to less than 2 cents for the high-grade article. One way of testing its quality would be to grind it so that the dirt could be separated by being thrown in running water, the pure plumbago floating off. Plumbago is used in many articles and trades, a few of which are crucibles, paint, stove polish, lubricants and electrical goods, but in all a high grade is sought.

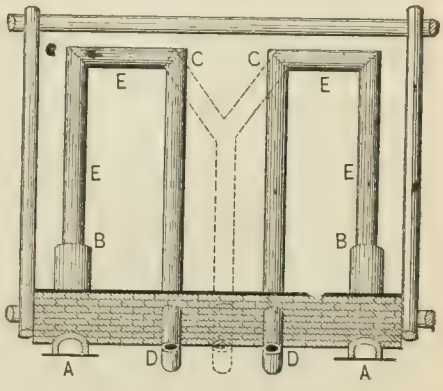
Tobacco Drying Apparatus.

We are indebted to A. C. Vandiver of the Agricultural Experiment Station at Columbia, Mo., for a pamphlet on tobacco by Major R. L. Ragland of Henry County, Va., sent in answer to the inquiry of "T. A. S.," Nashville, Tenn., in *The Metal Worker* of August 5. We give the following extract on "Flues and Flue Curing:"

Flues have almost entirely superseded charcoal for curing yellow tobacco, as being cheaper and better every way. The heat is more readily controlled by the use of flues—an important item in successful curing—and the tobacco cured therewith is cleaner, brighter and sweeter than that cured with charcoal. The flue is, moreover, the best mode of applying heat in the curing process of any type of tobacco requiring the application of artificial heat, and may be used to good advantage in drying out and seasoning those types cured mainly by sun and air and preserving them from injury. Its use is fast superseding the open wood fire with its objectionable smoke. The following cut represents the furnace-and-pipe flue more extensively used and is not patented. It is cheap and reliable, easily constructed and controlled, safe and may be relied upon to work well: Cut out two or three logs from the end of the barn, as represented by the brick work; then construct two furnaces, A B and A B, with brick or stone, as follows: Let the mouths of the furnaces A A project 15 inches outward beyond the wall—the cut fails to show the projection properly—and extend the furnaces to B B about 5½ or 6 feet. The outer wall of the furnaces should be about 15 inches distant from the logs or sills of the barn. Build the walls of the furnaces 18 inches apart and 18 inches high at A A, running back to 14 inches high at B B, and let the bottom of the flues slope upward from 4 to 5 inches from A A to B B. The furnaces should be arched with brick or covered with fire-proof stone, or No. 16 or 18 sheet iron, from A to B.

Be careful to see that the furnaces at every point are so constructed as not to come in near contact with the sides or walls of the barn, lateral or vertical, and that the exits of the pipe are protected by brick or stone, as seen in the diagram.

Insert sheet-iron pipes at B B on cast-iron eyes made for the purpose and placed into the ends of the furnaces, as near the tops thereof as possible. The eyes are not absolutely necessary, but they greatly protect the pipe from burning, and, being fixed into the ends of the furnaces, the pipe is more readily adjusted. For a 20 x 20 foot barn use pipe 11 or 12 inches in diameter; for a barn 16 x 16 feet use 10-inch pipe. Extend the pipe all around from B B to D D, with a gradual elevation of 1 foot from B to C and with 2 feet elevation from C to D. Cap the ends of the pipe with an elbow. For small barns the pipes may be brought together, as shown by the dotted lines, midway between C and C by a Y connection into one 12-inch return flue through the middle of the barn. This flue operates very well, and is very popular with planters working a small force and using only small barns, which are better for them than large flues, and this is the cheapest good flue made.



Tobacco Drying Apparatus.

Any tinner can make the pipe, and foundries and hardware stores furnish the eyes. The cost of pipe varies from 5½ cents to 6½ cents per pound, and 10-inch cast eyes cost about $2 a pair, and 12-inch eyes about $2.50. The cost of piping for a small barn varies from $8 to $10 or less.

From A. G. S., *Dayton, Tenn.*—In reply to "T. A. S.," in *The Metal Worker* of August 5, there is no special heater made for tobacco drying. Usually a brick fire chamber is made and smoke pipe run around the barn on a slight incline to the flue.

A correspondent writes us that "T. A. S.," Nashville, Tenn., can get information about tobacco drying apparatus by addressing H. C. Bare, Alderson, W. Va.

PLUMBING and GAS FITTING.

Registration of New York Plumbers.

The new law for the registration of plumbers in New York State goes into effect September 1, yet there are over 400 plumbers in this city who have made no application to the examining board to comply with its requirements. This law, as originally passed, was to go into effect March 1, but by special legislation the time was extended to September 1 to enable its provisions to be carried out. The fact that it did not go into effect March 1 may have led some to believe that it became obsolete, but it is to be feared that they will suffer inconvenience if they hold to this view. However, this cannot be true of the great number who have failed to comply and they should take the necessary steps at once by filing an application with the Chief Inspector of the Department of Building at Fourth avenue and Eighteenth street. Even this will leave a large number to be examined after the law is in force and only a generous interpretation of it will permit the applicants to transact business until the result of their examination entitles them to a certificate or forces them to suspend business until they can show the necessary qualification. There is a limit to the number that the board can properly attend to in a day and it will be impossible for them to examine the tardy plumbers before the date fixed if all should make application. Those, however, who fail to provide themselves with the necessary papers, according to the law, will have no one to blame but themselves should they feel its force.

A Review of Recent Plumbing Practice.*

BY GLENN BROWN, F.A.I.A.

(Concluded.)

VENTILATION OF THE PIPE SYSTEM.

The fresh-air inlet and the soil pipe opening above the roof is, I think, now approved by all who have given the subject consideration. I am sorry to say that trap ventilation—*i. e.*, a vent pipe from the crown of the trap—is a matter still in dispute.

I have space simply to touch upon this subject in such a running review as I have been requested to make. Experiments have been made by Lissauer in Germany, S. S. Hellyer in London, Philbrick and Bowditch in Boston, the Master Plumbers' Association of Worcester, and Glenn Brown of Washington. The conclusion is drawn by each of the above experimenters that trap ventilation is the best method of preventing syphonage and back pressure. George E. Waring of Newport and J. P. Putnam of Boston deduce from their experiments that trap ventilation is a fallacy. The five experimenters first mentioned draw their deductions from the fact that it is practically impossible to syphon or force by back pressure a properly ventilated trap, while all unventilated non-mechanical traps are liable under one contingency or another to syphonage and back pressure.

Although the conclusions of Messrs. Putnam and Waring are the same, they are drawn from diametrically opposite standpoints. Mr. Waring concludes that vents are useless because traps will never syphon in ordinary contingencies. From his experiments Mr. Waring must admit that traps are better protected with vents. Mr. Putnam concludes that vents are useless because vented traps under ordinary circumstances are never safe against syphonage. Messrs. Putnam and Rice, who conducted their experiments jointly, are the only experimenters of the seven who conclude that trap ventilation is useless because of non-protection.

Dr. Lissauer, S. S. Hellyer, E. S. Philbrick and E. W. Bowditch, and the experiments at the Museum of Hygiene, show the necessity and utility of trap ventilation, to protect the seal from both back pressure and syphonage. All the contingencies that would be likely to occur in ordinary practice are covered by one or the other experimenters, traps mechanical, non-mechanical of varying sizes being used, long and crooked vents of varying size and length being used by S. S. Hellyer and at the Museum of Hygiene; small and large waste pipes being used by S. S. Hellyer and E. S. Philbrick; the effect of syphonage by momentum being specially tested by E. S. Philbrick; the effect of discharges in stories above and below the traps being tested by all the experimenters.

From Mr. Waring's experiments I would draw the conclusion that ventilation is a necessity, although he draws the opposite conclusion therefrom. Traps unventilated were syphoned with soil pipe open, while his vented traps in other positions were not syphoned, even when soil pipe was closed.

The experiments of J. P. Putnam are the only ones which show failure by syphonage and back pressure in almost every case with vented S-traps. Taking in consideration the results of the six other experimenters, the results shown in those of Mr. Putnam must be attributed to the unusual form of his apparatus, he having adopted unusual combinations. Mr. Putnam's experiments apparently show that the Sanitas and the larger pot traps resisted back pressure. The reason for this was that his apparatus was arranged in the most favorable manner to prevent back pressure, a straight soil pipe with the minimum amount of friction and a fresh-air inlet open. Now, in actual practice the soil pipe often necessarily has offsets and bends, and the fresh-air inlets in 75 per cent. of actual cases (the small perforated covers) are closed or partially closed by dirt, when the maximum of back pressure would be encountered, and when no trap in ordinary use would have sufficient water to counteract the pressure. Then all the water in the trap is not necessarily driven in the pipe above the trap, but air is forced back through it, usually in bubbles, the water passing up partially above the trap and falling back.

Even should Mr. Putnam's proposed method—*i. e.*, placing the trap at a sufficient distance below the fixture—prevent back pressure, I do not see how it could in practice be applied to any fixture—except wash basins and sinks; we could not go sufficiently below the floor for bathtubs. Mr. Putnam does not offer us a substitute for the S-trap in plain hopper closets, slop hoppers, &c., or object to the foul matter between the basin and trap. That trap ventilation is necessary for large S-traps under hopper closets, slop hoppers, &c., I think even he would admit. The danger of sewer air passing in bubbles by back pressure has been questioned. Sewer air is dangerous only in case disease-producing germs are in it, and in this case bubbles passing through by back pressure would be dangerous.

Prof. Raphael Pumpelly, in his experiments, covers this point of danger in bubbles passing through traps I quote from the national Board of Health Bulletin 13.

The conclusions from the experiments are given by Professor Pumpelly in the following words: "At normal summer temperatures no germs were given off from the decomposing liquids whenever their surfaces remained unbroken, even though in some of the experiments the air was continuously conducted over them in a slow current. When the surfaces of the liquid were broken, however, by the bursting of bubbles, germs were invariably given off and sterilized infusions infected, no matter how slowly the aspiration was conducted."

Since the above experiments were made J. E. Denton made similar ones on ball traps, tortuous passage traps, without vents, and on S-traps with vents, and with the McClellan vent. They prove only what has been already proved in previous experiments, that properly vented traps are better than others. The bulk of these experiments were with the McClellan inlet, showing it to be equal to a vent 13½ feet long of 1½-inch wrought-iron pipe, with two elbows. In neither case does this protect against back pressure. It proves that the 3-inch vertical vent should run parallel with soil pipe, the only thing that will prevent the severest syphonage and back pressure.

The deductions to be drawn from the above facts are:

1. That unventilated traps are liable to fail from either or both syphonage and back pressure.
2. That small traps should have vents the size of the trap, and the main vertical vent should be 3 inches in diameter in ordinary dwelling houses, computed for larger houses
3. Ventilated traps do not fail by either back pressure or syphonage.
4. That ventilation through pipes of the proper size should be required in all specifications.

STOPPAGE OF VENTS.

There is one point which it seems proper to mention in connection with trap vents —*i. e.*, the claim that they are stopped by accretions from the grease and other matters thrown into them by the water passing through the trap. I have been making inquiries as to old traps taken out and have never found vents stopped, with the exception of a few found in water-closet traps. Recently I had a vent opened in a 1¼-inch S-trap, under a sink, in constant use by four or five families in a tenement, for kitchen and other slops, which, to my knowledge, had been in use constantly for between four and five years. The 1¼-inch vent was attached directly at the crown of the trap by a wiped solder joint in the common way without being bell-shaped or enlarged. The use to which it had been subjected, the position and method of attaching the vent, made conditions the most favorable for stoppage. The vent was found entirely free from accretions; there was probably 1-16 inch of grease and slime on the sides of the trap and vent. The point of attachment and the vent were cleaner than the trap. From this and numerous other inquiries I have made, I conclude that trap vents stop from such accretions only under peculiar conditions. Traps are now made to prevent such possible accretions.

Trap ventilation is important, not only on account of syphonage, but because the constant current of air passing through the trap hastens the division of decayed matter into its constituent gases. The question of increased evaporation caused by trap ventilation is one, I think, of little practical importance, as failure is never likely to occur from this cause, except in unoccupied houses, and in cases of this kind, either ventilated or unventilated traps should be specially looked after.

Methods of testing pipe systems: The smoke and peppermint tests are of little service, as they do not represent any pressure; filling the pipes with water or testing them with compressed air, the pressure showing on a gauge, being the only reliable methods.

*Prepared for convention American Institute of Architects. Read by courtesy of the institute at World's Congress of Architects in Chicago, August 4, 1893.

APPARENT RECENT IMPROVEMENT IN PLUMBING FIXTURES.

I say apparent because many have not been in use long enough to give the guarantee which time alone can give.

Water closets: Several years ago, in the preparation of my work on water closets, I stated that the only objection to the short hopper closet was the small water surface; but even with this defect I considered it the best form in the market. Quite recently two manufacturers, Dalton & Ingersoll and J. L. Mott, have put upon the market short hopper closets with enlarged water surfaces, which is a decided improvement. These forms, from their extreme simplicity, efficiency and cleanliness, still keep this class of closet in the lead. I consider the different forms of syphon closets the next best. Quite an improvement has been made in the seats of closets by attaching the seat and lid to the bowl itself; in this way the seat is detached from the wall and the space behind the closet is open to inspection. Cooper and Mott have introduced such seats.

The introduction of porcelain and earthenware sinks, laundry tubs, slop hoppers and other fixtures is a great addition to healthfulness. Such things are too costly for the ordinary householder.

The wood fiber plumbing fixtures are neat and cleanly in appearance, light and easily handled. I have not yet had much experience in their durability.

The new copper-lined steel bathtub is an improvement worthy of notice for houses of moderate cost.

The great gain in recent years from adopting open fixtures, tiling and doing away with wood work in the bathroom is so well known, although of recent adoption, that it scarcely seems necessary to call attention to the fact.

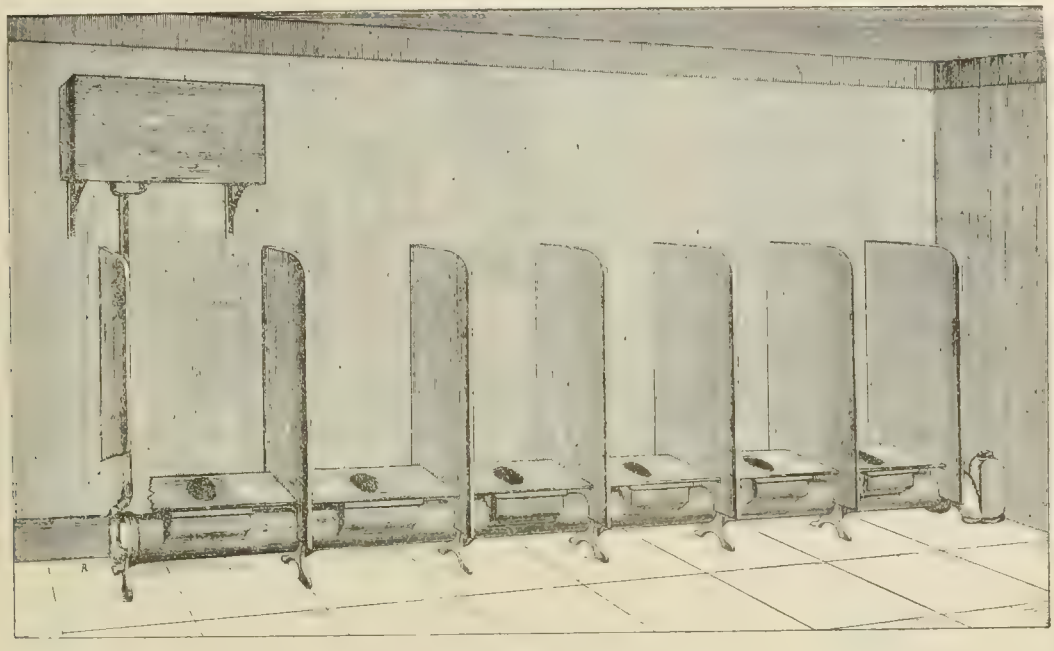
A CLAMBAKE at Rye Beach on August 29 is to be the diversion of the master plumbers of New York in continuation of an annual custom long since established, which is considered as advantageous as it is pleasant to the association.

The Syphon "Eduction" Closet Range.

The Walcott-Hurlbut Company, 175–177 Lake street, Chicago, are introducing to the trade the Syphon "Eduction" closet range, which is said to have all the advantages of separate closets and to be a perfect sanitary substitute for trough closets. As shown in Figs. 1 and 2, the closets are made in sections, and they can be increased by adding any number of sections desired. The supply tank above the closets is filled from the water supply, a cock being provided for regulating the time between intervals of flushing. In this tank is placed the syphon, which has no movable parts.

The syphon is an adaptation of the Field-Waring patents, with Poore's breaking device to flushing closets and urinals. The syphon consists of an annular intaking limb, at the top of which is an annular mouthpiece, the bottom of which is tapped to a less diameter. The discharge limb has a brass cup suspended under the lower end of it. The syphon is brought into action (the tank being filled) by means of a small stream of water flowing over the annular mouthpiece and falling free of the sides of the discharging limb. As soon as the lower end of the discharging limb has been sealed by the filling of the cup, the falling stream of water gathers up and carries out with it a portion of the contained air, thus producing a slight rarefaction. This causes the water to rise and overflow the mouthpiece of the discharging limb, causing more rarefaction. This continues until the syphon is brought into full play. On the tank being emptied to the bottom of the intaking limb the flow is checked and air enters the discharging limb, and the syphon is vented, ready to start again as soon as the tank is filled.

When the tank discharges it flushes all parts of the closets liable to become foul, and at the same time raises the water which starts the syphon (Fig. 3) opposite end A in Figs. 1 or 2, which draws out all water contained in the closets. The secondary syphon or after flush refills the closets to the depth of 7 inches. This great depth of water forms a separate water seal between each seat, thus giving all the advantages of separate closets. There is a space of 2 feet between centers of each seat, and between each seat there



The Syphon "Eduction" Closets.—Fig. 1.—View of Closets and Supply Tank.

Fig. 2.—Plan of Closets.

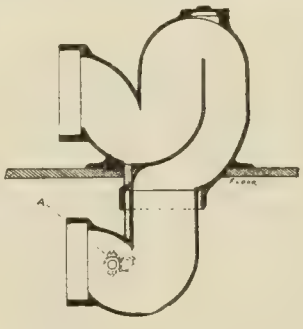


Fig. 3.—Syphon at End of Closets Opposite A, Fig. 1.

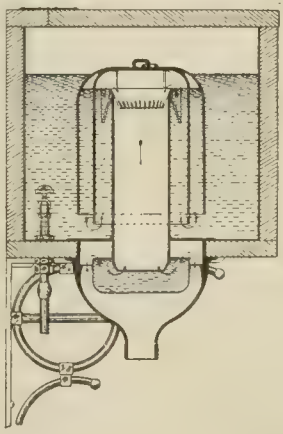

Fig. 4.—Section of Flush Tank Syphon.

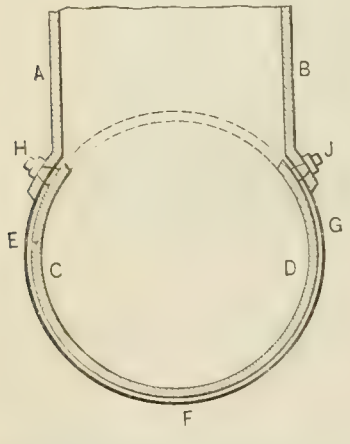
are lugs on which to bolt the wood partitions, leaving the space under the closets clear and easy of access for cleaning. Stop cock A, in Fig. 3, connects with lowest point of closets, and on being opened will drain the closets dry (the water supply being shut off), thus preventing freezing during cold nights or when the closets are not in use.

Connecting Saddle Hubs.

From P. D., *Newark, N. J.*—I would like to be informed through the columns of *The Metal Worker* of a convenient method for connecting saddle hubs to cast-iron soil pipe.

Answer.—When a saddle hub is to be connected to a cast-iron soil pipe the hub is laid on the pipe and the



Connecting Saddle Hubs.—Fig. 1.—*First Method.*

shape of opening to be cut in pipe marked; then holes are drilled near together inside of the mark so the piece can be broken out without danger to the pipe. After this opera-

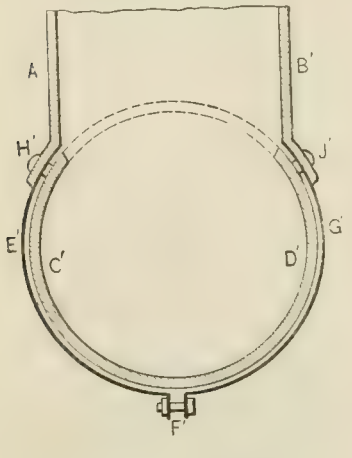


Fig. 2.—*Second Method.*

tion has been performed the edge of opening should be cut or filed so there will be no obstruction to the flow of soil through the connecting hub. In Fig. 1 A B represents the saddle hub and C D the soil pipe. Holes are drilled through the edges of hub for the reception of bolts, as shown at H and J. The iron strap E F G passes around the soil pipe, and is secured to the hub by the bolts H J, which pass through holes in the ends of strap. It is usual to cover the flange on saddle hub with putty before placing in position, when the nuts at H and J are screwed up tight, and, if the strap is of the proper length, should hold the hub firmly to the pipe.

Another method is shown in Fig. 2, in which two straps are used. These straps can be bolted or riveted to the hub at H' and J', and by having the ends bent over and holes made, the straps can be tightly drawn together by means of a bolt, as shown at F'. If it is not desired to use straps in the manner shown, by drilling holes through the edge of hub and soil pipe, then tapping the holes in pipe, the hub can be bolted on. When this method is used care should be taken that the bolts do not project into the soil pipe.

TRAPS AND VENTS.

AT A RECENT MEETING of the Board of Health of Binghamton, N. Y., Sanitary Inspector O. R. Mason was appointed Plumbing Inspector under the new law. They also authorized the City Attorney to bring suit against a citizen who had failed to put his property in proper sanitary condition.

THE HIGHGATE MUSEUM of Sanitary Appliances, in London, which was opened by the Lord Mayor of that city in December last, is said to be greatly appreciated by the public. During the eight months of its existence the Museum has been visited by 13,000 persons, an average of 64 visitors each day. This is the first museum of its kind in England, and the attendance shows that the London sanitary authorities succeeded in supplying a real need.

EX-ASSESSOR JOHN J. PURCELL, who obtained an average of 92 on a civil service examination, has been appointed Inspector of Plumbing at Troy, N. Y., at a salary of $1000 per year. This is in accordance with the plumbing regulations recently adopted under the new State law.

THE ANNUAL OUTING AND FISH DINNER of the master plumbers of Boston, Mass., was recently enjoyed at Bass Point, many novel contests enlivening the occasion.

THE BOARD OF HEALTH of Waltham, Mass., are perfecting plumbing regulations to be passed by the aldermen in compliance with the new statute law.

A NEW tinning, plumbing and gasfitting shop is being started at Nanticoke, Pa., by two young men, E. Morgan and John Griffiths.

JOHN TOWNSEND has moved from New Castle to Wilmington, Del., where he has engaged in the plumbing business.

THE WELL-KNOWN FIRM of plumbers, Byrne & Tucker, arranged to dissolve partnership on August 1, and the time since has been occupied in winding up their business. John Tucker is fitting up an office at 45 East Twentieth street, New York, and Thomas J. Byrne is arranging to do business at 377 Fourth avenue after the old stand has been closed.

THE BOARD OF HEALTH of Springfield, Mass., have appointed Frank W. Tower Inspector of Plumbing, he having secured an average of 94.5 in a civil service examination. Mr. Tower is a plumber of 21 years' experience, 16 of which have been spent in conducting a business for himself. He is arranging to sell out his business and his term of office will commence when this is effected. He has also been appointed one of the Board of Examiners, as the new law requires that one member must be an expert plumber. One of his important duties will be to aid in forming new regulations to be enacted as an ordinance to govern plumbing work.

PLUMBER MORAN of Jersey City, N. J., had a lot of block tin offered him at 11 cents a pound and made an engagement to meet the owner and haul it away, but in the meantime apprised the police of the affair, and a detective who went to help get the tin secured a crook and counterfeiter.

THE PLUMBERS of Los Angeles, Cal., appear to be acting in concert with those in New York City, so far as delay in getting their certificates is concerned. It appears that an ordinance was passed May 5 requiring the examination of plumbers, but up to August 15, we understand, there have been only three or four applicants. In a reported interview with Building Superintendent Eisen, it is stated that the master plumbers failing to get certificates from the board will, after September 1, be refused permits in his office, and all journeyman plumbers who do not hold certificates after the same date will be ineligible to work on any building.

THE PLUMBERS of Galveston, Texas, made elaborate preparations to receive their fellow craftsmen from Houston, who were to meet with them on August 19. One of the features of the day's amusements was to be a baseball game in the afternoon.

Apples for Iron.

Reaumer, the great French metallurgist, who was one of the pioneers of modern iron founding, thus describes some of the "tinker founders" of his day (1722–1757), who traveled with portable furnaces doing job founding on a primitive scale:

There are founders who do nothing every day but to melt cast iron and no other metal. Their number is not large, and I do not know whether there are more than one or two in Paris. These founders travel through the country and make their appearance gradually in different provinces. They make cast-iron weights, plates for different purposes, cast new, and patch old, hollow-ware. These founders buy the pig iron they want from peddlers, who gather cast-iron scrap in the villages in the vicinity of Paris. This scrap is exchanged for apples; a man with scales in one hand, leading a horse laden with poor fruit, does the business, exchanging apples for iron, weight for weight.

American lamps are rapidly taking the lead throughout the world. One of the largest exporters of these goods in the United States lately told the representative of a contemporary that the only competitor who now interferes with him is the German manufacturer. It appears that German lamps of the cheaper grades are lower in price than the American goods; but in the finer qualities of lamps the American manufacturer excels all his foreign rivals. His goods are more artistic and better in construction.

A large amount of real estate exchanged hands in Chicago last week in the course of settlement with creditors by Cudahy, Fairbank and other losers in the late provision collapse.

ROOFING AND CORNICE.

Painting Metal Roofs.

From A. A., *Brooklyn, N. Y.*—I wish to be informed regarding the painting of metal roofs. I once thought it a proper time to paint them with good linseed oil paint as soon as they were finished, but other people claim that the roofs should be a little rusty before applying the paint.

Answer.—The following article from the *Painter's Magazine* has a bearing upon the subject, and while it relates only to the painting of iron surfaces, will be of interest: "The point of prime importance is the actual condition of the surface when ready to receive the first coat. Upon this point rests the success or non-success of subsequent applications, for if not in proper condition no paint will prove permanently preservative. Now, the best state is that where there has been formed upon the surface of the iron a film of black oxide which has been, while hot, thoroughly permeated by and incorporated with a resinous or tarry covering. This covering insures perfect success, and its thickness may be increased from time to time by additional coats of paint. If, however, a layer of hydrated oxide (ordinary rust) be once allowed to form the successive coats of paint will fall off, their separation from the iron being merely a question of time. During the time, also, the rust has been spreading under the paint. An instance of this may be seen after outdoor work has been in place for some time. Usually all the riveting is done before the final painting is begun, each rivet head in the meantime being exposed to a damp atmosphere, the paint begins to peel off the rivet heads long before it leaves the adjacent plates, and when this occurs nothing but thorough scraping will give the paint a chance to adhere again. So slight are the differences of manipulation which determine whether a given piece of work shall or shall not rust away that they may all be found in the different methods pursued now and formerly. Taking the case of a piece of ornamental iron work, which in so many instances has come down to us in unimpaired beauty and condition, it would now probably be forged in detail in one part of a factory, drilled, filed and fitted in another, and when completely finished, be painted in three coats of best oil paint. Formerly the smith who forged the work punched the necessary holes at the same time, fitted his various pieces together as he went on, completing each piece as he proceeded, doing all the work with his hammer, and to quote an old work of directions to good smiths, brushing his work over with linseed oil and suspending it for some time over a strongly smoking wood fire. This will give at once a sort of elastic enamel coat, perfectly adherent and calculated to preserve the iron to the utmost. Of course iron work to-day is not made to undergo any such preparatory process, and the consequence is that we find it very difficult to produce good results in painting on iron surfaces."

From the above article we can infer that an iron surface should not be left exposed to the weather until rust has formed, as once started this action is liable to continue, even though paint has been applied. Regarding the time that should elapse (if any) after a tin roof is laid before it is painted, much would depend upon circumstances. If the tin is covered with palm oil to such an extent as to render the paint liable to peel off, the roof can be left exposed to the weather until the oil has been washed off. Some roofers recommend that as soon as the roof is finished the surface should be washed with benzine or an alkali, thus removing all traces of palm oil or other grease. Another method recommended is to sprinkle sand over the tin and then sweep it off with a broom. In localities where coal is largely used for fuel, or near the sea coast, the surface of tin exposed to the weather is soon corroded, and when the cheaper grades of roofing plates are used the surface soon becomes covered with rust. It must be evident that the better qualities of plates, or those having a heavy coating, would withstand the atmospheric effects for a longer time. It is conceded by most painters and roofers that the surface of a tin roof should be free from grease and rosin before painting, and, a clean surface being obtained, the sooner the paint is applied the better.

Regarding the kind of paint to be used on a roof, the following from *Painting and Painting Materials* may be found useful: "The value of a paint is its oil, and economy consists in purchasing good oil—the best and purest to be obtained. Adulterations should be advantageous in some cases, but it should be done for a purpose. On roofs, 15 to 20 per cent. of fish oil will be an advantage, and on bridges, which are not so frequently repainted, probably a little cotton-seed oil will do no injury. The principle of adulteration is very simple; the more 'elastic' the first coat the more durable, but the greater tendency to crack the second coat. The weather coat should always be the more 'elastic' (containing more non-drying oil); but a man of judgment will discriminate. The most elastic (in the true sense) of all oils is boiled oil; but it is too thick, and needs mixing with raw oil or with turpentine. A priming of such oil thoroughly dried will stick if red lead be added and not put on too thick. A little boiled thoroughly mixed with raw oil increases its elasticity, but probably increases the chances that the paint will wrinkle, pit and crawl a little; although if care be taken in the mixing and using any such effect should be so small as to be imperceptible. There is this strong reason for using more or less boiled oil—that the pigment, at least lead pigment, will more thoroughly unite with and harden the oil, as boiled oil is partly composed of free linseed-oil acid, and we shall thus get more hard soap. At the same time we thus get a harder oil. We always get with the boiled a certain quantity of oil rubber, produced by the boiling, and which, so long as it remains, gives the oil a rubber-like elasticity."

FLASHINGS.

CONTRACTS have been closed to build a sheet mill for the Los Angeles Iron & Steel Company of Los Angeles, Cal. The persons chiefly interested are J. G. Chamberlain, formerly of the Cherry Valley Iron Company, Leetonia, Ohio, and A. S. Robbins. Local scrap and imported billets are to be the raw materials.

THE BIRMINGHAM PAINT, OIL & ROOFING COMPANY, Birmingham, Ala., will make an addition to their works for grinding dry paints, utilizing ores from beds near Birmingham.

THE GLOBE VENTILATOR COMPANY, Troy, N. Y., have sold through L. H. Prentice & Co. of Chicago two 60-inch ventilators to the University of Chicago for use on the Ryerson Physical Laboratory.

THE accuracy of a quotation on sheets made in *The Metal Worker* August 5, has been questioned. Purchases at Ohio mills were made at that time at the following prices:

	Iron. Cents.	Steel. Cents.
64-100 to 71-100 pound per foot	2.65	2.75
72-100 to 87-100 pound per foot	2.55	2.65
88-100 to 125-100 pounds per foot	2.45	2.55
126-100 to 185-100 pounds per foot	2.35	2.45

The terms were 60 days' note or acceptance, or 2 per cent. discount for cash.

A noticeable outcome of the existing trade depression is the unusual increase in the number of steerage passengers booked this season from New York for European ports. The passenger traffic of this class is stated to be the heaviest on record.

STEAM AND HOT WATER.

Proportioning Hot-Air Pipes to Indirect Surface.

From D. M., *Bridgeport, Conn.*—Having occasion to bid on an indirect hot-water heating plant, which I lost, I give my experience in trying to find a rule for determining the size of flues to carry the warm air from the box coils to the registers. I went to two large cities where numerous manufacturers of hot-water apparatus had salesrooms, and I stopped in not less than 30 different places asking, after a preliminary chat, the question: "How many square inches of flue area should be allowed for each square foot of indirect hot-water surface?" As a result of my many queries I should adopt 1½ square inches of flue area for every foot of heating surface. If there were 50 square feet of heating surface I would make the flue 6 x 13 inches, or, if possible, 10 inches in diameter. The general idea for the cold-air supply was to make it 25 per cent. less in area than the heating flue. By some who answered my question I was told that ½ inch was enough, others said ¾, more said 1 inch, but the more experienced and reliable agreed on 1¼ and 1½ square inches, and I have since seen several jobs working very nicely on the 1½ inch basis, so I would not use a smaller proportion. I found a great many who did not favor indirect hot water for the entire job and were opposed to it on the first floor. They favored the fresh air which indirect heating furnished, and the use of some direct surface in the same rooms, but said that the great majority either could not stand the extra cost or simply would not.

English Practice in Hot-Water Heating—XXVI.*

IRREGULAR FORMS OF APPARATUS.

To carry the pipes of an apparatus in any way contrary to the principles laid down is, of course, never recommended, yet, at the same time, it is very commonly permissible if there is no possible means of doing otherwise. As an example, we can refer to the occasional practice of dipping a pipe in greenhouse work, if a doorway has to be passed. In the ordinary way, the pipes are carried around the house some 12 inches above the floor level, and to pass beneath a doorway opening means a dip in a pipe of at least this distance. This would be effected as in Fig. 107, but instead of carrying a pipe beneath the path tiles, a special pipe of square design can be obtained, and this would lay flush with the floor.

Now, a dip in a pipe creates an obstacle to the free circulation in a way that will be described directly, and considering the low speed of circulation or motive power that we get in horticultural works, it is very little indeed that we dare attempt in this direction. With building works the circumstances are different, for the speed at which the water moves is so much greater. It will be seen that with works extending up only 2 or 3 feet the circulation is sluggish enough to be an objection at all times if the services extend any distance and a fair degree of heat is required at the further extremities; and if we introduce anything to make the circulation still slower, trouble will most probably ensue, even supposing the dip does not entirely destroy efficiency.

According to the present accepted theory, the circulation of water in any apparatus depends upon the difference in weight of hot and cold water; the water in one pipe being heavier than the water in the other, and causing the latter to ascend. With an apparatus as Fig. 108, which we may suppose is a single pipe carried all the way round a house, we should have to pass a doorway somewhere, and the dip necessary to effect this is shown. (Let it be clearly understood that this is quite an imaginary arrangement, to illustrate the subject under discussion).

This apparatus can be carried, and would work in quite an ordinary manner to the point marked A, and so it would to C if it did not have to rise again; but from C to D the water is colder and heavier than it is between A and B, and consequently it would tend to bring about a retrograde movement—a movement in the contrary direction to what the water takes from the boiler to A. It is plain that the farther the water travels from the boiler the cooler it becomes, owing to its losing heat, as it is required to do; consequently the column of water C D must be colder than that from A to B, and its greater weight naturally opposes the movement of water in an upward direction. A very well-known writer upon heat, in dealing with the circulatory action of heated water, adopts an ingenious method of making the subject clear by spacing off the pipes in lengths of imaginary temperatures, as Figs. 109 and 110. By allowing a certain difference in weight to each space the theory can be very clearly dealt with.

With Fig. 109 we have a difference in mean temperature in the two columns of water of 33°. This may be called 33 grains (the actual difference is a greater weight than this), the water in the return pipe bringing about the circulation by it being thus much heavier than the water in the flow. By increasing or decreasing the hight of the pipes the motive power will be increased or decreased proportionately. If we plan an apparatus, as Fig. 110, and space it off, we find in theory that we get an equal weight in each pipe, and we may suppose that the water would fail to circulate either way. By the same reasoning

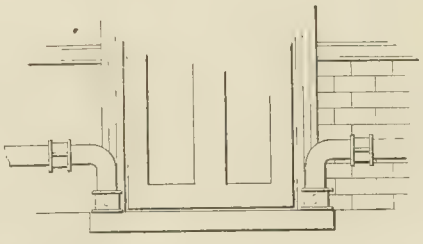

Fig. 107.—Showing Method of Running Pipe Across a Door Space.

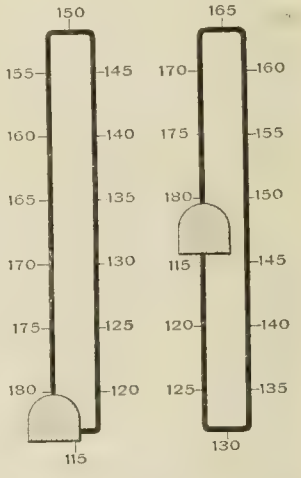

Figs. 109 and 110.—Pipe Spaced Off in Lengths of Imaginary Temperatures.

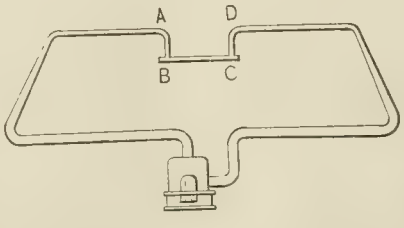

Fig. 108.—Pipe Carried from Boiler Round a House with "Dip" to Pass a Doorway.

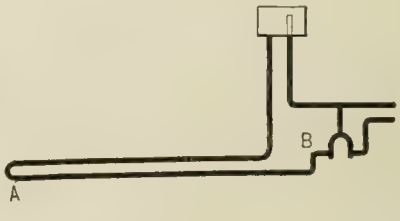

Fig. 111.—Showing an Arrangement of Pipes when Tank is Employed.

ENGLISH PRACTICE IN HOT-WATER HEATING.

* Reprinted from the *London Builder.*

we may expect a circulation more or less efficient by putting more pipe above the boiler than in the last cut, or, a reversed circulation if we carried the pipe further down below. This makes the theory plain, and in making dips in pipes it will be seen that, if of no great depth, they would prove no serious obstacle in building works, but in the average glass-house apparatus they are better avoided. As before mentioned, if, in these latter works, a dip did not actually stop the circulation, it would render the circulation more sluggish, and in long runs of pipe this is a great drawback.

Occasionally a boiler has to exist between two houses, which, being on rising ground, may bring one house a trifle lower than the boiler itself. This being the case, the more common plan adopted to permit of the pipes in this house being so low is to use a tank, as Fig. 111. The further use of the tank is to act as a feed cistern and air exit. The service from the right of the boiler is supposed to go to heat the house that is of sufficient hight; the service to the left is carried as shown, the flow to the tank by the most direct route, and the return acting as the radiating media. By thus circulating up to a higher point than usual we get a more efficient circulation, a higher motive power, which is always sufficient to make the apparatus work well if the rise of the return pipe to the boiler does not exceed, say, 18 inches. It will be understood that the tank shown is not absolutely necessary. If we carried pipe up to this hight with a feed cistern beside it, it would amount to the same thing, but would not have such a workmanlike appearance. The tank should have a cover to keep dirt from entering, as it fulfills the purposes of a supply cistern, as explained.

Occasionally, when a boiler is fixed somewhat centrally to the work, a tank is made use of, having a flow pipe to it from the boiler, but having several returns running in different directions. The flow would be carried to the tank by the most direct route, as just explained, the returns acting as the radiating pipes. It is said in favor of this plan that it allows of the freest possible escape of air, and it is further suggested by those who recommend the plan, that by the use of wooden plugs in the return pipes where they leave the tank, the need of stop cocks is dispensed with. Certainly by the use of a tank, placed in the highest position it can be, we get a better or stronger circulation, as will be understood.

The chief trouble experienced in works that depart from the regular form, is air dislodgment. It may appear an easy matter to many to get rid of air, that, it is admitted, does get in the pipes, and which must exist in the pipes before they are first charged, but every man with experience knows that air dislodgment partakes of the nature of a problem sometimes, and the solution is not discovered in a moment. In the illustration, Fig. 111, the return would descend to the point A, and then take an ascending direction all the way to the boiler, and, at first glance, there would be, apparently, no need for an air-pipe at all. This, however, is not the case, an air-pipe should be provided at B, not that there would be much use for it when the apparatus was once full and working well, but when charging the apparatus with water, there would be every probability of air being locked in the lower pipe between A and B, with ill results. In the same way an air vent would have to be provided both sides of the dip in Figs. 107 and 108. It has to be particularly remembered, also, that although an apparatus may perhaps be filled easily when first charging it, it does not follow that it can be filled as easily after it has had water once in it, for when emptying it will be practically impossible to get the water out of any dips there may be in the pipes, and these collecting points will prove obstacles to the free escape of air as the water is filled in again, unless, of course, air vents are provided.

This completes the papers upon "Warming Buildings by Hot Water," and our last suggestion to those who have the giving out of these works is to ascertain that the people intrusted with the work are capable and experienced; and, to those who execute the works, let it be an ambition to be master of the subject. This advice is, of course, good in all cases, but with hot-water works it is especially good, for it is really wonderful what perplexing difficulties a little want of knowledge may bring about, and what expense and trouble may be incurred in remedying such errors.

[THE END.]

HEATING NOTES.

ALBERT L. SNYDER, Topeka, Kan., is the patentee of an improvement in a hot water or steam heating apparatus. The special features aimed at in this heater is economy of heat and the use of soft coal. The heater consists of an upper dome and a lower annular water space forming the fire pot, connected to the upper dome by a series of vertical tubes. There is also another cylindrical water space around the combustion chamber between the dome and the lower water chamber. The dome is furthermore provided with drop tubes, increasing the heating surface. It is claimed for the heater that the arrangement of drafts is such that if any soot or dust accumulates it will be on the outside of the shell, where it can be easily removed.

THE FRIENDS of T. G. Haywood of the Denver house of the American Radiator Company will not be surprised to learn that his energy finds a wider scope for usefulness at the New York office.

THE LARGE PERCENTAGE of contracts awarded to the American Boiler Company, New York, from the number on which they have figured, they consider a compliment to their heating apparatus and system of installation.

AT THE CHICAGO MEETING of the Master Steam and Hot Water Fitters' Association the report presented by the Committee on Standard Flanges was adopted and the Executive Committee was instructed to circulate it among the manufacturers and the members of the association, with the request that the manufacturers adopt the standard submitted and that the steam fitters specify standard flanges in ordering goods. In pursuance of these instructions the Executive Committee issue in the form of a small pamphlet the report of the Committee on the Standardization of Flanges. It is a neat little publication containing the text, together with the illustrations accompanying the report.

BY MUTUAL AGREEMENT between the American Radiator Company and the Standard Radiator Company, the exclusive sale of the Standard Company's radiators through the American Radiator Company has been discontinued. The American Radiator Company, however, have a very large stock of Standard Company radiators and are prepared to supply the trade with the same.

EDWARD F. KEATING of 75 John street, New York, is issuing invitations to friends in the trade to inspect his new storerooms, machine shops and pipe warehouses at 187–189 and 452–454 Cherry street and 435–437 Water street on Tuesday, August 29, from noon till 5 p.m.

Electric Light and the Eyesight.

There are many people who regard the incandescent electric light as having an injurious effect on the eyesight. To these individuals the following consensus of opinions obtained by a leading electrical journal of London through a canvass of the principal oculists of that city should bear some weight in refutation of their unfavorable opinion of the latest illuminant. The journal in question recently published the following points as a *résumé* of the facts and opinions elicited from the specialists above referred to:

1. No authenticated case of injury to eyesight through the incandescent electric light has ever been recorded.
2. In point of purity, sufficiency, absence of heat, steadiness and adaptability, electric light is preferable to either gas, oil lamps or candles.
3. The only eyes which are likely to be injured by electric light are those already suffering from weakness or derangement, for which a dark room is necessary.
4. In less serious cases a change from gas to electric light has been found decidedly beneficial.
5. In its constitution electric light very closely resembles sunlight, and has a far smaller proportion of harmful rays than any of its rival illuminants.
6. The extreme ease with which it can be managed makes electric light capable of being perfectly shaded and placed.
7. Electric light under proper conditions of use is the best form of artificial lighting known.

Professor Semmola of Italy is reported to have used the electric battery with splendid success in cases of chronic lead poisoning. Based upon the well-known fact that electricity promotes assimilation, he used the battery and found that, under the influence of the current, the lead residue was thrown off and passed away with the secretions. At the end of three months nearly all his patients could be dismissed as cured.

Sharpers are now employing the aid of electricity in "sweating" gold coins. They can extract about 75 cents' worth of precious metal from each piece without altering its appearance.

Sawdust building bricks, a German invention, are thus described: The sawdust is dried and screened, to remove the coarser particles, and is then mixed with cement, lime and sand in the following proportions: One part cement, 2 parts lime, 5 parts sharp sand, and 2 parts sawdust. The sawdust is first mixed dry with the cement and sand. The final mixture is pressed into blocks, which are said to be cheap and useful. There is as much lime, and more than twice as much sand as sawdust in them.

World's Fair Exhibits.

WICKES REFRIGERATOR COMPANY of Chicago and New York exhibit specimens of special Refrigerator work of a high order. One is a tile-lined Refrigerator room, large enough for a man to enter to handle the contents. It is entirely lined with white tiles, has double glass windows in the door and the sides, and is furnished with capacious shelves of galvanized-iron. The ice chamber occupies one-third of the structure and is arranged to secure a thorough circulation of the air currents. An incandescent electric light illuminates the interior at night. Other Refrigerators shown are for the use of merchants desiring to exhibit perishable articles under glass, having double glass fronts with shelves back of them, while the ice chambers are in the rear. A grocer's large Refrigerator is fitted with glass shelves, wire-cloth shelves and wooden racks for special articles, drawers with wire-cloth bottoms and a large compartment the full size of the Refrigerator for hanging large pieces of meat. A family Ice Chest is made with an ice chamber in the center and provision chambers on both sides. A galvanized-iron box holds the ice in the ice chamber. This box can be drawn out horizontally on a jointed frame, having feet to rest on the floor, which are snugly folded up when not in use. This Refrigerator can consequently be made with a table top and used for other purposes, as all the openings are below in front.

D. R. SPERRY & Co. of Batavia, Ill., make a striking exhibit of their cast-iron wares in the Manufactures Building. They have erected a pavilion with columns composed of Drug Mortars, placed with tops and bottoms alternating; these columns are joined by a cast-iron frame work at the top, which supports a roof consisting of Farm Kettles, above which is a spire of Sugar Kettles, terminating in a finial of two Caldrons, the top one being inverted over the lower one, making a sphere. The top Caldron is gilded, while the lower one is embellished with representations of the firm's trade-mark. Kitchen utensils, such as Pots, Skillets, &c., are arranged under the pavilion. There are also steam jacket Kettles, the Rival Farm Boiler, Felloe Oilers and other articles made by the firm for use by farmers, dairymen, &c. The whole arrangement of this exhibit is highly ingenious and very creditable to the designer.

SMITH & ANTHONY STOVE COMPANY of Boston make a special exhibit of Whiteley's pattern seamless jacket Kettles, manufactured for the use of hotels, restaurants, public institutions, curriers, tanners, soap makers and others requiring steam jacket Kettles. The samples shown range from small ones holding 20 gallons to a huge Kettle with a holding capacity of 125 gallons. The company also make a half-jacket Kettle, which is lower priced and is equally strong but does not boil so quickly as the full jacket.

THE CLINTON WIRE CLOTH COMPANY of Clinton, Mass., make a notable exhibit of their products. Two sides of the space are inclosed by an ornamental brass railing, above which is the name of the company on a Wire sign. The other two sides are filled in with panels consisting of small frames covered with samples of the company's products, such as Wire Cloth, Poultry Netting, Perforated Metal, &c. All sizes of Mesh and a variety of Metals are used in the construction of these panels, which in themselves illustrate the comprehensive character of the line of goods made. The two entrances to the inclosure are flanked by great rolls of Wire Cloth, 72 inches wide, which stand up like huge pillars. Inside the floor space is well covered with rolls of "Silver Finish" Wire Cloth and Poultry Netting, in all widths, all sizes of mesh, different gauges of Wire, as also in various metals and different colors. Some are arranged on the floor and others on platforms to give variety to the exhibit. The Perforated Sheet Metal, also shown, is a conspicuous feature of the display, illustrating the capabilities of the company in this direction. Mounted in a fine oak frame, pivoted on a stand, is a specimen of plastering done on the Clinton Metal Furred Wire Lath. The mortar is so well keyed that the claim of the company appears substantiated that ceilings plastered on this Lath will never crack. The Wire Lath is made in a number of styles, comprising the Clinton double twist warp, Clinton stiffened, Clinton corrugated and Steven's rigid, plain, japanned or galvanized. It has been used in the construction of large buildings in all the leading cities of the country where fire proof partitions were desired. The exhibit is made in the Building of Manufactures and Liberal Arts.

The American Drummer.

The Kansas City *Star* has this to say about the American drummer:

The commercial traveler of the United States illustrates the growth and extension and improvement and elevation of the world and humanity. Genealogically he is descended from the bagman of the last century, who figures in so many good stories: he who first traveled on horseback selling goods by sample, as distinguished from the peddler who sold the articles themselves. The bagman, deriving his title from his saddlebags, represented the extension of commerce and the growth of manufactures. He effected the direct connection between the wholesaler and the retailer, between the port and the interior, between the centers of commerce and manufactures and the widespread country. He was the ambassador, the missionary, of trade. With the coming of railroads and steamboats the horseback traveler and his saddlebags gradually disappeared, and so the name bagman went out of use. The original labors of this disseminator of trade were greatly increased in this country, and from the fact that his business was to vigorously solicit business with an energy like that of the "alarming drum" came the appellation "drummer" still in use; but with the increasing magnitude and, as may be said, the increasing dignity of his operations came a yet more comprehensive designation, and the bagman of old became the commercial traveler of to day, as much greater than his commercial ancestor as a locomotive is in power than a horse, and as the colossal sample trunk of the nineteenth century is to the saddlebags of the eighteenth.

The commercial traveler, mustering by thousands, is now a great factor and feature in American business and social life. The drummers form a great society and they have divided and subdivided the land among them. Incessantly traveling, they have directly and indirectly regulated lines and facilities of travel. Every railroad line has felt their influence, and they have raised the hotel standard of the country. The commercial traveler, being an American citizen and usually a voter, is necessarily a politician, and if he does not control elections (and he has been known to do that), he becomes a good judge as to how the election is going. He moves about among the people and becomes a "people's man;" he is an authority on popular events and questions; he connects distant communities, facilitates the exchange of ideas, carries the news and fosters the brotherhood of man.

Zinc in Germany.

The following information regarding the production of zinc in Germany is given in *Kuhlow's Trade Review*:

Germany produces more zinc than any other country in the world; the exportation of zinc is, accordingly, very heavy, amounting to 58,000 tons, against an importation of not quite 9000 tons. The main zinc producing district is in Upper Silesia, where the metal is made from calamine, and also more and more from zinc-blende by distillation. The smelting of zinc-blende has led here, as in other places, to the establishment of very perfect arrangements for utilizing and preventing the deleterious effects of the sulphurous acid generated in the roasting of the ore.

In Germany in 1890 139,000 tons of zinc were smelted, in which work 9271 men were employed. The value of the output was 62,000,000 marks ($15,500,000 approximately), of which 64 per cent. were produced in Upper Silesia, 20 per cent. in the Arnsberg district, and the remainder in the Government districts of Dusseldorf and Aachen (Aix-la-Chapelle) and the kingdom of Saxony. The ore in the western parts of the country is, in the main, zinc blende.

The smelting of zinc is made very difficult in most localities by the presence of other metals in the ore. However, by a careful preparation of the ores and purification of the zinc obtained this difficulty has been overcome. By the use of regenerative gas heating furnaces and well-adapted condensers the cost of production has been reduced and loss of metal prevented. With the smelting of zinc a small production of cadmium is connected.

A Reverential Custom.

In seeking some information at a large fertilizing supply house, the question of bones came up through some fine specimens of antlers displayed in a glass case. It was learned that cargoes of bones were imported from many parts of the world, a shipload being then on the way from Egypt. On asking if human bones were ever found in the collection, an unwritten law was discovered that appears to be universally recognized and administered. In their daily contact in this business with bones of all sorts it is almost intuitively learned to what animal and what part a bone belongs, and when, as sometimes happens, a human bone forms part of the collection, it is instantly recognized and carefully laid aside. These human bones are invariably buried in a place that is less used than other parts of the grounds of the mill and are not unnecessarily disturbed.

The establishment of a Government dockyard is being considered in connection with the proposed improvement of the Mexican navy. The port of Guaymas is said to be its probable location. Vera Cruz is to have an arsenal and a floating dock. The latter is being built in France.

STOVE TRADE NOTES.

The Future of the Hot-Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

INTERESTING THE CONTRACTOR OR BUILDER.

In many places the carpenter combines in himself the profession of architect and builder, and not only furnishes the plans and specifications, but undertakes the entire contract for the structure, and hence is an important factor in discussing the furnace business. In fact, in most towns it would pay the furnaceman to keep on intimate terms with the personage referred to, and not allow an opportunity to pass of putting in a word in advocacy of the hot-air furnace. By instilling certain fundamental truths about hot-air heating into the mind of Mr. Builder he is gradually awakened to the importance of having improved heating in houses which he plans and erects, and he will soon be talking furnace to his clients, with the usual result, an increase in the furnace business.

It is through the country architect, contractor and builder (combined) that we must accomplish an object for which the furnaceman has long striven, and that is the incorporation into the plans and specifications of every house of adequate provisions for the heating, which shall include in the carpenter's contract the proper channels for the concealed pipes and also for the registers and boxes. The practical builder must surely see the necessity for this, as a much better and more economical building will result than if the channels are cut after all partitions have been set. I have spoken of this in another place, and have written various articles on the subject at different times with the hope that dealers would take up this matter with the architects and builders, and effect the much desired improvement, and have reason to believe that an improvement will result.

STOCK PLANS FOR HOUSES.

In conversation with contractors and builders I find that the great majority of them use stock plans for their houses, making such alterations as their customers may desire, and it has occurred to me that dealers could advance their interests by making estimates for builders of the cost of heating the most popular of these stock houses, which builders could have at their hands when talking to their clients. These estimates would be approximate, of course, but with a full line of furnaces, such as are now made by a number of concerns, the dealer could make his estimates elastic enough to cover both the cheaper and better grades of furnaces, with a variety of finishes in the registers and other materials used.

The average builder is a progressive fellow and does not wish to move along in the same groove year after year, and if his attention is directed to hot-air heating and its adaptability to the modern home or building I incline to think that he will show a disposition to investigate the subject closely, and dealers will do well to place all possible information in his hands and aid him to the best of their ability. Hot air is the heat for the average dwelling, store, church or schoolhouse, and the dealer should state this fact in no uncertain tones, and especially when the advocates of other forms of heating are pushing their wares so vigorously.

(*To be continued.*)

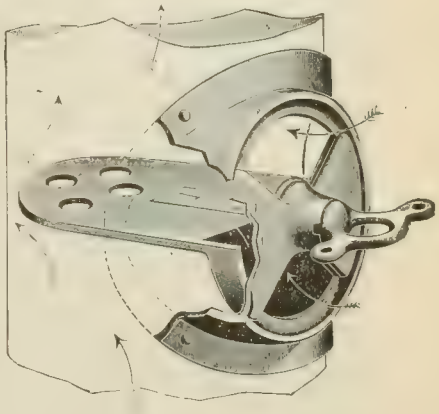
Tremont Stove Works.

The Anshutz-Bradberry Company, proprietors of the Tremont Stove Works, Allegheny, Pa., send us a copy of their catalogue and price-list which has just been issued from the press of Gies & Co. of Buffalo. The pamphlet is tastefully arranged and printed, being bound in flexible covers with side title in old gold. The corners of the pages are rounded and the edges finished in bright red, adding materially to the general effect. The goods shown cover an extensive assortment, into which the company have largely incorporated Bradberry's patent anti-clinker fire linings, for which strong claims are made. The leading place in the catalogue is given to the Perfect Tremont, a six-hole range, made in three sizes and a variety of styles. Among its constructive features may be mentioned large sheet steel bailed ash pan, patent cut long center, basket or shaking grate, patent oven-door opener, ventilated oven and nickel trimmings. This stove is followed by the Tremont steel-plate range, which has asbestos-lined flues, asbestos double bottom, double oven doors and warming closet. The leading cook stove is known under the name Tremont and is offered in three sizes. The Yantic and New Yantic are also members of this general class. The heaters occupy a number of pages and are represented by the Tremont, a new parlor stove of the Franklin type, made in two sizes. The Electric Tremont is another novelty in the way of open-front stoves, having sliding upper mica doors, round fire pot and draw-center shaking grate. The Tremont cottage parlor, the Menlo cannon, the Ionia, a recent addition to this class, together with a miscellaneous assortment of goods of cheaper construction, complete the list. A number of pages are given up to furnaces, school-house heaters, summer stoves for using natural gas as a fuel, hollow ware price lists, fenders, stove trucks, tables of warm-air registers and ventilators, as well as those giving the weight of the principal parts used for repairs. Another feature of the catalogue is a corrected list of stoves manufactured in Pittsburgh.

The Olive Stove Works of Rochester, Pa., have been closed for several weeks past for the purpose of making necessary repairs. Among the work which has been under way is a new roof, now being rapidly completed. It is expected that the works will resume operations within a few days.

An Improved Damper.

We show in the accompanying illustration a broken view of an improved form of damper, lately patented and put on the market by Uzal Cory & Co., 210 Water street, New York. The device is adapted for stove or furnace or other flues, the special feature being that it provides for the ventilation of the room and at the same time obviates the danger of gas escaping from the pipe into the apartment ventilated. Referring to the illustration, it will be seen to consist of a revolving face plate and a casing or setting that conforms to the cylindrical shape of the pipe, so that it can be riveted tight to the smoke flue when set in place. The damper disk, as shown in the illustration, is connected with a handle and is perforated to allow the slow passage of the products of combustion when it is closed. The special feature, however, is the arrangement of the ports. Ordinarily, where the revolution of the damper opens ports above and below the damper disk, there is opportunity for the gases to enter the room from below the damper plate, coming out through the lower port. In this improved form of damper, however, a passageway is formed back of the port to above the damper plate, so that air entering from the room through the lower port is conducted above the damper, and, although the gases below the damper may be under slight pressure when the latter is closed, there is no opportunity afforded for their escape into the room. This passageway leading above the damper, which is in the form of a hood, is mounted on the damper disk.



Broken View of Improved Damper.

Chinese Cook Stoves.

Some interesting information about the cooking utensils and cook stoves used by the Chinese is given by a writer in *Food*. A well-appointed Chinese kitchen differs from an American kitchen of the same grade, first in being much cleaner, and secondly in being better provided with apparatus and utensils. Moreover, the utensils are better made. Every vessel in which food is cooked is a segment of a sphere.

There are no angles or corners in which grease or dirt can gather. Neither are there shelves and boxes in the kitchen where the smaller tools may be put away. Everything is hung up, and a single glance around shows the spotless cleanliness. The Chinese boil food by the use of superheated steam, which gives better results than boiling in water. Another feature is the stove, in which fuel is used with lavish disregard of its cost. The stoves are peculiar to our eyes, for the fire is built outside of them as often as inside, the heat being drawn directly from the flame, through what we would call the oven, to the flue. This gives a smoky flavor to the meats which are roasted in the oven, and the smoky flavor is accounted good, while the oils of the smoke tend to preserve the meats.

Shelving and Numbering Repairs.

A friend in the trade recently wrote us for the best plan for shelving and numbering repairs, and while it may be an open question as to which of the many schemes adopted by the many manufacturers and dealers is the best, we describe a plan furnished by a manufacturer, which may be considered worthy of imitation by those whose present method is not so practicable. Our correspondent says:

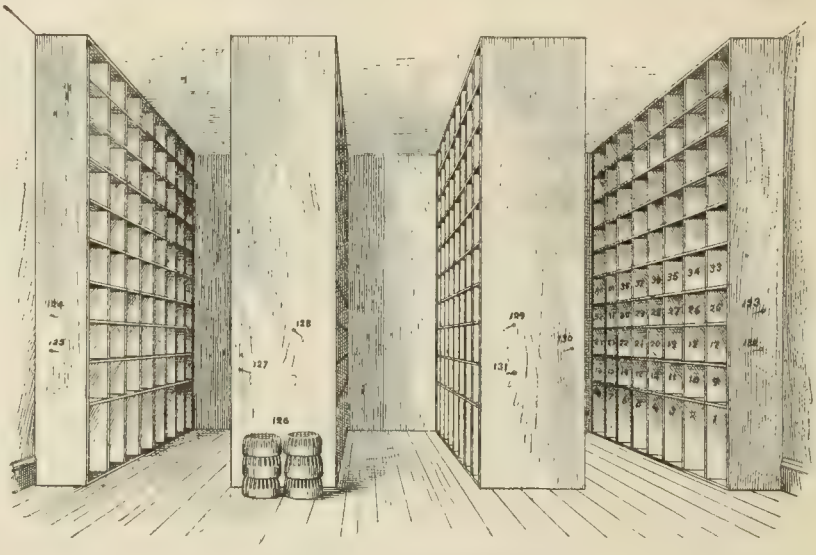
From the slovenly manner in which repairs are often kept by some dealers I should judge it to be a part of the stove business which is considered of secondary importance by most people, for little time and money are spent in the construction of suitable shelving or in the observance of a good system for keeping track of stocks on hand. There are, in fact, a thousand and one different ways of keeping repairs, according to the volume of business done in them. In many house-furnishing goods and hardware stores space is left on the floor under all platforms and shelving in which to poke repairs, and, while this plan may be the most economical so far as room is concerned, especially where it is limited and the business in repairs small, it cannot be recommended as desirable on any other grounds, as the repairs cannot be readily seen and it is back-breaking work to get at them. Some houses have all such repair pieces as will pile up placed about on the basement floor. They stack them in rows, with aisles between, and odd-shaped pieces they keep on shelves; but this simple method is not worth imitating by anybody who desires a good system in all departments of his business and is disposed to confine all his merchandise to the smallest space consistent with convenience in handling. But small dealers generally will naturally be apt to improvise means for taking care of repairs acording to the quantity they handle, their importance and the size of their store; that is to say, they put up shelves in their store in recesses or corners or in any space that cannot be advantageously devoted to the display or storage of more valuable merchandise. The plan I present here is intended more for larger dealers and jobbers and manufacturers, who carry anywhere from 50 to 100 tons of repairs and are obliged to devote entire lofts or basements to that department.

BINS FOR REPAIRS.

It is first necessary to build the bins, and it is perhaps needless to go into detail as to their construction, except to say that the boards used should be good and heavy; made out of 1¼-inch plank. Nearly all might be made of one size, say 16 inches high, about 16 inches wide and 21 inches deep, inside measurement, and a few cross partitions put in afterward for smaller bins to accommodate smaller articles, and inserted in such places as may be handiest, according to the quickness or slowness of sales of such articles. The first tier of shelves should start about 2 feet from the floor, leaving high bins at the bottom to pile up range bricks or to put tops, bottoms, backs and fronts, which would require larger space than grates, &c. In the basement or loft of any ordinary building 25 feet wide, bins 21 inches deep can be constructed on each side wall, and two sets of bins of double that depth in the center, with aisles between of ample width to swing a hand truck.

After providing all the bins, they should be numbered, and also a number given to any open space; any passageways or corners of the apartment, in which fire pots or extra large and heavy pieces may be kept, which on account of their weight and size, cannot be cared for in bins.

Every dealer must make his own "layout;" that is to say, decide what bins will be the handiest for the repairs most often called for.



Shelving for Stove Repairs.

INDEX BOOK.

Before piling them away he should provide himself with a well-bound index book of about 200 pages, ruled to give about 40 horizontal lines on each page, and about 12 columns for sizes, and a margin at the left for name of pieces, as follows:

Name of stove.

Name of repair parts.	Numbers or sizes of stoves.												Numbers of bins or corners or places where repairs are kept.
	6	7	8	9									
Grate, bottom.													
Grate, front.													
Grate rest.													
Bricks.													
Top.													
Bottom.													
Back.													
Front.													
Covers.													
Cross piece, long.													
Cross piece, short.													
Pipe collar.													
Top oven.													
Bottom oven.													
Fire oven.													

Then as the repairs are put away insert in book on the proper page containing the name of the stove, and opposite the name of the piece and under the number indicating size, the number of the bin where the piece was put.

It will probably be found that 40 horizontal lines will be all that are required for the pieces of any stove or range, and, of course, a good many

plain constructions will require the writing in the names of but a very few pieces, as well as some old stoves, of which only a few parts for repair are kept in stock.

So far as the vertical columns are concerned, there are no cooking constructions made under a certain name of as many sizes as there are columns, and that number of columns will also be found sufficient for any heating stove, even with the varieties of tea-kettle attachment and revertible flue.

The only labor connected with the plan is at the start. As each new stove makes its appearance or new repairs are kept, it is but little trouble to write the names of the pieces in the book, and insert the numbers of the bins where the pieces are kept and the reference is made. It is, of course, necessary to give a number to every place, shelf, corner or hook where anything is kept. If turnbuckles or small lugs or draft slides are kept on wires or hung up, for instance, in the passageways between the sections of bins, on nails driven in the boards forming the abutment of the section, the spot where they hang should be numbered. Fire pots piled up against a wall should have a number.

If this plan is followed thoroughly at the start and kept up when new goods are added, anybody around the establishment can find a casting wanted without being entirely dependent upon the repair man. There is no doubt that many large concerns have been bothered when they have lost the services of the repair man, who may be the only person around who knows where to get certain repairs, and there is no good reason why any well-regulated concern should not have as good a system in this department of the business, and one to give the least bother when clerks are changed, as in any other.

Electric Cooking.

In a paper on "Electric Heating," read before the Chicago Electric Club Carl K. MacFadden made the following remarks on the application of electricity to cooking purposes:

Since electric heating has been taken up so successfully on electric roads, the fact also presents itself that there would be a large field in cooking devices to be operated by currents of standard voltages to-day used in lighting. A few electric stove companies have at present good lines of cooking utensils which surely fill every want for reliability, cleanliness and good design. There are many cases, especially in the smaller sized cooking utensils, where electricity can compete with coal. A small tea kettle, taking 250 watts of current, will furnish boiling water in a few moments by the simple turning of a switch. An "afternoon tea" can be given, the cost of current being but a few cents. There would be no need of fires being lighted with the necessary dirt and attention, but the cooking utensils could be placed, you might say, on the parlor table, with no visible connection to a source of heat with the exception of a silk-covered conducting cord. The use of electricity in the kitchen reduces the art of cooking to a science. It is an easy matter to determine just how many minutes it will take to cook a certain dish with a current of a certain predetermined strength. This method leaves nothing to be guessed at, and, of course, the current may be cut off and all expense stopped the instant that the cooking is completed. With coal stoves this is an impossibility, and fires have to be started long before you are ready to use them, and the waste of fuel goes on even after the work is done. It would be a pleasant thought winter mornings for the lazy man to know that his kitchen fire was a thing of the past, and that the fire that would cook his morning meal had been started long before in the power house; that it was only a question of throwing a switch and waiting a minute or so for his electric culinary apparatus to be in condition for cooking. As to the exact pecuniary value of his comfort thus obtained, that is, of course, mere conjecture, and would have to be answered by the man in question.

There are, of course, a vast number of plants throughout the country that will not furnish current at a rate which would allow electric cooking apparatus to be used, provided it was simply a question of coal costing so many cents per hour and electricity a few cents more.

ODD PLATES.

The Ridgway Furnace Company, 76 Union street, Boston, Mass., have had gratifying success with their 1893 furnace, sales for the first half of the year showing a gain of two-thirds.

Spite of "financial stringency," "trade depression," "scarcity of currency" and other favorite terms which are becoming familiar to our ears as household words in the daily reports of the business situation, Sam S. Utter says this has been the best year for gas and oil stoves that he has seen yet. Business has been booming with him up till quite lately, and though a trifle dull just now, there is a prospect of lots more of it ahead. Sam is now engaged in perfecting a new parlor oil stove, which he thinks will beat all former efforts. We shall hear more of this anon.

F. M. Borden of Philadelphia has left stoves and stove repairs behind and is enjoying the sights at the White City in company with his wife.

An oil heating stove in which the parts are so arranged that the air is fed through the burner and made to rise through a vertical tube in a heated condition has been patented by Carl Brandt of Cedar Falls, Iowa. The arrangement is such that the air is fed downwardly through a spiral coil outside of the vertical tube to the exterior of the stove at one side, while at the same time an inflowing current of air from the bottom of the stove moves upward through and around the said parts and out at the top in such a way as to quickly warm the room and equalize the temperature.

The Foster Stove Works of Ironton, Iowa, resumed operations week before last, after the usual shut down for repairs, alterations, &c.

J. E. Frenning of S. M. Howes Company, 40 to 46 Union street, Boston, Mass., has gone to Maine for his annual vacation.

The Turner Zephyr Stove Company of Indianapolis, Ind., have been organized with a capital stock of $20,000. The directors are A. F. Kleinschmidt, William Henry Turner and William Hyde Turner.

Pursuant to an order of the Supreme Court John Gutmann, receiver of the Albany Stove Company, Albany, N. Y., offered for sale, at noon on Tuesday, August 15, the real estate, buildings, machinery, tools, implements, &c., excepting the manufactured stoves, castings, office furniture and nickel plant of the company. The receiver announced that there was a mortgage of $10,000 given to secure payment of notes, and that the terms of the sale were 10 per cent. down and the balance within ten days. There were but few persons present at the sale, and as no one made a bid the receiver, after consulting with his attorney, announced the sale postponed.

We are indebted to John Hobrecker, Jr., Omaha, Neb., for a copy of a 120 page catalogue which he has issued, showing some of the leading lines of stoves, ranges and heaters which he handles as agent. The list includes goods made by the March-Brownback Stove Company, Pottstown, Pa.; Duffy-Trowbridge Stove Company, Hannibal, Mo.; N. G. Galusha, Rochester, N. Y.; Cleveland Steel Range Company, Cleveland, Ohio; Leibrandt & McDowell Stove Company, Philadelphia, Pa., and the Joseph Bell Stove Company, Muncie, Ind. In the announcement to the trade it is stated that in 1889 Mr. Hobrecker started business in a room 20 x 35 feet, since which time trade has increased to such an extent as to necessitate removals and enlargements, until at present he occupies nearly all of the commodious building at 1007–1011 Jones street and represents nine large manufacturers, six of whom produce complete lines of cast or steel goods. As it is impossible to carry in stock full lines of all the goods manufactured, those sizes which it is necessary to ship from the factory on special order are indicated in the catalogue by a star. Mr. Hobrecker is also Western agent for a line of vapor goods and carries in stock a full assortment of hollow ware, refrigerators, stove boards, coal hods, shovels, repairs, &c.

On the 20th inst. the Quick Meal Stove Company of St. Louis laid the corner stone of their new manufactory, which will adjoin the present plant on Chateau avenue. The ceremonies were brief. The daughters of President C. A. Stockstrom and Secretary Louis Stockstrom performed the ceremony of laying the corner stone A tin box containing the usual articles employed on such occasions, copies of the St. Louis papers, coins, &c., was deposited by the two young ladies, and the following day the work of erection was practically begun. The building will be a four story structure 59 x 140 feet, and will be built on the latest slow combustion principle. The present season has taxed their works to the full capacity, and it is expected that the addition referred to will enable them to keep abreast with their orders next season better than they have been able to do during the past three months. Notwithstanding the general business depression throughout the country, this concern are in receipt of carload orders, which, as most manufacturing establishments are aware, are very scarce these days. Their sales during the present season, will, it is expected, show an increase of something like 30 per cent. over last year's trade.

The Dangler Stove & Mfg. Company of Cleveland, Ohio, are the assignees of a patent granted to Henry Ruppel for burners intended for use in connection with gasoline or vapor stoves. The burners are constructed with a series of perforated and non-perforated chimneys, so arranged in

connection with a hood and center funnel-shaped cap that the heat is concentrated toward the center of the burner, thereby creating, it is claimed, an intense heat, which is spread by means of the cooking utensils being placed above and over it.

According to a recent issue of the Louisville *Times* the foundry of the Bridgeford Stove Company of Louisville, Ky., has ceased operations for the present in order to make necessary repairs. It is stated, however, that the suspension of operations this year will be for a longer period than usual, owing to the depression in business and the fact that the company have a large stock of goods on hand. The paper named is authority for the statement that the officers of the company have not yet decided when oprations will be resumed, but intimate that they are not likely to until some of the stock has been worked off.

In the issue of the Detroit *Evening News* of August 16 appeared an interview with George H. Barbour of the Michigan Stove Company relative to the financial situation and the condition of affairs at the company's works. Among other things he is reported to have said: "At present we are running three days in the week with the mounting department, the other departments running light. Early next week we hope to find the financial condition in such shape that we can resume in full All is looking very favorable at present to that end. Our idea is to keep our men at work, and we are willing to take a share of the risk ourselves. The main point in the financial condition here is to have the savings bank depositors regain confidence and not draw out any more than the necessities of the case require. That confidence being restored and the banks relieved, the money will get into circulation and business will be promptly resumed."

The Littlefield Stove Company of Albany, N. Y., have issued an advertising novelty in the shape of a memorandum book of a size and shape convenient to be carried in the vest pocket. The covers are devoted to an illustration and a statement relative to the four important features embodied in the construction of the West Shore range. There is also given a calendar for the year 1893 and some remarks relative to the s ove named.

The Joliet Stove Works of Joliet, Ill., send us copies of circulars which they are mailing to the trade. One re lates to Moore's Fidelity range, which is made in 18 styles and sizes, and adapted for soft coal or wood. It has a large square oven, ample fire box, fit ted with the company's new automatic ally working soft coal grate and large plain draw hearth, under which is a capacious ash pan. The flues are roomy and especially adapted for soft coal. The ornamentation of this stove is of a striking character, the oven door carrying a handsome carved nickeled plate with tile ornament, while the door over the hearth is embellished with nickel in a pleasing manner. The second circular before us illustrates and describes Moore's Air Tight heater, a parlor stove of graceful proportions and rich and effective ornamentation. The construction and design are fully covered by letters patent, and the stove is referred to as being economical in the use of fuel, satisfactory in operation and may be run red hot without injury. Every stove has a double heating attachment, so that more than one apartment may be heated if desired. H. Leonard & Sons of Grand Rapids, have been appointed State agents for the sale of the company's goods in Michigan, while Baker & Myers of Cleveland have been appointed State agents for Ohio.

The Edwards Parlor Lamp Stove Company, 9 and 11 North Canal street, Chicago, Ill., are sending out a very neat circular or folder relating to their goods. The lamp stove is such that it can be used as a heater or, by removing the dome top, it can be employed for cooking purposes. It is made in two sizes, is finished in nickel plate, highly polished, and is claimed to operate without odor, smoke or soot.

J. H. Osmond of 156 North Seventh street, Philadelphia, Pa., sends us a circular of the Rival Portable furnace, patented in 1875 and improved last year. The heavy wrought iron radiator is so constructed that the heated gases are thrown against the outside and top and then pass down one drum and up the other before escaping to the smoke pipe. The fire pot is heavy, the grate is of the shaking and dumping type, operated by an upright lever, and the base is open all around for the admission of cold air. The water pan is at the back where a large manhole door allows the examination of the interior parts and permits the drum to be taken out and new ones put in without dismounting the furnace. The manufacturer states that the construction of the heater is such that before escaping into the chimney the products of combustion are retained within the furnace until their heat has been fully utilized.

The Danville Stove & Mfg. Company, with works at Danville, Pa., and branch houses in Chicago, Baltimore and New York City, are sending out a little pamphlet in which is illustrated and fully described the Beaver steel plate furnace. Special reference is made to the ash pit, the triplex grate, the fire pot, the dome, the double steel cylinder radiator, dust flue, check damper, feed doors, &c. Several reasons are given why the Beaver is the best, and directions are presented for operating and setting the heaters which are made under this name. Various tables relating to pipes, registers, &c., constitute valuable features of the pamphlet.

Graff & Co , 208 Water street, New York, who shut down their foundries July 1, as customary at that season of the year, for repairs, found they had a large stock of goods on hand. Since that time they have worked off most of it and were obliged to start up again August 21. Their experience has been that up to July 1 their trade was fully as good as usual and better than for the corresponding period of the preceding year. They say now the demand is as good as a year ago, although such as relates to building operations is behind in volume.

The Schneider & Trenkamp Company of Cleveland, Ohio, favor us with a copy of an illustrated catalogue of Reliable gas heaters, parlor grates and radiators. The pamphlet is made up of 40 pages of letterpress, bound in covers of deep blue with side title in old gold. The fourth page of the cover is embellished with a bird's eye view of the company's works at Cleveland. The first thing to which the attention of the reader is invited is a short chapter on gas fires and stoves, in which are presented some remarks by Dr. B. W. Richardson. Following this are general directions for operating and caring for Reliable heaters, after which are given numerous illustrations of the goods. The heaters are made in different sizes to meet varying requirements and range in size from those measuring 6 inches in diameter up to those of 12 inches. A telegraphic code for ordering goods by wire is a feature of the closing pages of the pamphlet.

For his five years' drift across the Arctic regions Dr. Nansen takes with him an oil stove which, at a cost of four cents, will, it is said, cook as large a dinner as any party of 20 could eat.

Novel Diseases

Modern facilities for rapid locomotion appear to be bringing in their train a whole string of brand new diseases which were unknown to the medical faculty a few years ago. One of these, the *kyphosis bicyclistarum*, or "bicyclist's stoop," is now a well-defined malady which has taken its place permanently in pathology. The cable car is reported to be responsible for another and entirely novel disease, from which a conductor in Philadelphia is now suffering. This is known as *cellular opestacitis*, or "bell arm." The man's case, as described in a Quaker City journal from the records of the hospital where he is being treated, is a curious one. He is a conductor on the foremost car of a train of three, and the habitual custom of listening for the sharp "ting ting" of the bell on the rear car, followed by the mechanical movement of the arm toward his own bell strap, has developed this strange ailment. This muscular movement has become a second nature to him, and his arm actually acts more quickly than his brain. To such an extent has this involuntary action gone that whenever he hears a bell of any kind his arm at once shoots upward toward an imaginary bell cord. The physicians at the hospital were greatly puzzled to account for this at first, but the case has finally been diagnosed as one of *cellular opestacitis*.

A third disease developed of late years, which is attributable to modern causes, is the "tennis shoulder," from which the devotees of that game are often found to suffer. There is much truth in the opinion of a distinguished surgeon that the conditions of our present high civilization are directly responsible for the majority of ailments that modern flesh is heir to.

The cyclonic storm that swept over the State of New York and other parts of the Atlantic coast on Wednesday and Thursday seriously injured the apple and corn crops. Short supplies for canners will, it is feared be the result.

A St. Louis dispatch of August 24 reports the destruction by fire of the entire plant of the Western Brass Mfg. Company of that city. The loss is estimated at $165,000, about three-fourths of which is covered by insurance.

Telephone messages have been successfully transmitted over wire fences in Australia.

THE RETAIL STORE.

Retail Dealers' Protective Association.

The following call for a meeting of the retail Hardware dealers of the United States to discuss the advisability of forming a National Protective Association and other matters of interest to the trade has been issued by S. S. Bryan, secretary of the Pennsylvania Retail Hardware Dealers' Association:

To the Retail Hardware Trade of the United States:

Feeling that the time has arrived when some action is necessary to protect ourselves as retail dealers in Hardware from the inroads which manufacturers and jobbers are making on our trade, we invite you to be present at a meeting of the Retail Hardware Dealers of the United States, to be held in Chicago, Wednesday, September 20, 1893, the exact place to be hereafter named. At this meeting will be discussed the advisability of forming a protective association, and other matters of interest to the trade.

The attendance at this meeting will in no way commit you to join if you do not see proper.

ORR & LOCKETT HARDWARE COMPANY, Chicago, Ill.
BULLARD & GORMLEY, Chicago, Ill.
HODGE & HOMER, Chicago, Ill.
S. J. STEBBINS, Chicago, Ill.
DAVIS, HUNT & CO., Cleveland, Ohio.
NORTHWESTERN HARDWARE COMPANY, St. Paul, Minn.
W. K. MORISON & CO., Minneapolis, Minn.
STEBBINS & CO., Rochester, Minn.
MOUND CITY HARDWARE COMPANY, St. Louis, Mo.
IRVING A. SIBLEY, South Bend, Ind.
SPRINGFIELD HARDWARE COMPANY, Springfield, Ohio.
TALLMADGE HARDWARE COMPANY, Columbus, Ohio.
J. B. KAERCHER, Pittsburgh, Pa.
SAMUEL MCKNIGHT, Allegheny, Pa.
STEINER & VOEGHTLY, Allegheny, Pa.
A. B. NEYHART, Williamsport, Pa.
J. P. FRAZIER, Franklin, Pa.
C. J. KIRK, New Castle, Pa.
H. W. PICKETT, Warren, Pa.
M. H. CLARK, Jamestown, N. Y.
D. C. WELLER, Erie, Pa.
D. ARTHUR GILL, Meadville, Pa.
JOHN S. LESLIE, Sharon, Pa.
R. L. KERNOCHAN, Titusville, Pa.
S. S. BRYAN, Titusville, Pa.

It is desired to have as large a representation as possible. It is especially requested that all who expect to attend will notify at once Wm. T. Humes, care Orr & Lockett Hardware Company, Chicago, Ill., in order that proper arrangements can be made for the meeting.

If for any reason you are prevented from attending, please send in your name for enrollment should it be deemed wise to organize. This will be a great assistance to those having the matter in charge.

JOHN Y. COOPER, 709 South Cherry street, Nashville, Tenn., writes us that he expects to engage in the business of repairing and fitting up stoves at an early date, and wishes to hear from manufacturers of stove pipe blanks, asking that they mail him circulars illustrating and describing their patents, with net prices.

Alaska Stove-Lid Lifter.

Troy Nickel Works, Troy, N. Y., are putting a new style of lifter on the market, as illustrated herewith. In construction the lifter is similar to others of their make, having a spiral wire handle, with a ring upon the end for hanging it up. The manufacturers claim for the lifter durability, fine finish and that it is always cold.

Alaska Stove-Lid Lifter.

MERIDEN BRONZE COMPANY have now on exhibition at their New York showrooms, 30 Park place, a handsome line of various kinds of Lamps, many of which have been prepared for this season's business. They are of medium and higher grades, suitable for fine trade. A good assortment of Vases has been imported for use as standards in Lamp mounting, and are now ready. The Lamps have been made up in numerous finishes and designs, those in gold and silver plate predominating, with many trimmed with onyx. A generous supply of art goods, including onyx and gold Tables, &c., can also be seen.

No. 0 Square-Lift Fire Department Lantern.

R. E. Dietz Company, 60 Laight street, New York, and 25 Lake street, Chicago, are putting the above lantern on the market, as illustrated herewith. It is made of brass in a substantial manner, particularly adapted to the use of fire departments. The lantern has a square-lift movement, and a conveniently shaped brass handle. A feature of the lantern is a wind-brake guard, represented in the cut by the band located near the top of the chimney. The band is attached to the side strips to which the wire guards are fastened. These strips, with wind brake and wires attached, slide on the upright square tubes, the whole being held in place by a spring push connected with one of the square tubes. This permits the chimney to be removed for cleaning, &c. In this connection the manufacturers state that they continue making their all-tin fire department lantern; also the tin one with copper oil pot, for fire department use.

No. 0 Square-Lift Fire Department Lantern.

A Brooklyn citizen is said to have dispensed entirely with coal in his house, and all his household operations are now performed by electricity. The house is lighted by electricity; and the cooking is done and all water heated by electricity; in summer the house is cooled by electric fans; in winter it is warmed by electric heaters. The work of ironing is done by electric irons, and whenever power is needed electric motors are employed, as for running a sewing machine, or in laundry operations.

A technical school is to be established at Osaka, in Japan, for the training of youths in various handicrafts.

TRADE REPORT.

The Iron Market.

In the Iron trade the general impression is that we must face a protracted period of low prices and only slowly expanding volume of business. The fact that a number of important plants are being operated by receivers in itself is regarded as likely to have an adverse effect. There is a growing feeling that the system is unjust to solvent concerns, since the competition is unfair.

Another factor which is pointed out as likely to hold down values is that mill after mill will make special efforts, as a preliminary to resumption, to secure good "backbone" orders, which are usually relied upon to secure at least partial employment for a series of months. This is particularly true where specifications must first be received before operations can begin.

In staple articles, distributed widely and in small quantities, where, therefore, stocks play an important part, the reserves of this character have been drawn down to a very low point. It is in these lines that the necessities of consumers are even now being felt and in which an upward tendency may be first expected to develop.

The outlook for raw materials like Ore and Coke looks gloomy, because in them the unprecedented dullness in the Rail trade, with its important tonnage, tells most.

Pig Iron.—In the New York market practically those who must sell in order to meet engagements are in control. Some very low offers have been made by Southern furnaces, and have to some extent been followed by Northern makers. It is hinted that those in control of the management of some of the Standard Eastern Pennsylvania makes are considering the question of lowering prices. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $13 for No. 1 Soft.

The movement of Pig Iron is reported as extremely light in the Philadelphia district, and while quotations are nominally unchanged, there is no difficulty in securing special rates for special terms. That is to say, cash or short-time buyers can shade prices 25¢ to 50¢ ℔ ton; but on ordinary time sales quotations are pretty well maintained. Sales are all in small lots, there being no disposition to buy in advance of requirements and no possibility of marketing large lots unless on terms which holders are not willing to accept. Ordinary time sales are usually at about $13 @ $13.50, delivered, for Plain No. 2, $13.75 @ $14.25 for No. 2x and $14.50 @ $15 for No. 1x.

Production of Pig Iron in the Pittsburgh district has been further lessened by the banking down of other stacks. A very small amount of Iron is selling, but with increased activity among some of the mills it is thought demand will show a great improvement before a great while. Meanwhile, quotations are given as follows:

No. 1 Foundry	$13.00 @	$13.25	cash.
No. 2 Foundry	12.00 @	12.25	"
Charcoal Foundry No. 1	15.00 @	16 00	"
Charcoal Foundry No. 2	14.00 @	15.00	"

Very few transactions are noted from Chicago, but among them was a sale of 300 tons Lake Superior Charcoal. This would not usually be worth mentioning, but in the present state of the market is of some importance. There is considerable inquiry for Coke Pig from country trade, but only in a general way. Consumers seem merely to be keeping in touch with the market so that they can close quickly in case they should suddenly need Iron, as they are running with very light stocks. Now that production has been so heavily reduced, many are fearing a sharp reaction from dullness as soon as financial questions are settled. The Malleable Castings syndicate will need from 40,000 to 60,000 tons of Lake Superior Charcoal, and the members of the trade are wondering where they will get it, as the stock furnaces are pretty well sold, and very few furnaces are running or expect to run. The quotations given below are subject to concessions for prompt cash and immediate shipment:

Lake Superior Charcoal	$16.00 @		$16.25
Local Coke Foundry, No. 1	13.50 @		14.00
Local Coke Foundry, No. 2	12.75 @		13.00
Local Coke Foundry, No. 3	12.50 @		12.75
Local Scotch	14.0 @		15.00
Ohio Strong Softeners	15.75 @		16.25
Southern Silvery, No. 1	@		14.50
Southern Silvery, No. 2	@		14.00
Southern Coke, No. 2	12.60 @		12.85
Southern Coke, No. 3	12.10 @		12.25
Southern, No. 1, Soft	12.60 @		12.85
Southern, No. 2, Soft	12.00 @		12.25
Tennessee Charcoal, No. 1	16.00 @		16.50
Alabama Car Wheel	@		18.85
Hocking Valley, No. 1	15 25 @		15.50
Jackson County Silvery	16.50 @		17.00

Reports from Southern markets show little, if anything, of an encouraging nature in the Iron trade, and while the volume of business is exceedingly light, lower prices have been accepted for Southern Irons than ever before. There is some little inquiry for miscellaneous forward delivery, but it is not entertained on any such basis. Some factories are not offering to sell Pig Iron at all, but are devoting their energies to settlements. Pig Iron can now be bought at such low prices that it is worth the effort of all who will require it in the early future to secure it now. Quotations are as follws:

Foundry.

Southern Coke, No. 1	$12.75 @		$13.00
Southern Coke, No. 2	10.75 @		11.00
Southern Coke No. 3	10.25 @		10.50
Ohio Soft Stone Coal, No. 1	15.50 @		16.00
Ohio Soft Stone Coal, No. 2	14.50 @		14.75
Lake Superior Coke No. 1	15.00 @		15.25
Lake Superior Coke No. 2	14.00 @		14.25
Hanging Rock Charcoal, No. 1	18.50 @		19.00
Hanging Rock Charcoal, No. 2	17.50 @		18.00
Tennessee Charcoal, No. 1	14.00 @		14.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @		18.00
Lake Superior Car Wheel and Malleable	17.00 @		17.25

Metal Market.

Pig Tin.—Despite a steady downward movement in London that resulted finally in about £1 ℔ ton decline in prices, there has been a quite sharp advance in the New York market, with August delivery moved up to 18.80¢ ℔ lb early in the week, against 18 30¢ a week ago. At the close, however, the price for spot stock receded to 18.65¢. The London price, with duty added, would make the cost of importation several cents above local selling rates and fluctuation in the foreign market, therefore, has had little or no direct influence. One thing is evident, that English market prices are gradually slipping down to a point at which Tin may be shipped thence to this country with profit, although they must melt considerably still to meet prices current in this market, where a margin of about 2¼¢ ℔ lb remains now in favor of local holders. The supply on this side, however, is slowly but surely decreasing, and this cause it is which has probably induced the anxiety to sell for October and later deliveries indicated by the reduction in the margin of difference between prices for current month and later deliveries in this market. Purchases by dealers and consumers have been on a very moderate scale, and the market in general may be described as dull and heavy.

Copper.—Somewhat unusual conditions have prevailed the past week and the market has been very uneven in consequence, with the final outcome such as would indicate that best efforts in the direction of maintaining prices have been futile. Considerable Copper of one kind or other has been taken for shipment to Europe and the report has circulation that surplus stocks of a prominent producer have been about all cleaned up. Against this is a well-authenticated report that a number of

home consumers, after deferring acceptance of Copper tendered on contracts, finally canceled the same and settled by paying differences between original purchase prices and 9½¢ for Lake Superior Ingot, 9½¢ for Electrolytic and 9¢ @ 9¼¢ for ordinary casting brands. Those figures subsequently came out as a reflection of true market value, and in connection with offers on the Metal Exchange at 9.60¢ for October–November delivery imparted a weak undertone. For the moment the market is a very uncertain one, with general financial conditions a drawback that offsets the intended effect of reduced production and quite heavy exports. Such demand as exists from home consumers is for just so much as they imperatively require, and sales are almost entirely in small lots, there being a marked disinclination to stock up ahead in view of the present peculiar position of the metal. A slightly better feeling is, however, reported by jobbers as having developed during the past few days, and the situation is by no means regarded as without hope. Prices for small lots firm and unchanged, at 11¢ for Lake, 10½¢ for Ansonia grade Arizona, and 10¢ for casting.

Sheet Copper.—The completion of some large building operations in various parts of the country, which were so far advanced as to be comparatively unaffected by the existing stringency, has called for supplies of Cornice Copper to a very fair amount. Otherwise the market is dull, although something of a better feeling has been observed during the present week, in a slight increase of orders, well distributed, and considerably more inquiry. The fact is that consumers' stocks are so generally depleted that they are now forced to purchase in order to supply current needs, and this gives a fair movement to jobbers' business. An improvement is also noticed in collections.

Pig Lead.—Prices for common domestic have moved up from 3.30¢ to 3.45¢, with transactions of less than 1000 tons here during the week, and the market closes very firm. The last sales were at the highest price and involved about 300 tons, while 3.50¢ was bid for one or two carloads on the spot. It was reported on Thursday by a large Eastern consumer that no prices could be obtained from Western smelters. Curtailment of output in the West and very light receipts of Mexican Silver Lead Ores figure with some prominence as factors in bringing about the advance. Stocks at headquarters are reported as being very low, and jobbers do not anticipate a very bright future. The retail demand has slacked off somewhat during the past week or two. For small quantities the price remains firm and unchanged at 4¢ for American Pig, and 4½¢ for Bar Lead.

Lead Pipe and Sheet.—A very moderate demand exists. The setback in the building trade caused by the difficulty of obtaining money, which has caused the completion of many building operations to be postponed or curtailed, has been felt in a shrinkage of orders for plumbing goods. Prices are firm at the former quotations.

Spelter.—Ordinary brands of Western have been offered at as low as 3 70¢, delivered here and in this vicinity, without stimulating business. Some brands that are rather above the average may be secured at 3.75¢. In short, the market is weak and dull, with little sign of probable turn for the better in the immediate future unless production be considerably curtailed. The price for small lots has receded to 4½¢ @ 4¾¢, with a probability of these figures being shaded for advantageous cash offers.

Sheet Zinc.—Market dull and lifeless. There is no buying except in very small lots for immediate use. Price ℔ lb for less than cask, 7¢, nominally.

Antimony.—Sales are moderate, but the business passing is at about former prices. We quote at 9¾¢ @ 9⅞¢ for Hallett's, 10⅛¢ @ 10¼¢ for L. X., and 10⅜¢ @ 10½¢ for Cookson's in round lots.

Tin Plates.—Light weight Cokes for prompt delivery have met with somewhat better sale, the demand coming principally from Southern canners who had not stocked up sufficient to meet their requirements for the favorable tomato crop. Some inquiry is also reported in more than one quarter both for spot goods and future delivery, probably encouraged by the more favorable legislative outlook at Washington, and also due, no doubt, largely to the curtailment of Welsh production, which has been very marked during the past week. Otherwise no great improvement is perceptible. The generally fair demand for domestic Ternes continues, although not to the extent that was anticipated for this season, or that would have developed had the monetary situation been more favorable. Prices, meanwhile, although no higher, are steadier than they were a week ago, and it is thought they will not easily drop again. Nevertheless, for spot cash and good amounts it would not be difficult to still obtain material concessions on published quotations. Large buyers are still holding off laying in any heavy stocks and even those who must have considerable quantities of Tin Plates early next month are deferring their purchases, probably waiting for the definite action of the legislature on the Silver Purchase Repeal bill. Jobbers in the city, while looking after old customers, do not appear anxious to fill Western orders just at present. A London cable of August 23 reports: A moderate business in Tin Plates, although the enforced closing of works in consequence of the coal strikes hampers business. Makers are firmer on prices, but buyers are unwilling to respond. Canadian business continues good, but is the exception. 'Frisco purchases are not up to the average. Stocks at Swansea amount to 236,000 boxes, against 268,000 boxes last week. Liverpool prices are as follows:

IC Charcoal, Alloway grade	12/9 @ 13/3
IC Bessemer Steel, Coke finish	11/9 @ 12/
IC Siemens " " "	12/0 @ 12/3
IC Coke, B V, grade, 14 x 20	11/6 @ 11/9
Charcoal Terne, Dean grade	11/6 @ 11/9

Sheet Iron.—The demand for Black Sheets shows little or no improvement. Prices are weak, and stocks ample. therefore to those who will require this material in the near future the present appears a good time to purchase stock. Galvanized Iron is in good demand, and prices are stiffer. It is thought more than likely that an advance in price for this material will be announced within a few days, as stocks are dwindling materially and many mills are shut down, while the demand increases. At the same time, a number of the closed mills are ready to start up again at short notice and any lack of material would be very speedily filled.

Chicago Report.

Scrap.—Dealers are almost refusing to buy any more old material. For such as they accept they pay the following prices:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$8.00	....
Machinery Cast	6.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	4.00	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	6.00	....
No. 2, such as Shovels, Hoes, &c	4.50	....
Old Boilers—whole (Iron)	6.00	....
" (Iron)—cut in single Sheets and Rings	9.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3 50	..
Turnings	5.00	...
Horseshoes	9.00	....
Copper Bottoms	....	5½¢
Copper Clips and Heavy	....	6½¢
Heavy Brass	....	6 ¢
Light Brass	....	4 ¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2¼¢
Rubber	....	2 ¢

Anthracite.—The market is very quiet, but prices are firmly held. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.	
Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

CONDITION OF THE

Hardware Trade.

ALL CLASSES OF TRADE are pursuing the conservative policy which they have followed for some time. Retailers and jobbers are ordering only in small quantities to keep up their assortments, and manufacturers continue to curtail their production to the requirements of the immediate future. Many are still closed down, and those who are running are usually on short time. A tendency in the direction of the curtailment of credits is clearly manifested and little effort is making to sell goods, and travelers who are on the road are sending in small orders.

Advices from Chicago.—The orders for Shelf Hardware have recently increased considerably, but they are all small. This shows that merchants are only keeping up assortments and are not yet prepared to order for stock. The larger volume of business from this accumulation of small orders, however, has greatly encouraged the jobbers. They are looking forward confidently to a good trade during the fall months, especially if the currency question is settled by Congress within a reasonable time. Some very conservative jobbers go so far as to predict decided activity in trade after this happens, because crops are good and farmers are in better financial condition than ever before, and will be good customers of the retail Hardware merchants. Stocks in the latters' hands are so light that any demand at all must lead to important buying from jobbers and manufacturers.

Notes on Prices.

Wire Nails.—An improvement in inquiries has been noticed during the week. Stocks in the hands of the trade are light, and still more so in the hands of manufacturers, whose assortments are generally broken. The price is firm at $1.50 for carload lots at mill for any orders to be shipped after September 1, and it is the impression in the trade that if the condition of business warrants it the makers are getting into a position to be able to make a further advance. Small lots in New York are held at $1.65.

Advices from Chicago.—Some Wire-Nail manufacturers report continued good demand, but others are not so favored. Buyers are evidently waiting to see whether the arrangements now being consummated by the makers will really hold them together. The proof of this will be advanced prices maintained rigidly by everybody. Thus far such a condition has not been realized. Some quote $1.60, Chicago, but others have not changed from $1.50. Perhaps the coming week may bring them closer together. Some of the factories have started up part of their machines to fill broken assortments, but there are few, if any, that will run full handed for some time. Jobbers quote small lots from stock $1.55 to $1.60.

Cut Nails.—While transactions have been small there is a noticeable improvement in inquiries. The quotation remains unchanged at $1.05 for carload lots at mill, and although some sales have been made at lower prices, the market is stronger, in sympathy with Wire Nails.

Advices from Chicago.—Cut Steel Nails have not kept up the pace with which they started off last week, but business is not as dull as it was before the spurt. Nails are being called for quite steadily and specifications accompany the orders. Prices are unchanged at $1.20 to $1.25, for factory lots. Jobbers quote $1.30 for small lots from stock.

Barb Wire.—There is little to note in this market, and quotations remain nominally at $2.45 to $2 50 for carload lots at mill for Four-Point Galvanized, with the usual advance for small lots from store.

Advices from Chicago.—Inquries are increasing and manufacturers report many of them resulting in orders. They hope that the dull season has at length ended for this year and that business will steadily improve. Stocks are very light in manufacturers' hands and for immediate shipment they ask $2.50 to $2.60 for Galvanized. Jobbers quote small lots of Galvanized from stock at $2 60.

Kodak Rat Trap.—The Kodak Rat Trap, manufactured by the Waddel Wooden Ware Works, Greenfield, Ohio, which was illustrated in our last issue, is sold to the trade at $2.25 per dozen.

Magic Columbian Lock.—This Lock was recently illustrated in our columns. It is put on the market by the Magic Introduction Company, 321 Broadway, New York, and is sold to the trade at 75 cents per dozen.

Magic Gas Lighter.—Magic Introduction Company, 321 Broadway, New York, are putting this article on the market. The device is sold to the trade at $4 per dozen, or $42 per gross.

Glass.—Developments of the past week have emphasized the fact that the demand for American Glass is not large enough to warrant an early start of the factories, although assortments of single-strength Glass at factories are reported as being broken. A feature of the situation is the selling of foreign Glass by importers at prices under those made by the National Window Glass Company to buyers other than members. This price is reported as being from 80 and 10 per cent. discount to 80 and 20 per cent. discount, according to quantity. The stocks of Plate Glass at factories are being reduced, though the amount of Glass in manufacturers' hands is great enough to supply demands for some time to come. Quotations remain unchanged on all lines of Glass.

Old Rubber.—The market continues dull and weak. What little business is being done is at about the following prices, delivered in New York :

Car Springs, ton lots, ℔ lb.	....	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb..	....	@	.03
Rubber shoes, less than carloads	2¼	@	.03⅛
Large Hose, ℔ ton	....	@	9.00
White Wringer Rolls, ℔ lb.	....	@	.04¼
White Syringes, ℔ lb	....	@	.05

Old Rags, Paper, &c.—The demand has been fair for certain descriptions of Paper Stock. Prices are fairly steady at about the following figures, delivered in New York :

No. 1 White Rags	℔ lb	3½	@ 3¾¢
No. 2 White Rags	℔ lb		.. 1¾¢
Mixed Rags	℔ lb		1 ¢
Blues and 3ds	℔ lb		1 ¢
Hard Sized White Shavings	℔ lb		2½¢
No.1 White Book Shavings	℔ lb	2⅛	@ 2¼¢
No.2 White Book Shavings	℔ lb		@ 1¼¢
Light Book Shavings	℔ lb		¾¢
No. 1 Mixed Shavings	℔ lb		1¢
No. 2 Mixed Shavings	℔ lb		½¢
No. 1 Printed Books	℔ lb	1	@ 1¼¢
Ordinary Mixed Books	℔ lb	½	@ ¾¢
Newspapers	℔ lb		½¢
No. 1 Manila Paper	℔ lb	1	@ 1⅛¢
No. 2 Manila Paper	℔ lb	¾	@ ⅞¢
Bogus Paper	℔ lb	⅝	@ ¾¢
Common Paper	℔ lb	⅝	@ ½¢
Straw Chips	℔ lb	½	@ ⅝¢
Binders' Clippings	℔ lb	¼	@ ⅝¢
Jute Butts	℔ lb		1 1-10¢
No. 1 Jute Bagging	℔ lb		1¼¢
Mixed Bagging	℔ lb	¾	@ 1 ¢
No. 2 Bagging	℔ lb	½	@ ¾¢
Hemp Twine	℔ lb		2¼¢
Manila Rope	℔ lb		2½¢
Jute Rope	℔ lb	1½	@ 1⅝¢
Mixed Rope	℔ lb	¾	@ ⅞¢

Old Metals.—There is small demand for Old Metals, and the market shows little sign of immediate improvement. Prices remain weak and irregular ; the following quotations representing approximately those now ruling in New York :

Heavy Copper	℔ lb	8¾¢
Light and Tinned Copper	℔ lb	7½¢
Heavy Brass	℔ lb	6¢
Light Brass	℔ lb	5¢
Lead	℔ lb	3¢
Tea Lead	℔ lb	2¾¢
Zinc	℔ lb	2¾¢
No. 1 Pewter	℔ lb	14¢
No. 2 Pewter	℔ lb	7¢
Wrought Scrap Iron	℔ gross ton,	$12.00
Heavy Cast Scrap	℔ gross ton,	8.00
Stove Plate Scrap	℔ gross ton,	5.50
Burnt Iron	℔ gross ton,	3.75

Trade Notes.

STRANSKY & Co., 27 Murray street, New York, have recently issued an illustrated price-list of their extensive line of wares. The Cameo Stransky Steel Ware, which opens the volume is shown in various forms : Saucepans of all sorts, Stewpans—Preserving Kettles, &c. Then come Teapots, Coffee Pots of the same material, followed by the Royal Tea and Coffee Pots, made with nickel-plated covers and wood handles and hinges, recently patented. The list of Cameo articles covers over 50 pages, and includes a wide variety of household utensils and house-furnishing goods. At the close are several pages for memoranda, as well as an alphabetical index. All the articles are illustrated, full price-lists being given in connection with the engravings.

J. S. CAPRON, traveling in New England for Dean Mfg. Company, mak-

ers of Tinware, Taunton, Mass., has just returned from the World's Fair and is out among the trade again.

CHARLES THOMAS, 215 West Second street, Elmira, N. Y., issues a four-page catalogue descriptive of the Waugh Circular Shears. On the front page is an illustration of his No. 1 and No. 2 with bevel and squaring attachments. The second page illustrates the No. 3, which is made for both hand and power, while on the third page the No. 5 Circular Shear is represented, this being a heavy, substantial tool from new patterns. The No. 5 Shear will cut circles up to 30 inches in diameter and up to 14 gauge iron or mild steel. The weight is 650 pounds. It is back geared 4 to 1. Brief descriptive particulars are given of these machines as well as a price-list of each.

CUYLER & MOHLER have opened a supply store at 2206 Boston street, Baltimore, Md., and announce their intention of catering to the wants of the mill and machinists' trade. Mr. Cuyler of the above firm has an extended acquaintance throughout the South, where he has traveled for the past ten years for some of the largest manufacturers Mr. Mohler has up to a recent date represented the Magnolia Anti-Friction Metal Company.

THE RECORD MFG. COMPANY, Conneaut, Ashtabula County, Ohio, issue a circular letter under date of August 22, from which we quote as follows: "We believe the worst of the financial scare is practically over. Our wheels have not stopped. Our tin-working and wood-working departments in our manufactory have been kept running, also our Tin-Plate plant. We are on hand to receive your orders for Record's Butter and Lard Packages, Record's Wood Incased Shipping Cans, Varnish Cans, Sugar Makers' Supplies, Sap Spouts, Pails and Syrup Cans. In our Tin-Plate works we have put into service Record's New Tin-Plate Cleaning and Polishing Machine, which works grandly, doing work that has always been done by hand and producing Tin Plate superior to hand work. All Record's brands of Tin Plate will be run through this machine."

R. E. DIETZ COMPANY, New York and Chicago, manufacturers of commercial, railroad and other Lanterns and Oil Stoves, have issued an illustrated catalogue of their goods in the Spanish language for distribution largely in Mexico, Central and South America and the West Indies, although suitable for any market where that language is spoken. This pamphlet of 111 pages calls attention to a large assortment of tubular Lamps and Lanterns, embracing dash, fire department, side, hand and socket, street, hanging, car, square, triangular and government Lamps. Also marine and bridge signal Lamps, conductors', police, pocket and trade Lanterns. A good line of oil cooking and heating stoves is likewise given. This volume is similar to the one printed in English some time ago, except the language.

WALLACE & SONS, manufacturers of Brass and Copper goods, at Ansonia, Conn., with offices at 29 Chambers street, New York, suspended on Wednesday, and their affairs were placed in the hands of receivers. Thomas Wallace of Ansonia, the treasurer of the concern, and Robert M. Thompson, president of the Oxford Copper Company, have been appointed receivers, both in this State and in Connecticut, on the application of John B. Wallace, the secretary, and U. T. Hungerford, the manager of the New York office. The reason for suspension is given as inability of the company to collect outstanding accounts from customers, on account of the financial stringency, and consequent inability to meet notes falling due in the present month. The liabilities are placed at $875,000, of which $450,000 is on open accounts, nearly all of which are past due, and $425,000 on notes. The nominal assets are put down at $2,000,000, of which unemcumbered property, including rolling mills, wire mills and factory plant at Ansonia, is valued at $1,000,000, book accounts at $600,000 and merchandise at $400,000. It is expected that the suspension will only be temporary, as the assets of the concern largely exceed their liabilities. The business was established at Ansonia in 1848, and incorporated in 1853, with a capital stock of $100,000.

THE FACTORY of the Lalance & Grosjean Mfg. Company, at Woodhaven, L. I., was started up again this week after a briefer shut down than was anticipated. The establishment will be run on half time for the present.

A PRESS REPORT from Chicago, under date of August 24, states that F. W. Lamb & Co., manufacturers of steam heating apparatus, have assigned.

Prize Competitions.

Prize Competition No. 27 (Reopened).

Local Associations of Merchants.

This competition closed July 8, but in view of the exceptionally few replies which have been received from the trade and the importance and practical nature of the subject, we reannounce it as above, and extend the time up to which responses will be accepted to September 16.

The formation of local associations has been found feasible in many places for the purpose of securing more friendly relations among competitors and reaching an understanding in regard to matters of common interest. Among the good results referred to as coming from such associations are the following: Overcoming petty jealousies; cultivating a spirit of fraternity; listing of undesirable customers; an understanding in regard to time of presenting bills; putting in operation early-closing movements; agreement as to the prices at which goods are to be sold; mutual accommodation in supplying goods which one merchant may be temporarily short of, &c. The subject is thus evidently a broad one and of a good deal of practical interest. In discussing it the following points are suggested:

Whether it is desirable to have such associations;

How such associations may be organized;

The objects to be accomplished by them.

It will also be of interest to have any information in regard to the practical working of such associations.

This competition will remain open until September 16, 1893.

Those intending to compete are reminded that it will not be necessary to write long essays, but that comparatively brief and business-like answers will be favorably regarded as meeting the purpose for which these competitions are announced.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

The prizes will be awarded for answers which, in the judgment of the Committee of Award, are most suitable for publication and of the most general interest.

The committee to whom the papers in Competition No. 23 were referred have awarded the prizes as follows:

First prize to J. E. JANSSEN.

Second prize to C. O. F. YOUNGSTROM.

Third prize to E. H. MASON.

News and Notes.

Kansas has still open for settlement nearly 1,000,000 acres of unoccupied Government lands.

A striking instance of a nuisance being converted into a profit is, says the London *Engineer*, afforded by the new process for extracting sulphur from alkali waste. At Widnes alone 500 acres must have been covered with it to an average depth of 12 feet. These 10,000,000 tons of noxious material have been with great difficulty prevented from being a source of intolerable nuisance throughout a large district, owing to the amount of sulphur contained, and the consequent discharge of sulphureted hydrogen into the air.

The Columbian Steamship Company, in connection with the Panama Railway and the North American Navigation Company, have issued a new tariff on west-bound shipments, affecting several hundred kinds of manufactured goods. The new rates are very much lower than have been heretofore in force either by rail or isthmus, and present a reduction of from 40 to 76 per cent. from the latest reduction in rail rates.

The quickness with which our American hustlers can work when caught in the horns of a dilemma was well illustrated at Muncie, Ind., a few days ago, observes a Western exchange. The material for building 1 mile of electric railway arrived in that city, after having been "lost" on the railroad for 12 days, at 4 o'clock Monday morning. The rails and other materials were unloaded and hauled from the cars, over a mile, where the work of road making began. This was kept up until 12 o'clock the next day, when, after just 32 hours' work, 4800 feet of track had been laid, the track lined up, surfaced, dirt thrown back in, the poles erected, the trolley wires strung, the feeders tapped in and a car started over the track. More than 8000 persons were carried to the baseball game over the road that afternoon.

After many experiments the Central-Hudson Railroad Company have found a method of lighting passenger cars perfectly by electricity. At one end of the car which has been equipped is a dynamo about 4 feet high, which is connected with one of the axles of the car. Near the dynamo is a small storage battery. When the car is in motion the dynamo not only supplies electricity to light the 60 incandescent lamps which are suspended along the sides of the car, but also stores a quantity away for use when the car is not in motion. The dynamo and battery are well secured in a closet, upon the door of which are six large padlocks, which renders it impossible for any person to secure a drawing of the mechanism.

Briquettes made of solidified petroleum on the system of Lieutenant Maestracci of the Italian navy have been tried on several tugboats at Marseilles, and were found to give out three times the heat of ordinary coal briquettes, while leaving no residue behind. It is hoped that with a few simple modifications of the furnace the calorific effect will be so far increased that the solidified petroleum will equal four times its weight in coal, and that smoke will be almost entirely suppressed.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

A first-class man to work on heavy galvanized iron; state salary. "G.," Box 826, office of *The Metal Worker*, 96-102 Reade street, New York City. Aug. 26

American Tin-Plate Statistics.

There has been no little comment upon the action of the Secretary of the Treasury in withholding the statistics collected by Special Agent Ira Ayer of the production of American tin plates. The quarterly report, including the statistics up to April 1, was promptly sent in to the Treasury Department, where it has lain concealed for months. Rumor is to the effect that the present Secretary has directed that the figures be reclassified so that they will show the quantities of tin plate made from American black iron and from the imported sheets, and it is intimated that, possibly, there may be a new ruling of the Department affecting the definition of American tin plate. It will be remembered that under the former administration it was announced that the plates tinned in this country, without respect to the place of their original manufacture, should be classed as an American product and should be entered as such in the statistics that are being kept. The importance attaching to the quantity of the American product is, of course, well known, for upon the output of the American works previous to 1897 will depend the continuance of the present law, that is, provided Congress does not in the mean time repeal the tariff act of 1890. According to the wording of the act, the statistics must show that during either of the six years preceding 1897 the domestic product of tin plates has equaled one-third the amount of such plates imported during any year of the same period if the tariff is to be retained. It is evident, therefore, that those who are interested in the continuance of the present duty of $2\frac{3}{10}$ cents per pound are anxious to make the domestic product appear as large as possible, and this will be very greatly increased or diminished as the tin plates made from foreign black sheets are included in or excluded from the total figures.

The Treasury Ruling.

According to the present interpretation of the law, as above noticed, foreign black plates tinned here will count as American tin plates, but there is a new Secretary of the Treasury since this interpretation was promulgated, and it lies with him to acceptor to change the ruling of his predecessor. While the Secretary occupies, in a certain sense, a judicial position, a ruling is simply his opinion as to the meaning of the statute. It, therefore, is evident that he himself, or his successor in office, can reverse his opinion. The decision in the present case is a difficult one and reports have come from Washington that inquiries are being made by the Treasury Department in many places to find precedents for a tin-plate ruling. Plates made in England and tinned in Wales are classed as Welsh plates, but it is difficult to find many cases sufficiently alike to form precedents, and even though the Secretary is persuaded that foreign black plates should not be turned into American tin plates, it does not follow that he will reverse the present interpretation of the act. It is, however, strange that while the decision is pending the figures collected by the special agent of the Treasury have not been made public, as it is a matter in which there is a great interest. A classification of the production as American made and as black plates tinned in this country would not commit the Department to any view of the matter, while it would furnish the information which the public are anxious to secure.

Classifying Information.

The systematic classification of information relating to one's chosen trade or profession, and its ready application as a result of this classification, cannot fail to improve a man both intellectually and financially. In these days of book and newspaper there is scarcely a progressive man who does not take a trade paper and own a few technical books. In the periodical reading of his paper he notes many things of value, but not being interested in them at the moment they are not impressed upon his memory. When at some future time their information would be of marked value to him he has either forgotten it altogether or at least cannot remember where he saw it. It is his ability to find at short notice information regarding any given subject that makes him valuable, rather than his mere encyclopedic knowledge. His mind is not burdened with a load and yet he is practically as well equipped as though his head carried it all.

Scrap Books.

The scrap book always suggests itself as the most ready and simple means of retaining newspaper clippings. But it usually fails just as it becomes of greatest service, for as soon as the material has accumulated in sufficient quantity to make reference to it desirable, it will take too much time to find it unless the entire book is satisfactorily indexed. To avoid the necessity of thus indexing, it has been found very satisfactory to substitute a series of large, stout envelopes for the scrap book. These envelopes may be variously titled according to their contents, which may consist either of newspaper clippings, illustrations, sketches or memoranda. A proper alphabetical arrangement of these envelopes makes it an exceedingly simple matter to instantly find all the material of this character relating to any given subject. The arrangement is expansible without limit, and the envelopes may be classified and sub-titled with the greatest refinement.

Card Index.

For the classification of such material as cannot be filed in this manner, or even for the purpose of making the scrap book practical, the card index stands as above all other methods the best. This can be adopted of the form of the general library index, with cards about 3 inches by 5 inches. A card relating to any given subject may be filled in at any time and place and subsequently dropped into its proper position. Like the envelope system, there is no limit to the extent of this arrangement, and anything conceivable may be entered upon the cards. Before starting the project, however, the entire subject of card indexing should be studied, for it is an art in itself. The general style in which the card is to be filled out should be decided upon and adhered to. All cards should be titled under the broadest word in the title—that is, the one which the other words simply modify. This first word then becomes indicative of a class, while the modifying words indicate the subdivisions of this class. As the index increases cross reference cards, division cards, and the like can be introduced—in fact, any device or arrangement that will facilitate the use of the index.

Refuse Disposal and Utilization

A report of the borough engineer of the city of Southampton, England, published in the *American Architect*, gives some very interesting details in regard to the disposal of the city's refuse and sewage. The Southampton destructor is said to be the best in England, and is capable of disposing of 50 to 60 tons of garbage per day. The sewage is clarified by precipitation, and the resulting sludge is passed into the destructor. The residue from the

continuous day and night combustion consists of about 20 per cent. of good, hard clinkers and sharp, fine ashes. The clinkers are used for the foundation of roadways and the manufacture of paving slabs. The latter are said to have been used in paving several footpaths of the town and some large public baths, at a cost of about 60 cents per square yard. The fine ashes are also employed for making mortar, with which many public buildings have been erected, and for many other purposes. The mortar is also sold to builders at $1.80 per cubic yard. The waste heat from the destructor is used for producing electricity, giving the light for two arc lamps, in the works, of 3000 candle-power each, and 12 incandescent lamps of 16 candle-power, besides supplying the lights of four streets in the vicinity of the works, the Town Hall and other municipal buildings. The total annual expenditure for the maintenance of the destructor and the sewage works is about $2790, while the receipts from the sale of manure, clinkers, concrete, slabs, ashes, &c., reaches some $4380, so that the apparatus is a good investment on the original outlay of $32,715. It would seem that the provision of similar methods of disposing of city and house refuse might be readily made more general. That it tends to ameliorate the public health has been proved in many cities where destructors or cremators are already in operation.

The Repeal of the Sherman Act.

The unexpectedly large majority secured in the House of Representatives for the repeal of the Silver Purchasing law must be regarded as a distinct triumph for the solid business interests of the country. Its greatest good is likely to come from the effect which it will produce upon the trimmers and talkers in the Senate. Even as it is, the business world has had its patience taxed to the limit of endurance. When commerce and industry are in the condition in which they have been for months, immediate relief is demanded. What is wanted is action, and not rhetoric, and the sooner the Senate follows the House in passing a repeal bill the better, because it is the course of that body which has been in doubt. Even now the improved chances of favorable action are being discounted. Still, absolute certainty is required to restore confidence, particularly abroad, from whence the contagion of doubt first spread.

Efficient Foremen.

The test of efficiency in a foreman is how much good work he can properly and legitimately get out of the men placed in his charge. It is to be noted that in this proposition is embraced the ideas of quantity, quality and means used for obtaining these ends in work performed for wages. Either quantity or quality may fall short, and the foreman's skill is not up to the standard unless a full measure of both is obtained. If these cannot be secured except by resort to such methods as are certain to breed disaffection, discontent and disloyalty to the interests of employers in the ranks of the employed, the foreman is unqualified for his position, and is a damage to the establishment in whose service he is engaged.

Qualifications for a Good Foreman.

It is difficult if not impossible to specify all the qualifications needed by a competent foreman. Of course he must know what is good and bad in the quality of the work the performance of which he is placed to superintend, and he must himself know not only how to execute and how to teach others to do this work, but also the quantity of the work that he can justly demand from each workman under his charge. But beyond these essential qualifications, which will be, perhaps, possessed by nine-tenths of the men he supervises, he must possess something more, found only in comparatively few artisans. Tact, adroitness in management of men, power to command willing and ready obedience, ability to maintain discipline in a shop without exasperating men, and without arousing antagonism to his authority. These are a few of the general ways of expressing what is needed in a foreman beyond mere skill in the craft to which he belongs. But, after all, these expressions mean something quite impossible to define minutely. Summed up, they mean that besides being an expert in the art to which he attaches himself, he must have other qualities that cannot be specified in detail, and that whether he has them or not can only be determined by results attained when he first steps out of the ranks into a position of command.

FLASHINGS.

J. M. Robinson & Co., Cincinnati, Ohio, issue a number of illustrated circulars relating to the machinery of their manufacture. The pamphlets, all of a size, measure 8½ x 6 inches, and contain full accounts of the tools referred to. One of them is devoted to cornice brakes, showing general views of the brakes made by the company, describing them thoroughly and giving diagrams of the moldings and shapes that can be executed by their tools. A second pamphlet shows their improved 8-foot heavy bending power brake, likewise stove and range makers' brakes, folding machines, &c. A third pamphlet shows the V-crimping and corrugating machines, curving rolls and other tools, all of which are completely illustrated and described. A fourth pamphlet which has recently been issued by the firm relates to a variety of hand, foot and power punching presses, showing screw presses, gate cutters, pendulum foot presses, power presses, drop presses and power lifts. The power punching presses are shown in a large variety of styles, all the machines being illustrated and described, with tables of dimensions, prices, &c.

British Board of Trade returns for the first half of this year show a remarkable increase in the exports of galvanized and corrugated iron to Central America, South Africa, the East Indies and Australia. The use of this material is said to be largely increasing in warm climates.

W. J. Wilder, Hampton, Iowa, issues a circular addressed to manufacturers of sheet metal respecting the advantages of aluminum-alloy coated sheets. In the circular referred to he mentions the objections to galvanized iron and the difficulty experienced in making bends, due to the flaking off of the metal. In his opinion the cause of this is "the grain of the spelter is too coarse to enter the fine pores of the steel." Sheets, however, coated with aluminum-alloy, he claims, overcome this difficulty. The alloy is a combination of aluminum and other metals, containing no poisons. At the bottom of the circular is a reference to a test of aluminum-alloy coated sheets, subjected to water and slush for six months without any sign of rust. Sheets of this sort may be soldered with ordinary solder and acid flux.

SCRAP.

R. Wallace & Sons Mfg. Company, Wallingford, Conn., are using about 1000 tons a year of American black plates, which they manufacture into tin spoons and other articles. The firm report themselves as greatly pleased with the quality of the domestic material.

At Apollo, Pa., P. H. Laufman & Co. are running their sheet mills and tinplate works to full capacity. Operations are temporarily suspended in the mills of the Apollo Iron & Steel Company. The steel works are in operation.

At Canonsburg, Pa., the works of the Canonsburg Iron & Steel Company are in operation, with the exception of No. 1 tin mill. The old black plate mill has been running steadily for the past six weeks and the puddlers have worked part time. The two sheet mills were started up last week.

The St Louis Stamping Company, St. Louis, Mo., have resumed operations in all branches of their works after an idleness of nearly two months. The proprietors have, it is reported, signed the Amalgamated scale, and 2000 men were set to work on Thursday, to the great relief of the large number of people who depend directly or indirectly upon these works.

Wallace, Banfield & Co, Limited, of Irondale, Ohio, announce that they have appointed Casey & Day, 445 The Rookery, Chicago, as sole agents for their Irondale Tin and Terne Plates.

Prize Competitions.

Prize Competition No. 27 (Reopened).

Local Associations of Merchants.

This competition closed July 8, but in view of the exceptionally few replies which have been received from the trade and the importance and practical nature of the subject, we have reopened it, and extend the time up to which responses will be accepted to September 16.

Some points in regard to the subject appeared in the announcement concerning the competition in our last issue, and will probably be of service to those who are intending to compete.

The committee to whom the papers in Competition No. 24 were referred have awarded the prizes as follows:

First prize to C. T. Rosenthal.
Second prize to Ross F. Rainey.
Third prize to J. E. Janssen.

THE LETTER BOX.

Cleaning Galvanized Iron.

From L. G. L. & Co., *New York.*—Can *The Metal Worker* tell us what to use to clean an article made from galvanized sheet iron after it is finished?

Note. — Articles made from galvanized sheet iron that have tarnished in the making or while in stock may be cleaned so as to present a bright appearance by washing or scrubbing with a solution consisting of ½ pint of muriatic (hydrochloric) acid and 1½ pints of water. They should be thoroughly rinsed after the washing, to remove all of the cleaning fluid, and carefully dried. A thin, transparent varnish or lacquer on the goods after they are cleaned will preserve their bright, clean appearance for a long time by protecting the galvanizing from the action of the air.

Cold Air from Hall.

From J. J. WILSON, *Troy, N. Y.*—Having had my attention called to communication from "Western" in *The Metal Worker* of July 8, entitled "Cold Air from Hall," I desire to make a few remarks in regard to same. The general tenor of this essay would lead one to suppose that the setting of furnaces so as to obtain satisfactory results was a game of chance, and a majority of the essential details largely supposition. "Western" says if the house is properly situated, the north or west side of the building is selected and the cold-air box made equal to three-fourths the total area of all the hot-air pipes. Under such favorable circumstances the furnace is supposed to operate in a proper manner and furnish the desired amount of hot air to each register. Does it do so? Then follow remarks in regard to cold air coming up through warm-air registers during the prevalence of high winds. In answer to the above, I can say the furnace will work if properly located, the warm-air pipes and cold-air duct of necessary size, and the cold-air connections made as they should be. If "Western" will examine the pages of "*The Metal Worker* Essays on House Heating" he will find this subject thoroughly discussed, and also drawings which will show him how cold-air should be connected to overcome this difficulty. In regard to the closing of damper in cold-air box, what would a dealer think of a customer who would object to using the oven damper in a range or cook stove, when they wished to heat oven for baking, and insist upon this being done without any attention to details? The comparison is not overdrawn. One would have just as much reason to expect to close off the warm air from an overheated room by simply wishing so, instead of closing the register or the damper in the warm-air pipe, as to expect a furnace to operate in a satisfactory manner without attending to the different appliances and dampers. Regarding warm air coming out of cold-air box, there is an old adage which teaches us that there is always a cause for an effect. Having had the pleasure of calling commercially upon a majority of the heating trade from the Atlantic to the Pacific, I have at different times had my attention called to this condition of affairs, and have had some curious experience in regard to this matter, but I have never met with a case of this kind but that it was due to an oversight in giving proper attention to details. As regards taking air from the cellar for the furnace, this is done quite often in that class of work which is cheap to buy, but dear to own. Hardly any rational person if given his choice, aside from the expense, would choose this mode of procuring air. Few would care to use the cellar as a living room, and yet this is the effect accomplished by using cellar air. No man would intentionally devise means to injure the health of his family, yet will any one affirm that a house heated in this way is as healthy from a sanitary point as the house which has been provided with adjuncts for a bountiful supply of outside air? I know of some localities where the entire supply of air to the furnace is taken from the hall or other room. The ultimate object attained by this means generally is the using of a furnace with small fire pot in proportion to size of casing used, or one that is short in square feet of heating surface. There are, however, many points in the extreme East and West where a moderate sized exhaust pipe taken from the hall to be used in conjunction with cold air from outside is beneficial—viz.: During extreme cold weather before retiring at night it is customary to fill the furnace fire pot with coal and set the different appliances to check rapid consumption of fuel. The fire surfaces of the furnace being by this process cooled, will not heat air to the temperature that it would if drafts were open; therefore, instead of using outside air at a temperature near zero, air is taken from the hall at a temperature of about 50°. The lower rooms adjacent to the hall are not occupied during the night, hence the air is not much contaminated and the temperature of air in the entire house much higher than if outside air had been used. This, then, is the proper use of exhaust from the hall or room—viz.: to be used only as an adjunct.

Account of a Well Cooler.

From C. A. S., *Springfield, Ohio.*—As a practical illustration of the benefit of your Letter Box in *The Metal Worker*, I give you a bit of my experience. When I built my house I drilled a well 40 feet deep in the rock under the kitchen, but a few years afterward a large dormitory building was erected on the next lot, and they put in a sink hole and contaminated the water in my well so that I had to abandon it. Some time ago I noticed the discussion about a well cooler not working properly, and the idea struck me why not run my pipe for city water down in the well and up again and get cool water, instead of using the water warm, as it usually is in the mains. Acting on this inspiration, I pulled up the old pump that had been standing for several years unused in the well, and taking off the pump and suction chamber, put a U on the bottom, connecting a ½-inch pipe to it, and running to the water faucet. I then connected the city water to the top of the pump pipe and dropped the whole thing in the well. We are now using most delightful spring water, cool and clear as though it came out of the old oaken bucket. I have gotten several such things out of *The Metal Worker* simply by putting in practical operation such ideas as I have gathered or which came to me in a leisure moment from reading the paper. I have been a subscriber to *The Metal Worker* since 1874, and value it as the best among all the publications that I take—and I take several.

Squared Roofing Tin.

From W. H. B., *Monroe, N. Y.*—Notwithstanding the claims made by the advocates of steel and terne plate standing-seam roofs, there is still a large amount of flat-seam tin roofing laid. The ordinary terne plates are often irregular in shape, with curved ends and sides not being squared before placing in the box. The sides and ends of such sheets must be cut and the corners clipped before the edges can be turned. These operations should be performed by the manufacturers. Why do not some of the manufacturers of American roofing plates offer the trade sheets with the edges squared and turned ready to lay on the roof? When the sheets have the edges turned they pack together nicely, and four packs of 28 sheets each would constitute a box of 112 sheets as now, and this work could be done cheaper in a large way by the manufacturers than at the shop or job by the roofers. We do not make our own clothes, harness, or for that matter our tinware, as of old, and why not have our roofing plates delivered to us ready to lay? It must be a simple operation to cut the corners off of a box of plates by means of the powerful machinery now at hand, and there is, I believe, an edger made that turns the four edges on roofing plates at once, but the price removes it from the reach of most roofers. By the use of improved machinery it appears possible to offer the trade roofing plates squared, clipped and edged ready for laying on flat-seam work. Such an improvement should command the attention and patronage of the trade as soon as introduced.

Answer.—If our correspondent simply required terne plates that were squared he could be accommodated, as there are manufacturers who make a practice of squaring certain brands of plates. There are other brands or grades that are not squared. As stated by a prominent dealer, there is so much competition in price that makers do not care to add the cost of squaring, especially as the plates may be required for various uses for which squared plates are not demanded. Regarding the turning of edges on plates, the objection raised by a number of roofers was that if such a course was to be followed the various makers would not all produce sheets or edges of the same size. Then, as the packages would be more bulky, the boxes would be more

expensive and freight charges increased. Also that the notching and turning of edges on plates was something that could be done by the men at odd times, or during stormy weather. Other roofers were of the opinion that turned roofing plates would be an improvement, providing the price charged for the work was not too high.

Wants the Plumbers' Opinions.

From S. W. H., *Maine.*—In answer to "M. C. H.," whose question appears under the above heading in *The Metal Worker*, August 19, I suppose a number of opinions exist as to whether an iron or lead trap is best for the purpose mentioned. I think lead traps are best, because there is no danger of breaking with the settling of the soil pipe and no sand holes are found in them. Iron traps frequently have sand holes, and are not true and have to be blocked up to make them set level, while a plumber can readily fit a lead trap to the requirements. With my experience I should vote for the lead trap every time.

A Chimney Problem.

From OLD RELIABLE, *North, Mo.*—In answer to "X. Y. & Z.'s" chimney problem in *The Metal Worker*, August 12, I find by the explanation and sketch that the fault is entirely in the two stoves. It is well known that the Todd stoves, especially when new, are practically air tight, and the older the stoves get the less trouble they will cause. Now for the remedy: Punch a 1¼-inch hole in the lower part of the first joint of pipe and make a sheet-iron slide damper to cover it. Then every time the present damper is opened open the slide damper in the pipe.

Lining for Tank.

From APPRENTICE, *Bainbridge, N. Y.*—Please inform a subscriber how the operation of lead burning is performed when a tank is to be lined with sheet lead. Is lead better than copper for the purpose? Some are of the opinion that lead is injurious to water. How should the lead be fastened to the sides of a tank?

Answer.—We refer our correspondent to the following articles that have been published in *The Metal Worker* this year: "Lining Tank with Copper," March 11. "Lining a Tank," April 22. "Lead Burning," June 3. Either lead or copper, if of sufficient thickness, is well adapted for lining a tank, providing the water is not to be used for culinary purposes, although both of the metals are acted upon to a certain extent by some kinds of water. Pure waters act upon lead and copper with more energy than those that contain carbonates, as most waters do. When lead or copper is exposed to the action of air and water alternately, it is liable to corrosion, and on this account water in metal-lined tanks should be maintained at as nearly one level as possible. Lead is not suitable for lining tanks to contain hot water, as the steam condenses on the lead. The combined action of air and water corrodes the lead, and as the water drips back into the tank it is liable to carry the corroded lead with it. If the water from the tank is to be used for culinary purposes tinned copper would be the proper material to use, as tin is not acted on by water.

The sheet lead is secured to the sides and ends of a wooden tank by making countersinks or dots in the wood about 2 feet apart. These dots to be about 2 or 2½ inches in diameter, and ½ inch deep. After the lead is in position it can be sunk into the dots with the back of the wiping ladle. Then scrape the dots and apply plumbers' soil about the edges. An iron or steel screw is then to be put in the center of each dot, allowing the head of the screw to project a little, but not beyond the inner surface of the tank. The dots are then ready for wiping, which is to be done in the usual manner.

Plumbing Regulations.

From L. E. N., *Westfield, Mass.*—Can you tell us how we can learn the regulations that govern plumbing in different cities?

Answer.—In *The Metal Worker*, April 29, the regulations of Washington, D. C., were given, and those of Mt. Vernon, N. Y., May 27; Massachusetts State law, July 29, and of Yonkers, N. Y., August 5. By writing to the Board of Health of a city a copy of the regulations in use could probably be secured.

Information About Rubber.

From J. F. S., *Seneca, Kan.*—I would like to ask the "boys" who contribute to the Letter Box if any of them can tell me how the rubber of old wringer rolls can be dissolved, so that it can be molded and returned to the same state as it was before being dissolved.

Gas Heating Stoves.

From H. W. F., *St. Louis, Mo.*—I have an idea to heat my rooms, such as dining, sitting and bed rooms, with gas stoves, or gas radiators, this winter, coal gas being used, as there is no natural gas here. Please state in *The Metal Worker* if they are practical and healthy to use for that purpose. I would also like to hear from some of the readers of *The Metal Worker*.

Answer—If a gas stove is set like an ordinary coal stove, there is no question whatever as to its healthfulness. Small gas stoves are sometimes set in rooms without any flue connection and in that case they do not do any appreciable harm on account of the room being ventilated by opening doors and the gas given off being not more than what is evolved by a gas jet or lamp flame. Gas stoves, however, of sufficient capacity to warm a house should be connected with a chimney, the same as a coal or wood stove. Not only will such connection keep the atmosphere of the rooms purer, but it will prevent the frosting and wetting of the windows so common where gas is burned in an unventilated room.

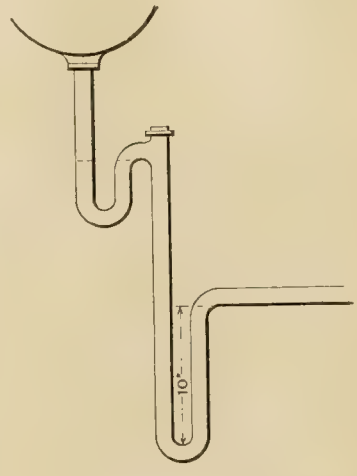
Book on Explosives.

From M. D. S., *New York.*—Please inform me through *The Metal Worker* what is the most complete work touching the latest improvements in explosives for mining work.

Answer.—A well-known work on this subject is "Eissler's Explosives, Nitro-Glycerine and Dynamite." The price of the book is $4 and it can be obtained through the Book Department of this office.

Air-Bound Pipes.

From G. F., *Washington, D. C.*—Please inform me through *The Metal Worker* what pressure is required to overcome a certain obstruction in a closed water pipe. For instance, what hight of column is necessary to overcome an air-bound trap 10 inches deep and 1 inch in diameter, or if there are two traps on a level with air between them, what head would it take to overcome them? In the sketches



Air-Bound Pipes.—Fig. 1.—Traps on Different Levels.

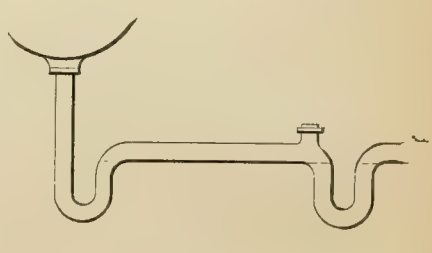


Fig. 2.—Traps on One Level.

Fig. 1 shows one trap above the other, and Fig. 2 shows the trap on a level; the air is between them in both cases, and there is a plug for filling the further trap.

A Questionable Chimney.

From CÆSAR, *Louisville, Ky.*—I would like to get through the Letter Box ideas from practical men on the following case: Having contracted to place a hard coal furnace where its capacity of 50,000 cubic feet will be required, I find that the chimney is only 3 x 12, and does not extend to the cellar. Would a first-class furnaceman connect such a furnace with this flue, and if so how would he connect it without tearing it out from top to bottom? This is the nut I wish cracked.

Note.—Here is an opportunity to give some information on chimneys, the need of which is felt by all, and the question can be discussed with advantage.

The Curtis Steam Trap.

The accompanying illustrations show a new form of valve which is now used with the steam trap made by d'Este & Seeley Co. (formerly Curtis Regulator Co.), 29 Haverhill St., Boston, Mass. As will be seen from Fig. 1 the trap, of close grained cast iron, is made very heavy, in the form of a cylindrical pot with rounded ends, a form which experience has shown to be the best shape to resist pressure, being sufficiently strong to withstand a pressure of 250 pounds. A neck or nozzle large enough to admit the float is placed on one side. This nozzle is covered by a strong plate, to which is bolted the composition valve. Should it be necessary for any reason to take out the float and valve it may be done by removing the plate, which brings away with it the float and valve, so that it may be readily examined, repaired or shipped to the manufacturers, should this be necessary, but at the same time it leaves the pot in place and connected.

Looking at the sectional view, Fig. 2, it will be seen that the valve body is provided with strong ears, by means of which it may be bolted to the cover of the trap. The valve itself consists of a loose tube with water ring packing, resting on a Jenkins seat in the cap of the valve and operating endways by the rise and fall of the float. The flow of the water, which passes through the tube and out between the end of the tube and elastic seat, is cut off by the contact of the end of the tubular valve with the seat, while the water line in the trap is still some inches above the outlet. The valve holds tight, even when the end is quite worn, owing to the fact that the seat is a Jenkins and expansible. To remove the valve it is simply necessary to take out the small bolt in its center and draw out the valve with a hook. This valve may be easily turned up in a lathe, in a few moments the seat renewed and the valve made practically new without starting a gasket, bolt or pipe.

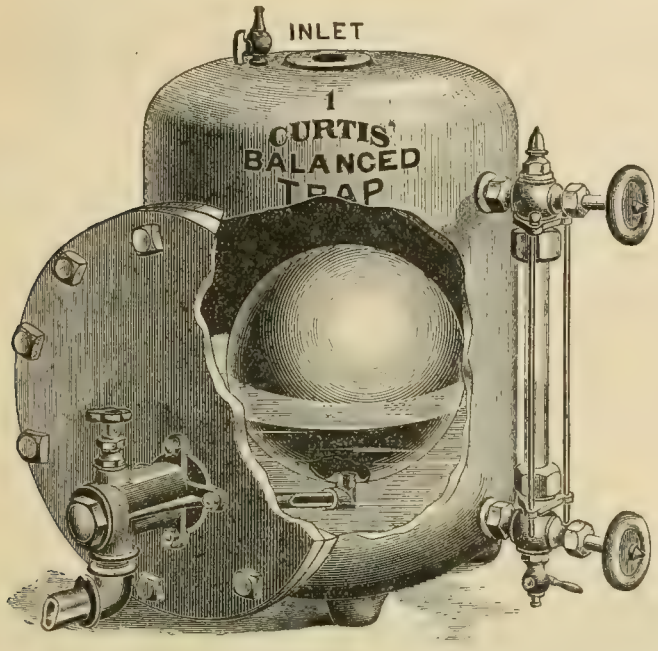

Fig. 1.—THE CURTIS STEAM TRAP.

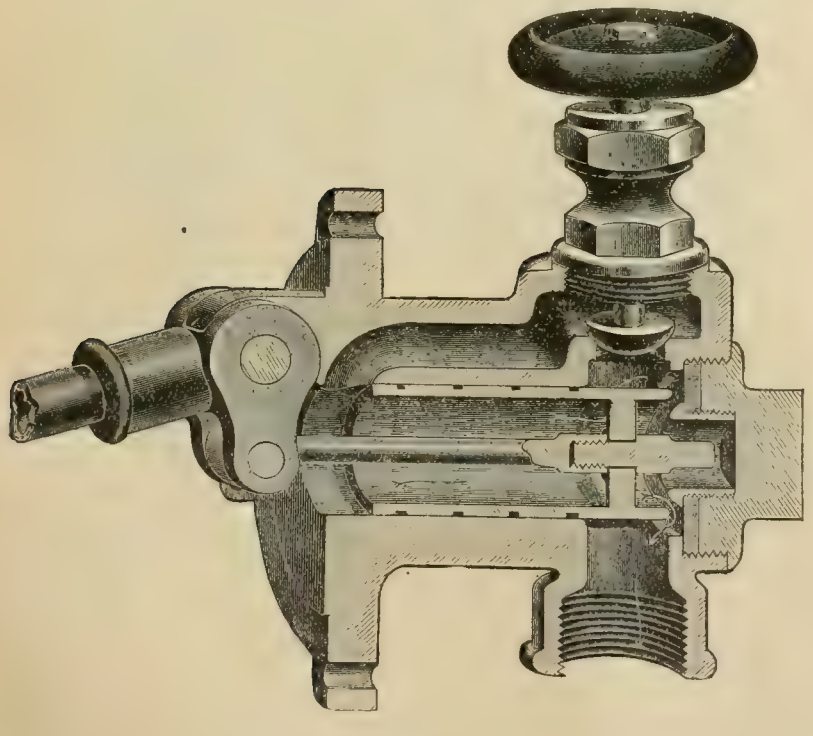

Fig. 2.—SECTIONAL VIEW OF VALVE.

In order that the water may be drained off when the discharge valve is closed, and work continued, the trap is provided with an independent passage or by pass controlled by a stop valve.

The float is made by an original process in which the ball is constantly rotated while the copper is electrically deposited, thus securing an absolutely uniform thickness. It is large, heavy, perfectly spherical, hardened by the rolling process, so that it is hermetically sealed, and will remain tight and strong at a pressure of 200 pounds. Each trap is provided with a glass water gauge so that the amount of water by which the trap is sealed may be seen at a glance. The traps are particularly adapted for use in dry rooms, drying cylinders and buildings, taking care of large quantities of water and delivering it very hot to a tank or returning it to the boiler, and also on stacks of pipe for indirect radiation with or without a blower. They will work against any head pressure less than the direct pressure in the trap. The trap is often used in large plants as a water line trap when there is necessity of balancing any particular circulation, thereby preventing snapping and cracking in pipes and radiators. This may be accomplished by connecting to the top of the trap the direct steam pipe and bringing the return below the water line of the trap.

Senator Chandler of New Hampshire fathered a motion last week in the Senate to instruct the Committee on Commerce to inquire into the expediency of construction, in the near future, of an interior coast line of waterways across the head of the peninsula of Florida, along the coast from Florida to Hampton Roads, between Chesapeake Bay and Delaware Bay and by Cape Cod. The idea is to use in part the vast system of salt-water sounds extending from Chesapeake Bay to Florida, which can at a comparatively small cost be connected by short canals, and so afford an advantageous Atlantic coast waterway, which would be of great commercial and military advantage. Government aid would be required to carry out the project.

From the agricultural statistics lately published we learn that of a total of 8,086,837 acres of cultivated land in the State of Texas, 4,520,310 acres were, in 1892, devoted to cotton and 3,166,353 to corn. The farm products from this area, during the 12 months, were valued at nearly $131,500,000, an increase of $30,000,000 over the returns for 1888. During those four years there was an increase of 13 per cent. in acreage, and of 18 per cent. in the number of farmers. The Lone Star State has been thus steadily increasing her production and adding to her wealth during these years of Southern depression in a most satisfactory fashion, which promises well for her future prosperity.

PLUMBING and GAS FITTING.

New York State Plumbing Law.

The plumbers of this city, and those in the other cities of the State as well, are interested in the statute known as Chapter 620 of the Laws of New York State. This famous law, which provided for the examination and registration of plumbers, was through the efforts of Col. Geo. D. Scott and Mayor Gilroy, superseded by a similar law, extending the time of registration to September 1, 1893, from March 1, 1893. This change of date was made necessary on account of the delay under the former administration in bringing the law into operation. We have many inquiries about the text of this law, and as no copies can be obtained from the State authorities, or elsewhere that we know of, we print it in full, as follows:

An Act to Secure the Registration of Plumbers and the Supervision of Plumbing and Drainage in the Cities of the State of New York.

The people of the State of New York, represented in Senate and Assembly, do enact as follows:

SECTION 1. Within 90 days after the passage of this act it shall be the duty of the Mayor of each of the cities of this State to appoint a board for the examination of plumbers for such city where such board shall act, to be known as the "Examining and Supervising Board of Plumbers and Plumbing," excepting in the cities of New York, Brooklyn and Albany, where it shall be known as the "Examining Board of Plumbers." Such board shall consist of five persons, of whom two shall be employing or master plumbers of not less than ten years' experience in the business of plumbing, and one shall be a journeyman plumber of like experience, and the other members of said board shall be the chief inspector of plumbing and drainage of the Board of Health of such city and the chief engineer having charge of sewers of said city, but in the event of there being no such officers in such city, then any two other officers having charge or supervision of the plumbing, drainage or sewerage whom the Mayor shall designate or appoint, or two members of the Board of Health of such city having the like duties or acting in like capacities. The term of office of the master and journeymen plumbers first appointed under the provisions of this act shall be as follows:

One shall be appointed for one year, one for two years and one for three years, their terms of office to expire respectively one, two and three years from and after the thirty-first day of December of the year in which such appointments shall be made, and the Mayor in making the first appointments shall for each one so appointed specify the duration of the term of office to which he makes said appointments respectively, and annually thereafter upon the expiration of the term of office of any such member of the board his successor shall be appointed by the Mayor for the term of three years, or until a successor shall be appointed, and the Mayor shall have the power to fill any vacancy caused in such Board of Examiners by the death, removal, inability to act, resignation or removal from the city of any member thereof, and such appointment shall be for the unexpired term.

Such Chief Inspector of Plumbing and Drainage, and such Chief Engineer in charge of sewers, or the officers holding equivalent positions or acting in like capacities, designated or appointed by the Mayor as herein provided, shall be deemed to be also *ex-officio* members of such Examining Board, and when they shall cease to hold the offices by reason or on account of which they were so designated or appointed, their successors shall act on the Examining Board in their stead.

SEC. 2. It shall be the duty of such *ex-officio* members of the Board of Examiners to discharge their duties as members of this board without compensation therefor. The master and journeymen plumbers serving as members of such board shall severally be paid at the rate of $5 per day for each day's services when actually engaged in the performance of the duties pertaining to the office, but such compensation shall not exceed the sum of $5 per month in cities of 100,000 inhabitants or less, nor the sum of $10 per month in cities having a population of over 100,000 and less than 300,000, nor a sum of $20 per month in cities having a population of over 500,000.

SEC. 3. All the members of such board shall be citizens and actual residents of the cities in which they are appointed.

SEC. 4. The several Boards of Examiners constituted under this act shall have power and it shall be their duty:

1. *Meetings.*—To meet at stated intervals in their respective cities; they shall also meet whenever the Board of Health of such city, or the Mayor thereof shall in writing request them so to do.

2. *Examinations.*—To have jurisdiction over and to examine all persons desiring or intending to engage in the trade, business or calling of plumbing as employing plumbers in the city in which such board shall be appointed, with the power of examining all persons applying for certificates of competency as such employing or master plumbers or as inspectors of plumbing, to determine their fitness and qualifications for conducting the business of master plumbers or to act as inspectors of plumbing, and to issue certificates of competency to all such persons who shall have submitted to and passed a satisfactory examination before such board and shall be by it determined to be qualified for conducting the business as employing or master plumbers or competent to act as inspectors of plumbing.

3. *Plumbing Code.*—To formulate, in conjunction with the local Board of Health of the city in which it shall act, except in New York, Brooklyn and Albany, a code of rules regulating the work of plumbing and drainage in such city, including the materials, workmanship and manner of executing such work, and from time to time to add to, amend or alter the same.

4. *Fees.*—To charge and collect from each person applying for examination the sum of $5 for each examination made by said board, and all moneys so collected shall be paid over by the board monthly to the chamberlain or treasurer of such city in which said board shall be appointed

SEC. 5. Any person desiring or intending to conduct the trade, business or calling of a plumber or of plumbing, in any of the cities of this State, as employing or master plumber, shall be required to submit to an examination before such Board of Examiners as to his experience and qualifications in such trade, business or calling; and after March 1, 1893, it shall not be lawful in any city of this State for any person to conduct such trade, business or calling unless he shall have first obtained a certificate of competency from such board of the city in which he conducts, or proposes to conduct, such business.

SEC. 6. On or before March 1, 1893, every employing or master plumber carrying on his trade, business or calling in any of the cities of this State shall register his name and address at the office of the Board of Health of the city in which he shall conduct such business under such rules and regulations as the respective Boards of Health of each of the cities of this State shall respectively prescribe, and thereupon he shall be entitled to receive a certificate of such registration, provided, however, that such employing or master plumber shall, at the time of applying for registration, hold a certificate of competency from an Examining Board; but such registration may be canceled by such Board of Health for a violation of the rules and regulations for the plumbing and drainage of such city duly adopted and in force therein, after a hearing had before said Board of Health, and upon a prior notice of not less than ten days, stating the grounds of complaint and served upon the person charged with the violation of the aforesaid rules and regulations; but such revocation shall not be operative unless concurred in by a majority of the local Board of Examiners.

And after March 1, 1893, it shall not be lawful for any person to engage in, or carry on the trade, business or calling of an employer or master plumber in any of the cities of this State unless his name and address shall have been registered as above provided.

SEC. 7. Within 60 days after the organization of such Examining Board in any of the cities of this State the local Board of Health, or the Commissioner or the Commissioners of the Board of Health or the Health Department thereof, as the case may be, shall detail, designate, or appoint for the purposes of this act and the enforcement of the provisions thereof and the work of inspecting the plumbing and drainage of buildings, in said city, an inspector or inspectors of plumbing, subject, however, to the provisions or limitations of existing laws regulating the appointment of inspectors by such Commissioner or Commissioners or Board or Department of Health of such city.

But all inspectors of plumbing so detailed, designated or appointed, and all inspectors of plumbing hereafter appointed, except in New York, Brooklyn and Albany, shall be practical plumbers not engaged directly or indirectly in the business of plumbing during the period of their appointment, and they shall be citizens and actual residents of the city in which they are appointed, and before entering upon the discharge of their duties, as such inspectors, each shall be required to obtain a certificate of competency from said Examining Board. They shall be entitled to receive compensation not exceeding $5 per day for each day of actual service, to be fixed by the board, commissioner or department making such appointment.

SEC. 8. The duties of the inspector or inspectors of plumbing appointed under the provisions of this act, in addition to the duties prescribed by law, and those which may be enjoined or required by the Commissioner of Health, the Board of Health or the Health Department of the city in which they shall be appointed, shall be to inspect the construction and alteration of all plumbing work performed in such city subsequent to the passage of this act, and to report in writing the results of such inspection to the said Commissioner of Health or the Board of Health or the Health Department of their respective cities; they shall also report in like manner any person engaged in or carrying on the business of employing plumber without having the certificates herinbefore mentioned.

SEC 9. All certificates of registration issued under the provisions of this act and all licenses authorizing connections with street sewers or water mains shall expire on the thirty-first day of December of the year in which they shall be issued, and may be renewed within 30 days preceding such expiration, such renewals to be for one year from the first day of January in each year.

SEC. 10. Whenever any inspector or other person reports a violation of any of said rules and regulations for plumbing and drainage, or a deviation from any officially approved plans or specifications for plumbing and drainage filed with any board or department, the local Board of Health shall first serve a notice of violation thereof upon the master plumber doing the work, if a registered plumber. Such notice may be served personally or by mail, and if by mail it may be addressed to such master plumber at the address registered by him with local Health Board; but the failure of a master plumber to register will relieve any Board of Health from the requirement of giving notice of violation. Unless the violation is removed within three days after the date of serving or mailing such notice, exclusive of the day of mailing or serving, the Board of Health may proceed according to law.

SEC. 11. From and after March 1, 1893, the plumbing and drainage of all buildings, both public and private, in each of the cities of this State shall be executed in accordance with the rules and regulations adopted by the local Board of Examiners in conjunction with the Board of Health for plumbing and drainage; and all repairs and alterations in the plumbing and drainage of all buildings heretofore constructed shall also be executed in accordance with such rules and regulations, except in New York, Brooklyn and Albany, where the Board of Health shall have control; but this section shall not be construed to repeal any existing provision of law requiring plans for the plumbing and drainage of new buildings to be filed with any local Board of Health and to be previously approved in writing by said Board of Health, and to be executed in accordance therewith, except that in case of any conflict between such plans and the rules and regulations of the Board of Examiners, the latter shall govern.

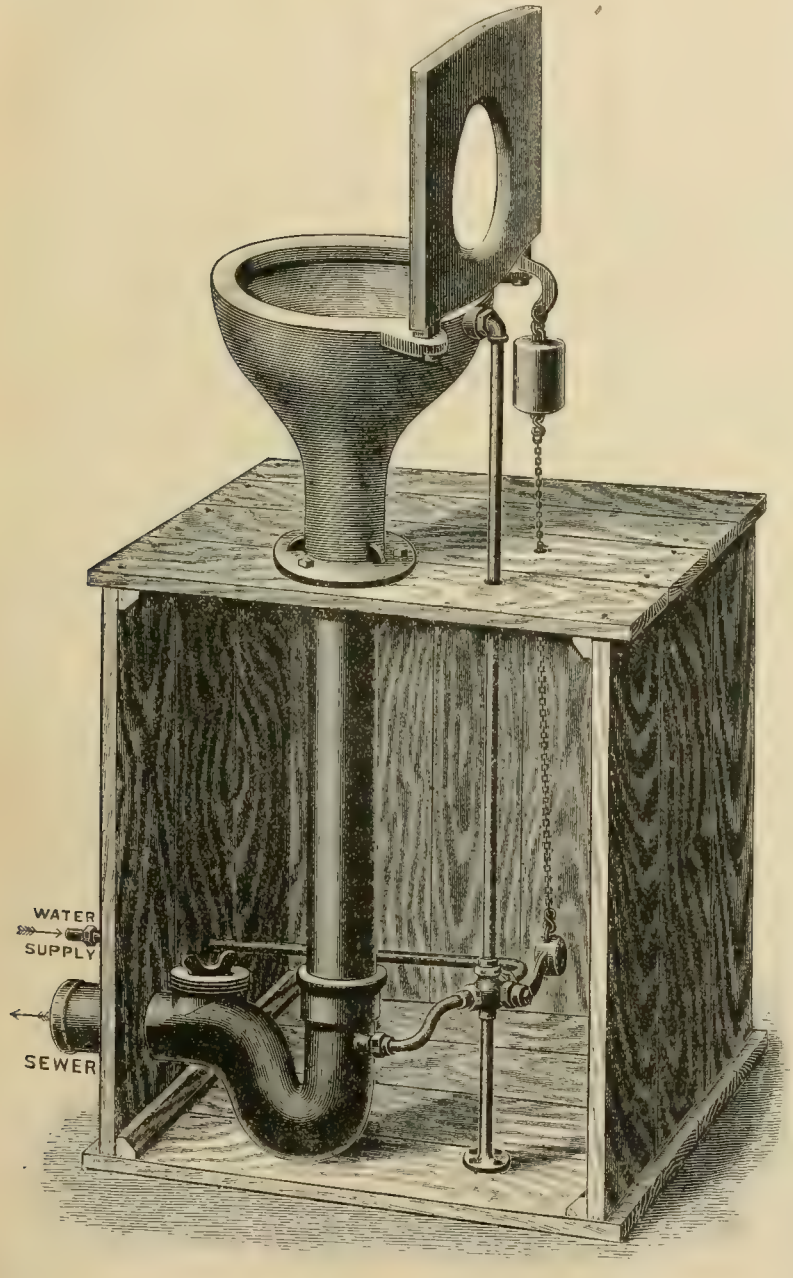
SEC. 12. Each of such Boards of Examiners shall have power to secure suitable quarters for the transmission of business, to provide the necessary books and stationery and to employ a clerk to keep such books and record the transactions of such board. The Board of Estimate and Apportionment of the City of New York and the Common Council of all other cities shall annually insert in their tax levy a sufficient sum to meet the expenditures incurred under the provisions of this act; and all expenses incurred by the several Boards of Examiners in the execution and performance of the duties imposed by this act shall be a charge on the respective cities, and shall be audited, levied, collected and paid in the same manner as other city charges are audited, levied, collected and paid.

SEC. 13. Any person violating any of the provisions of this act or any rules and regulations of the Board of Health or of the Board of Examiners in any city regulating the plumbing and drainage of buildings of such city, shall be deemed guilty of a misdemeanor and upon conviction, if a master plumber, shall, in addition, forfeit any certificate of competency or registration, which he may hold under the provisions thereof.

SEC. 14. After the passage of this act the Commissioner of Public Works of any city, or the officer or officers acting in a like capacity in any of the cities of this State, and having charge of the sewers and water mains, shall not issue a license to any one to connect with the sewers or with the water mains of such cities unless such person has obtained and shall produce a certificate of competency from the Examining Board of such city hereby created.

SEC. 15. All acts or parts inconsistent with or repugnant to the provisions of this act are hereby repealed.

SEC. 16. This act shall take effect immediately.



The Kelly Frost Proof Closet.

The Kelly Frost-Proof Closet.

Thos. Kelly & Bros., 122 Franklin street, Chicago, have invented and are putting on the market the Kelly frost-proof closet, as herewith illustrated. The closet is intended to take the place of privy vaults, and is made ready to put up, as shown in the accompanying engraving. When placing the closet in position it is only necessary to connect the trap with the sewer and supply pipe with the water supply. The operation of the closet is as follows: While the seat is occupied the inlet side of the Kelly hopper cock is opened and the waste end closed. The water runs into the top of closet through the vertical pipe until the seat is vacated, when the weight raises the seat and closes the supply, at the same time opening the waste, which allows the water to drain from the pipe above the valve. The water pressure tends to close the inlet ball, which prevents waste of water and leakage. The Health Department of Chicago have adopted this closet and now compel the abandonment of privy vaults where sewers are accessible.

Chicago Master Plumbers.

The Chicago Master Plumbers' Association, who are well known for their energy in promoting the interests of their organization, have issued a circular letter to the members of the plumbing trade in Chicago, with a view of still further enlarging the membership of the local association. The circular, signed by President T. B. Culloton, begins with an account of the Master Plumbers' Association, from which we quote as follows:

"The first Association of Master Plumbers in Chicago was organized in 1860, represented by 25 firms engaged in the plumbing business, many of whom are now dead, and a few are members of the present Chicago Master Plumbers' Association, which was organized in 1882, for the purpose of establishing a closer business and social relation to one another, mutually benefiting its members by the more thorough understanding and enforcement of principles, rules and regulations for transacting the business of plumbing and protecting themselves by all lawful and honorable means, and to maintain a high and honorable standing among the mechanical industries of the State. How far this association has progressed in the benefiting of the trade, as well as the public, we will investigate. During the last quarter of a century, owing to many causes, among which may be mentioned the introduction of 'manufactured goods' in place of hand-made goods, unfair competition, fraud and dishonesty, irregular labor market, &c., our trade, as a whole, had degenerated until it had (in contradiction of the very general belief) arrived at that point where a business man engaged in plumbing must do one of two things, cheat and defraud, or fail to make a bare living profit."

To remedy this state of affairs, which was of gradual growth, concerted action was taken and the Baltimore resolutions were adopted. In the circular issued by President Culloton a copy of the resolutions is then presented. Following this the circular proceeds to tell what great benefit has resulted from these resolutions in the matter of business prosperity. Returning to the technical part of their trade, the circular proceeds as follows:

"Laws have been enacted in nearly all of the cities and many of the States governing the construction and placing of plumbing fixtures. Here in Chicago plumbing has been advanced remarkably; it is needless for me to go into

details, as you are all familiar with the rules and regulations governing same, all of which has been advocated, introduced and passed by the City Council through the efforts of the Chicago Master Plumbers' Association. There is a great deal more work yet to be performed to elevate our trade. We must do away with our earthen sewer pipe inside of buildings and substitute iron. Abolish the privy vaults where sewers are in adjoining streets and compel water closets to be used instead. A house to house inspection each year, and made compulsory on tenants and landlords to put plumbing in a sanitary condition in keeping with the laws. Examination before licenses are issued and a certificate of qualification given before same is granted. A suitable number of practical plumbers as plumbing inspectors, who will rigidly enforce the plumbing laws. All these, gentlemen, and many more questions, must be put through the Common Council and enacted into laws in order to elevate our trade, which will require the united support of all those concerned. Let the plumbing trade of Chicago be united, let each and every person carrying on the plumbing business be enrolled in the Chicago Master Plumbers' Association, giving support thereby to its officers, and instruct them what work they must perform, and back them up with all your force and main in order to place the plumbing trade in the highest plane of usefulness, unsurpassed by any other business in the land."

Clambake of the New York Master Plumbers.

A generous representation of the Association of Master Plumbers of New York took the 8.45 a.m. train at the Grand Central Depot for the Rhode Island clambake, at Rye Beach, N. Y., on Tuesday, August 29. The affair was in charge of a committee composed of Joseph W. O'Brien, James N. Knight, Henry J. Pattison, Henry G. Gabay and Alexander Bryant, who acted as treasurer and issued the invitations. The early portion of the day was spent in social and athletic enjoyment. In the game of baseball the trap for the ball was not always sealed, which gave free vent to hilarity.

All had a jolly time, and by 4 o'clock, when a charge was ordered on Betz Hotel, at the grove, there were no stragglers. Not the least pleasant of the diversions was the entertainment prepared by the committee. The officers of the association, President Henry G. Gabay, Vice-President Thomas J. Tourney, Recording Secretary Henry J. Pattison, Financial Secretary Thomas J. Cummins, Treasurer James N. Knight, Marshal Thomas F. Gaynor, and Sergeant-at-Arms Charles Schlosser, rendered yeomen's service in attending the members and their guests. Among the guests were several of the city officials: Col. Geo. D. Scott, Louis A. Hornum and Henri D. Dickinson of the Bureau of Plumbing and Ventilation, Nicholas R. O'Connor, Frank Vanahan, Geo. Hackett and J. Campbell of the Department of Public Works, and Major W. Bullard and A. Lucas of the Board of Health, and J. E. McGovern, John McKenna and John Crowley from the Journeymen Plumbers' Association. No time was left for speech making after the good things disappeared, but some of the good things that will not vanish are the prizes that are yet to be awarded to the winners of the contests.

THE DIFFERENCE between the master plumbers and the journeymen at Norfolk has been satisfactorily adjusted.

Trap Ventilation.

We have the following communication from Wm. Paul Gerhard of New York:

In the paper entitled "A Review of Recent Plumbing Practice," read by Mr. Glenn Brown, P.A.I.A., at the World's Congress of Architects in Chicago, and reprinted in a recent issue of your journal, Mr. Brown asserts that "I practically avoid in my works the question of trap ventilation."

This statement is erroneous and misleading and shows that Mr. Glenn Brown has either not read my books carefully or else that he has not taken the trouble to understand correctly the opinions expressed by me regarding the "back airing" of traps.

It is, in my judgment, only a question of time when all plumbing regulations will be so changed as to leave it optionary with the owner or architect of a building whether to "back air" his traps, or to adopt the much simpler and safer system of non-syphoning traps.

I have, as early as 1884, gone on record as being opposed to any useless and expensive system of trap ventilation, and have since then repeatedly asserted my belief in, and preference for, non-syphoning traps and a simpler plumbing system.

On page 123 and following of my book "Hints on the Drainage and Sewerage of Dwellings," published in 1884, I expressed my opinion regarding trap ventilation, as follows:

"While admitting that such air pipes render S-traps practically safe against most of the above-made objections, it cannot be denied, on the other hand, that they largely increase the cost of plumbing in dwellings, especially so where fixtures are much scattered throughout the house.

"1. They complicate the work and are difficult to run in old buildings, and must be largely increased in the case of high buildings toward the upper floors.

"2. They increase the evaporation of water in traps, and therefore aggravate the danger from sewer gas entering through fixtures in cases where these remain unused for a long time.

"3. It is quite possible that vent pipes stop up in time at the crown of the trap with splashings from soapsuds, when they will cease to furnish air to break the vacuum. Unluckily, such fact would not reveal itself and is not easily detected, nor is much known at the present time about this point.

"The literature on this subject has been lately enriched by numerous careful and valuable experiments upon the syphonage of traps made by Col. George E. Waring, Jr., assisted by the writer, by Edward S. Philbrick, C. E., and Ernest W. Bowditch, C.E., of Boston; by S. Hellyer of London, England; Dr. Lissauer of Dantzic, Germany; Dr. Renk of Munich, Germany, and others.

"The results of the first-mentioned experiments are greatly at variance, and seem to indicate that while in some cases traps need a strong protection against syphonage, in other cases, especially where the soil and waste pipes have ample ventilation and branch wastes are very short, such protection is not required. At any rate it is too early yet to establish rules which apply to all cases. *It has always seemed to me as if it would be feasible to practice a wise discrimination.*" (The italics are not in the original.)

"Where a fixture is located remote from a vertical pipe, and consequently discharges through a long run of waste pipe, which would otherwise form a 'dead end,' it is positively necessary to run a vent pipe from the crown of the trap upward to the outer air, which prevents in the first place a stagnation of air, and at the same time stops syphonage; and this is true of any kind of trap, not only of the class of traps known as S-traps. It should apply to mechanical traps as well.

"If, on the other hand, such fixture is located quite near to a vertical thoroughly ventilated soil pipe, or a well-ventilated horizontal run of pipe, I should not hesitate to place under the fixture a trap which is not easily syphoned, leaving out the air pipe if there is no vent pipe near by to connect to. Such a course seems especially desirable in the case of high buildings for single fixtures in basements, or on lower floors. For instance, a 1½-inch sink trap in the basement of a flat, such as is now being erected in New York City, 200 feet in hight, would require an air pipe at least 3 or 4 inches in diameter to prevent syphonage, the friction in a 1½ or 2 inch pipe 200 feet long being too great to allow the air to enter quickly enough to break the suction. I would consider it foolish extravagance to use such long length of pipe of such large size for the trap of only a single sink. If a non-syphoning trap could not be made to answer the purpose, the only sensible course to pursue would be to abandon such fixture entirely.

"I must further say that it seems to me dangerous to use vented S-traps with the usual water seal of only 1½ or 2 inches under bowls or tubs in spare or guest rooms of large city residences, and for such dwellings generally that are occupied only a part of the year. This danger is generally disregarded or passed over lightly by enthusiasts for 'back-air piping.' My personal preference in such cases would always be for a non-syphoning trap, with a water seal which does not so easily evaporate, or for a non-syphoning trap with a mechanical seal against gases from the soil pipe, and where rules of local Boards of Health would demand such an air pipe under such conditions, I should probably advise the use of a tight-shutting stop valve on the waste pipe,* and combined with it an arrangement for simultaneous shutting off the hot and cold water supply to the fixture, so as to render an overflow impossible. I am quite ready to admit that the latter arrangement would tend to complicate the plumbing work, but, I think, everybody must concede that, under the conditions mentioned, it would be safer than a vented S-trap with usual slight seal."

In my work, "House Drainage and Sanitary Plumbing," second edition, published in 1884, I expressed a similar opinion, as follows:

"It is always costly and often very inconvenient to run vent pipes to the roof. The plumbing work is greatly complicated and the number of joints which may leak sewer air greatly increased by trap ventilation. There is also danger that the vent pipes for traps under tubs, sinks and bowls may stop up with soapsuds or grease, in which case they would cease to act properly. The continuous current of air in the vent pipe in passing over the water in the trap undoubtedly increases its evaporation. Finally, it becomes necessary, in the case of high buildings, largely to increase the diameter of vent pipes, in order to make up for the loss through friction necessarily occurring with long air pipes. Therefore, while I consider vent pipes for traps a necessary evil in many cases, especially for water-closet traps, I am inclined, in other cases, to prefer a good non-syphoning water-seal or mechanical

* Such a combined trap and shut-off valve is now obtainable in the market.—W. P. G.

trap, provided the soil and waste pipe system has ample ventilation. Such a mechanical or anti-syphoning trap may be used under sinks, tubs and bowls, but for water closets and slop hoppers (if without a strainer) the simple lead water-seal trap, with vent attached, is the only safe device." †

In an article published in the Chicago *Inland Architect* in 1885, and subsequently reprinted in 1887 in my book, "Recent Practice in Sanitary Drainage of Buildings," I stated as follows:

"Experiments have established with a sufficient degree of certainty the fact that the self-cleaning S, P, or running traps cannot be depended upon always to retain their water seal against syphonage, unless air is admitted at the crown and sewer side of the trap, either by some anti-syphoning trap attachment or by a so-called 'back-air' pipe of ample size. Consequently, I should not use such traps without providing such protection as the remedies mentioned afford. Later experiments have shown that an air pipe is not a reliable protection against syphonage in all cases, especially where the course of the air pipe is long and tortuous, and that where fixtures are not in constant use, it furthers the evaporation of the water in traps, and hence endangers the safety of plumbing work. That it increases the cost of plumbing and hinders simplicity of arrangement must be conceded by all. Thus, while it offers certain advantages in some instances, there are other cases where the disadvantages predominate. It remains, then, to be decided, only after a thorough and intelligent consideration of all conditions, whether a seal retaining water-seal trap safe against back pressure, syphonage or other influence, or an anti-syphoning trap attachment of some kind, may not be preferable."

In an article on "The Drainage of a House," published in Boston in 1888 and subsequently reprinted in 1890, in the second edition of the book "Recent Practice," &c., I stated:

"From my best knowledge and belief I cannot accept as universally necessary the requirement of 'back ventilation' of traps. . . I do not fail to explain to my clients that the back airing of traps is done at the expense of simplicity; that in a properly laid out system trap vent pipes are not necessary to prevent dead ends in short lateral waste pipes, and that prevention of syphonage can be accomplished and the extra cost incurred by using back-air pipes be saved in all but rare instances by adopting simple and well known devices.

"Where I am compelled to run back-air pipes, complicating the pipe system, it is always my endeavor to modify the arrangement so as not to expose the water in the trap too much to the air current; for there can be no question that the thereby increased free circulation of air in the vicinity of the sealing water of traps hastens the unsealing, by evaporation, of traps under fixtures which remain unused for some days in succession and endangers the security of all traps during any period when a house is left unoccupied."

The above quotations must convince any unprejudiced person that I am not a blind believer in trap ventilation. They will also suffice to refute the careless assertion of Mr. Brown, that I avoid the question of trap ventilation.

† The many forms of excellent syphon and syphon jet closets now obtainable are constructed with a very deep and effective trap seal, which does not require a vent pipe when the piping is properly arranged.—W. P. G.

TRAPS AND VENTS.

C. L. Burg is occupying his handsome brick building on Seventh avenue, Clinton, Iowa, with his plumbing establishment.

The Board of Health of the town of Beverly, Mass., have appointed Dr. Geo. A. Stickney, D. S. Ingersoll and Robert Robertson a board for licensing and supervising plumbers. The board are at work on a set of regulations that will be presented to the Town Council for adoption.

The Master Plumbers of Albany, N. Y., recently enjoyed a jolly clambake at the Abbey. All of the city officials were invited and the architects, beside many other dignitaries. A ball game, foot races and other sports entertained the guests while the feast provided by the committee in charge was being prepared. Provender was plenty and the consumption cleared both the tables and the minds of the committee of any burden they may have carried. The officers of the local association are: Thomas Hyde, president; Horace T. Westcott, secretary; John Moran, treasurer, and Frank Schimpf, financial secretary.

At a recent meeting of the local union of plumbers and roofers at Albany, N. Y., a number of the master plumbers were present, witnessing the installation of the new officers, who are: M. J. Quinn, president; Daniel Powers, vice-president; John J. Burn, secretary; H. H. Derouvel, recording secretary, and John Roach, treasurer.

The Atlantic Plumbing Company, at Atlanta, Ga., are about to be incorporated, with a capital of $5000, for transacting a plumbing, gas and steam-fitting business, with J. A. G. Beach, M. A. Beach, Allie Wingate, and A. R. Butcher as the petitioners for the charter.

S. W. Holman & Co., plumbers, at Durham, N. C., are about to erect for their business a building 36 x 65 and three stories high.

The Springfield, Mass., Master Plumbers' Association held a meeting in the Board of Trade rooms, August 28, and elected H. G. Briggs treasurer and D. D. Casey secretary. Both offices were held by F. W. Tower, who resigned when he took the position of plumbing inspector. John G. Howland was appointed a committee of one to make arrangements for a clambake to be held near the Watershops pond, September 8.

The stock and plumbing shop of Edward Farley, 68 Greenpoint avenue, Brooklyn, N. Y., was recently damaged by fire.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

Plans for the proposed sewerage system at Macon, Ga., are being prepared by Samuel Gray of Providence, R. I., the estimated cost being about $6500 per mile and about three years will be necessary for laying the 36 miles proposed.

H. E. Bottum has secured the contract for heating the new Island School at Albany, N. Y., at $800.

In the new shoe factory at Ipswich, Mass., M. B. McLaughlin of Lynn did the steam fitting.

A letter from W. J. Goff apprises us that Goff & Taylor, Malone, N. Y., have nearly completed the work on a $7000 sewerage system that they are putting in at the village of Saranac Lake, N. Y. They also have the contract to put in a system of water works at the same place to cost $20,000.

Contract for putting a Richmond steam heater in the High School Building at West Brookfield, Mass., has been awarded to W. A. Putnam of Warren.

The plumbing work in the new shoe factory at Ipswich, Mass., was done by George Sleeper & Co. of Lynn.

The Carman Thompson Company, Rumford Falls, Maine, have recently completed the plumbing work in the office of the Rumford Falls Paper Company and in the new residence of Judge Morrison. The work was done by their foreman, Charles Mobb, and is said to be the finest in the State. The fixtures were all silver plated.

McCullough Bros., Bridgeport, Pa., were recently awarded three steam heating contracts.

John W. Mills, 100 Lake street, Chicago, has the contract for removing the steam heating plant in the St. Joseph Convent, Milwaukee, and substituting five No. 20 Bolton hot-water boilers. There will be about 11,000 feet of radiation used in the building.

The Smith & Anthony Stove Company, proprietors of the Sanitas plumbing specialties, are to furnish through their Chicago branch, 219 Lake street, J. A. Cunningham manager, 37 Sanitas closets and 175 Sanitas traps for the Old Colony Building at Dearborn and Van Buren streets, Chicago.

The toilet rooms in the stations of the Chicago Metropolitan and Lake street elevated railroads are to be wainscoted with Italian marble and furnished with the Wade flushing washbowls, improved basin cocks and syphon jet closets. All exposed work is to be nickel plated, and the sewer, soil and waste pipes are to be ventilated in the most thorough manner. The plumbing work in these stations is to be done by J. J. Wade & Son, 298 Dearborn street, Chicago, who have also contracts for the plumbing in the Old Colony Building, Boyce Building, Watson Building, Kedzie Building, Newberry Library and others. The same firm are also overhauling the plumbing in the Pullman Building and putting in the Wade sewer flushing system.

Howell, Shanklin & Dowman, Charleston, Kanawha County, W. Va., report an excellent run of business during the month of August, among the jobs being the steam heating and plumbing for the Kanawha Valley Bank Building at a price of $4160; steam heating for the Kanawha National Bank Building, $1150; four hot-water heaters for dwellings aggregating $2400. For these and other jobs the firm are now in the market to buy nearly 10,000 square feet of direct radiation for steam and hot water.

E. J. Brady of New York is putting a No. 5 Mahony steam boiler in one of Dennett's restaurants at Philadelphia.

Some of the plumbing contracts that are now being filled by Macdonald & Co., 296 Third avenue, New York, are the John L. Downey Building, at Pine and Front streets and the Home Life Insurance Building, at Broadway and Warren streets, which will have the Durham screw-joint pipe system of drainage. Cast-iron pipe will be used in the Bowery Savings Bank, at Bowery and Grand streets and at the addition to the Buckingham Hotel, at 615 Fifth avenue.

Jas. Holland has secured the contract for the plumbing in the new jail at Watseka, Ill.

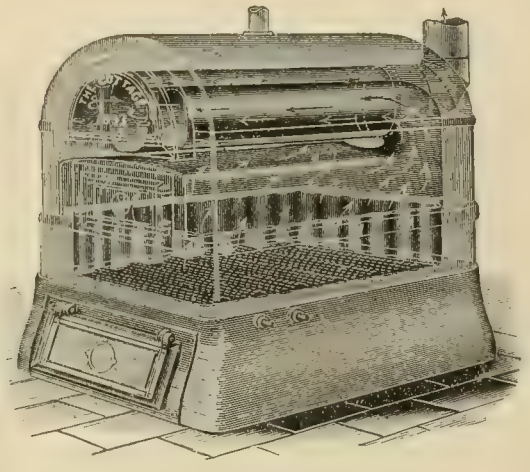
STEAM AND HOT WATER.

The Etna Combination Hot-Air and Hot Water Heater.

A circular from Wood, Bishop & Co., Bangor, Maine, shows their Etna furnace and their method of combining hot air and hot-water heating. A brief description says the fire pot is made in two parts, and the upper part being hollow makes the water chamber. This location exposes it to the full effect of the fire. The water enters the water heater and passes around to the opposite side, becoming heated and ready to pass off through the pipes to the radiators. By the insertion of this device rooms located at a distance from the heater to the north or west can be thoroughly warmed. A lever working draw-center grate reduces the labor of attending the fire and prevents dust, as the ash door need not be opened. Above the fire pot is a wide expanse of surface for heating air and so arranged as to utilize the heat of the gases. The drafts are so arranged that they can be opened or closed to any desired extent from an upper room. A novel arrangement of having a water pan inside and outside of the furnace casing and connected at the bottom avoids the probability of the supply becoming exhausted unnoticed and is convenient to replenish when it does. A number of letters expressing satisfaction with the heater in use is a feature of the circular. The Etna is made in six sizes, Nos. 3½, 4, 4½, 05, 5 and 6, and the claim is made that either examination or practical test will discover a first-class heating apparatus.

The Cottage Boiler.

Our illustration shows a new boiler that is being placed on the sample floors of the H. B. Smith Company, 133–137 Centre street, New York, and for which they were granted patents June 6, 1893. The three different sizes are painted red, white and dark brown, and enlivened by gilt stripes they present an attractive appearance. The boiler is complete in three sections. The ash-pit section is deep, and contains a Reed grate, which consists of a bar supporting a series of disks. The ends of the first two grate bars extend through the ash pit on the right-hand side, and as every alternate grate bar is connected with these two, a lever used on first one and then the other agitates the entire bed of the fire. The ash door is arranged to lift when attached to a lever operated by a draft regulator. A water section rests on the ash pit and forms the fire chamber, being a hollow square with the feed door at the front. At the back it is tapped to receive the return pipe at two points, and the inner surfaces are corrugated to present a larger surface to the fire. This section is connected to the dome section, which rests on it, by wrought iron push nipples at four points, forming a connection that, it is claimed, is at once strong and durable. The dome section is a novel construction cast in one piece through ingenious core work and foundry skill. It is a hollow casting with an arched roof and covers the fire chamber entirely, with two openings at the back which lead into oval flues which run to a chamber at the front, from which a central return flue runs to the smoke outlet at the back. This section might well be termed a tank over a fire with heating pipes running through it. The smoke and gases passing through the flues impart their heat to the water before they escape. A door at the front opening into the flue chamber enables them to be readily cleansed. In the top of the dome section are two openings tapped for the flow pipes. The grate surface is respectively 16 x 16, 16 x 20 and 16 x 24 inches, and the capacity is rated at 250, 325 and 400 square feet of radiating surface.



The Cottage Boiler.

A New Business Plant.

On completing his new storerooms, machine shop and pipe warehouses at 452–454 and 435–437 Water street and 187–189 Cherry street, Edward F. Keating issued from his office, at 75 John street, New York, invitations to the trade to inspect the plant.

On Tuesday, August 29, the manufacturers and jobbers of goods used in fitting for steam, water, gas and oil were received. The head of the house, E. F. Keating, was aided in dispensing hospitality by his genial corps of assistants, J. T. Keating, manager; Henry Currier, F. H. Fairweather, Wm. Smith, Wm. Campbell, John Hogan and Superintendent Thomas McGrath. Among the guests present on Tuesday were Mr. Knight of Knight & Jillson, Indianapolis; Mr. Kelly of the Kelly & Jones Company of Pittsburgh; J. B. Murphy of the Crane Company, Chicago; Mr. Wells of Wells & Coutan, Fred. Rogers of H. A. Rogers, Mr. Richards and Mr. Pancoast of Pancoast & Rogers, New York. No difficulty was experienced in locating the plant, as a substantial, freshly renovated and newly painted brick building, 55 x 120 feeet, of six stories and a basement, was conspicuous fronting on Water street and extending through to Cherry street. On the opposite side of Water street, a few doors below, is the pipe storehouse. A half circle made by slitting lengthwise a piece of A. M. Byers & Co. full-weight 20-inch pipe extends across all three of the street fronts and is painted black, bearing in large letters "Edward F. Keating," with the words "Full weight" at each end. This makes an attractive sign and brings into prominence the full-weight pipe, which is made a specialty. Smaller signs at each side of the entrances state that everything is furnished that is required for fitting steam, water, gas and oil systems.

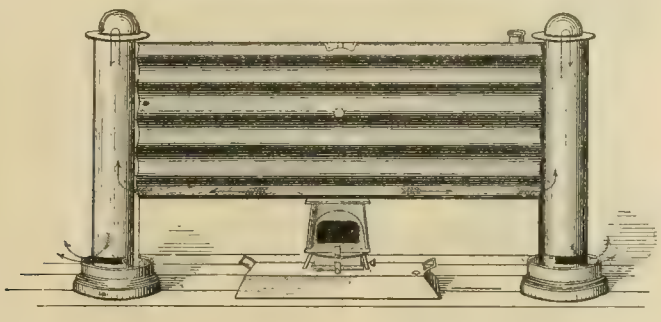
At the pipe storehouse, which is 50 x 130 feet, pipe from ¼ inch to 12 inches is stored. The building is divided into two long, narrow sections and a system of traveling cranes is used, operated by electricity from the main plant, by which one man can load or unload a truck with the largest size of pipe. At the main building the basement is fitted up according to plans perfected by Mr. Keating from his experience with what is necessary in a pipe machine shop. The tools consist of a lathe, two drills, two tapping machines, ten 2 inch, two 8-inch, one 12 inch and one 16-inch D. Saunders' Sons latest improved pipe-cutting machines. In the shop is a system of overhead trolleys and switches that takes the material from the point where it is received to any or all of the machines in the shop. Pipe bending, radiating coils and all pipe work is done here and a plant for testing the work under pressure in used to prove its tightness. A 110 horse-power Hewes & Phillips' engine is used to furnish power and to drive a dynamo for lighting and running the pipe storehouse traveling cranes. An elevator at each end of the building furnishes transportation. On the first floor, at the front, is the superintendent's office and salesroom, the balance being used for a well-arranged system of bins for storing brass goods. The second floor is used for storing pipe fittings, malleable, cast and galvanized, the variety carried overflowing to the third floor. Some idea of the variety and quantity of stock carried may be obtained from the fact that the bin for storing 1¼-inch tees

holds 11 barrels, and that fittings, flanges, valves, &c., can be furnished for pipe up to 20 inches. The fourth floor is devoted to steam traps and kindred sundries.

The fifth will never be devoted to any more pleasing supplies than were found by the guests, a repast that was the more appreciated as it was unexpected. The lubricants were of the anti friction character, and a smoke was furnished that cleared away in fragrance without any damage being done. The guests enjoyed a view of the East River and the lower bay from the sixth floor, which is as yet unoccupied except by good wishes and congratulations left by them. On Thursday, the 31st, the steam fitters and other customers of the house were entertained with the same liberal hospitality, and notable representatives of the craft were present.

English Individual Radiator.

To one of our foreign contemporaries we are indebted for the accompanying illustration of what is termed the



English Individual Radiator.

Little Samson hot-water heating apparatus. The description of the heater in our exchange is altogether inadequate, so our readers must rely upon the engraving for an idea of the article. Such information as is given, however, we reprint. The radiator is described as simple in construction, composed of two sheets of corrugated metal placed together so as to form a water space between them. This horizontal waterway is fixed over the burner of a lamp or gas jet and becomes heated and retains the heat so long as the lamp or gas is kept burning. The illustration shows the course taken by the products of combustion, which pass along a channel under the radiator, up the side pillars and then down again into the room. The apparatus is made for both lamp and gas flame to do the heating, the illustration herewith showing the lamp construction.

HEATING NOTES.

Among the other things exhibited at the World's Fair at Chicago by Abendroth Bros., New York, is the Andrus water heater, which excites considerable interest, resulting in daily inquiries by mail for additional information.

The Portland Foundry & Machine Works have purchased the foundry stock of the Dirigo Heater Company of Portland, Maine. The Dirigo Heater Company have given up foundry work as a specialty and will confine themselves solely to turning out their special branch in the heating line.

The Fuller & Warren Company, Troy, N. Y., issue a pamphlet relating to their hot-water and combination warm-air and hot water heaters. The volume is a neat publication of some 70 pages and begins with a general account of hot-water heating, its advantages over other systems of warming and the notable features in the Fuller & Warren Company apparatus. Proceeding to the catalogue proper there is given at first a description of the Fuller & Warren Company hot-water heaters Nos. 250, 300 and 350, with double section and single section with galvanized casing. Then come broken views of the separate sections, after which are given illustrations with descriptive particulars of their hot-water heater No. 17. In an early part of the book are sectional views of residences and houses, showing the application of the Fuller & Warren Company apparatus to the warming of dwelling houses. Later on cuts are given showing the hot-water heaters Nos. 12 and 15 as applied to laundries, greenhouses, conservatories, &c. At the end of the pamphlet their combination warm-air and hot-water heater is described, the volume closing with a long list of testimonial letters. A supplementary page, arranged to be torn out, contains blanks for estimate of heating.

Nason Mfg Company, 71 Beekman street, New York, manufacturers of iron pipe, fittings, and specialties for steam and hot-water heating, report an exceedingly good season's business in their line. Their sales have exceeded those of last year, notwitstanding the prevailing depression in trade.

A fine display of radiators is made in the showrooms of Mulhern, Piatti & Kirk, 144 East Forty-second street, New York. They are selected from different houses, the A. A. Griffing Iron Company being represented by the Bundy, Renaissance, Bundy Elite, Bundy and the Pyro wall radiators. Those selected from the line of the American Radiator Company are the National, National single column, Detroit, Perfection, Ideal and Ideal box base direct-indirect radiators. The Union and Royal Union radiators represent the H. B. Smith Company. In the many different colors of bronze and other colors used in decorating the radiators a very handsome effect is produced, and a customer of æsthetic taste can be gratified.

F. W. Lamb & Co., manufacturers of steam heating apparatus at 258 Michigan street, Chicago, made a voluntary assignment in the County Court on the 25th ult. August Kehm was appointed assignee to take charge of the firm's property, and assets were scheduled at $50,000, with liabilities of $32,000. The failure is attributed by the attorney for the assignee to the dullness of trade and slowness of collections. An effort will be made to resume business by agreement with the creditors.

The Perfection Radiator.

We show in the accompanying illustration a general view of the new radiator which has just been put upon the market by Levi Hey & Co. of 311 and 313 State street, Rochester, N. Y. The construction of the device is referred to by the manufacturers as being very simple, consisting as it does of two drums connected by a series of vertical pipes. The latter are kite-shaped in cross section, which admits of their being arranged in a cluster or group, as indicated in the engraving. Space is thus utilized to good advantage while the radiating surface resulting is large. The pipes are placed with the narrow portion inward, which compels the hot air to seek the larger area, bringing it to the outside surfaces. The pipes are connected to cast-iron heads

The Perfection Radiator.

by fitting over raised flanges, and are held together by a rod passing through the center. The manufacturers state that they now place a drum over another raised flange on the opposite side of these heads, and then a second cast-iron head on the other end of the drums, making both ends of the radiator alike. The cast-iron heads are held together by three bolts, those used in connection with the lower heads passing through for the purpose of holding the feet of the radiator in place. The end heads are provided with collars to fit the different sizes of pipe, so the hot air passing from the smoke pipe through the lower end head enters the lower drum, then divides, and, passing through an opening in the next head, enters the pipes and so on through them to the top drum, thence to the top head and finally escaping to the smoke pipe. The radiator here shown is known under the name Perfection, and it is claimed that when attached to the smoke pipe just back of the stove the efficiency of the latter will be largely increased. Reference is made to the economy resulting from the employment of the radiator and to its constantly growing popularity with the trade.

THE RETAIL STORE.

Rochester Lamp Stoves

The illustrations herewith show some new heating and cooking oil stoves just being put on the market by the Rochester Lamp Company, 42 Park place, New York. All of these stoves are an adaptation of the well-known Rochester lamp, consequently have all of the advantages resulting from a seamless brass oil tank, the central draft tube, the perforated cone burner, the circular wick and the Rochester draw bar or wick lift. Fig. 1 shows the Rochester parlor heater, which is made from the mammoth fount lamp, with its chimney and all just as it would be lifted from a bracket or pennant and set in a handsome orna

Rochester Lamp Stoves.—Fig. 1.—General View of Parlor Heater.

mental fret work nickel shell base. The latter has handles for carrying when necessary. At the base of the chimney is a brass perforated plate, to receive the Russia iron body, which is perforated at the top and bottom and finished with an ornamental top. In operation the air passes in the lower openings and is heated in its passage between the hot glass chimney and the casing, when it is discharged into the room, which is warmed by the circulation of the heated air. The top is so arranged that it can be removed and any ordinary boiling or cooking done. This stove is 31 inches high and weighs 9 pounds. Fig. 2 shows the Rochester No. 3 oil stove, with heater, which is one of the maker's best lamps. It can be taken from a bracket and set in a handsome nickel-plated cast-iron base and still be used as a lamp. It may, if so desired, be

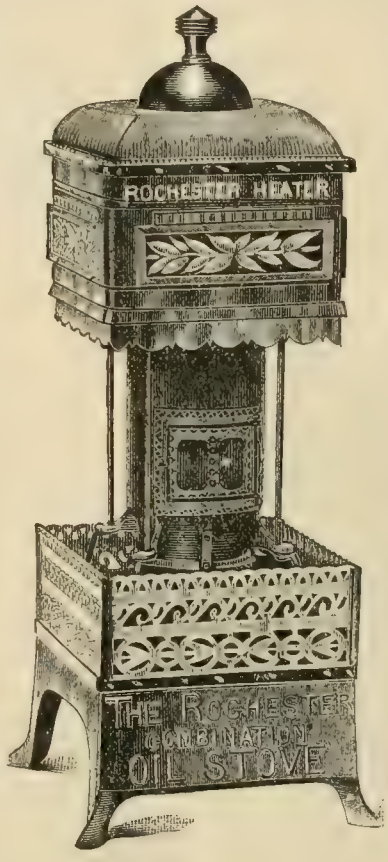


Fig. 2.—Rochester No. 3 Oil Stove, with Heater.

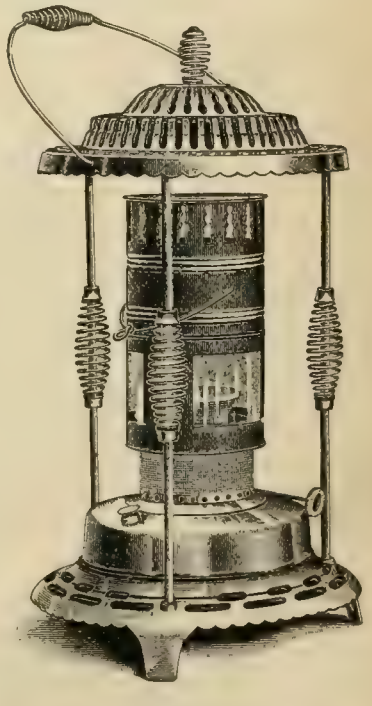
divested of its glass chimney and the Russia chimney and stand substituted,

Fig. 3.—No. 2 Rochester Lamp Stove.

when the ornamental heating attachment, or an oven for baking, can be set in place. Or, dispensing with these, ordinary boiling and cooking can be done. The oil tank in this stove and the one described above each hold 1 gallon, which is said to last ten hours when running full. Fig. 3 shows the Rochester lamp stove, which also has a brass tank and is constructed on the Rochester principle. It can be used as a lamp, or the chimney can be removed and the cooking stand used, as shown in the cut. It is claimed that the combustion is of a character to generate a great heat and to be entirely free from smell. The company have a fine half-tone engraving of their exhibit at the World's Fair, where they are giving out a small four-page card showing a half-tone engraving of a nook in the bridal chamber at the Hotel Waldorf and one of the apartments that were occupied by the Duke de Veragua, both of which show that Rochester lamps are used for lighting. On the back of the card is a number and "Keep this card and watch the number, as it may draw the Rochester prize lamp shown at our exhibit at the close of the Columbian Exposition."

Ladies' Delight Oil Heater.

In the accompanying illustration we present a view of a new oil heater which has been placed upon the market



Ladies' Delight Oil Heater.

by Page Brothers & Co. of 227 and 233 Cambridge street, Boston, Mass. This stove, it will be observed, is of novel design and construction, and is fitted, among other things, with patent central draft burner, giving great heat and making the stove powerful in operation. The arrangement of parts is such that the oil in the tank always remains cool, and the makers state that the burner does not smoke or smell. The rods supporting the top and base, it

will be observed, are provided at their middle points with spiral wound nickel-plated wires which serve as handles, while the bail at the top permits the stove to be readily carried from place to place. The Ladies' Delight is trimmed with nickeled parts in a way to render the stove very attractive.

J. B. SHANNON & SONS of Philadelphia, hardware dealers, are again to be found at their old stand, 1020 Market street, the damage occasioned by the fire in April last having been repaired sufficiently to allow of a reopening. Since the fire their business has been conducted at 919 Market street.

WORLD'S FAIR NOTES.

The Merrell Mfg. Company

of Toledo, Ohio, make an exhibit of their pipe-cutting and threading machinery in Machinery Hall, Section 13, Columns I and J, Nos. 40 and 41. Here they have installed specimens of their Nos. 12, 9½, 6, 4, 2 and 1 machines, all of which are shown in actual operation. The machines are specially designed to meet the wants of steam and gas fitters, erectors of heating, lighting and power plants, pipe-line service and general machine shops. The No. 12 machine is the largest they manufacture, and has a range from 2½ to 8 inch pipe inclusive. It is designed for heavy service, having a quick opening and closing die head, with a convenient cam movement and improved cutting-off knife. The cones are placed centrally over the machine, thus equalizing the weight and placing the belt in the most convenient position. Within the cones are compound gears which give six changes of speed. The vise is self-centering and feeds the pipe into the chasers by a friction universal lead screw connecting the vise frame to the die head by a cam closing the lead nut on the screw. A reverse movement of the cam releases the lead nut, or the pipe can be fed into the chasers by the hand wheel. The No. 9½ machine takes from 2½ to 8 inch pipe, is so arranged that either hand or power can be used at will, or the machine can be readily taken from its base and used as a hand machine. The No. 6 machine is a portable hand threading and cutting machine with an adjustable quick opening and closing die head and an improved cutting off knife. It takes from 1 to 6 inch pipe inclusive. With it one man can cut and thread a 6-inch pipe. It is operated either by a ratchet lever or a crank. The No. 5 is a hand machine taking from 1 to 4 inch pipe inclusive. The No. 2 is a hand or power machine, with a range from 1 to 4 inch pipe, and the No. 1 is also for hand or power, but covers a range of ¼ to 2 inch pipe. These machines are specially noteworthy for their compactness, perfectly housed and journaled gears, their ability to cut true threads on uneven pipe, their great range of sizes with but one set of chasers, the convenience with which chasers can be changed for other sizes or from right to left, rapidity of cut off, and the positive feed to the chasers. The Wells Machine Works were formerly the manufacturers of these machines at Fostoria, but their business was recently purchased by the Merrell Mfg. Company.

Millers Falls Company

of Millers Falls, Mass., whose salesroom is at 93 Reade street, New York, have an exceedingly interesting exhibit in Machinery Hall, located in section 13, column I, No. 39. A showcase along the front of the space contains a variety of the small tools made by the company, such as small spirit levels, ratchet drills, Nos. 4 and 5 tool holders, hand vises, machinists' levels, four-faced spoke shaves, family tool chests, automatic drills, screw drivers, small miter boxes, small bit braces, soldering sets, &c. On a table in the rear are shown large miter boxes. Next comes a very large table, which is used for a display of vises, jack screws, drilling machines, &c. Among these vises are samples of the company's new mechanics' vise, with interchangeable jaws, a large steel-faced anvil and a seat which enables the vise to be swung round for the use of filers. Vises are also shown with side sockets to hold drills in place for operating on work held in the vise. The jack screws have ball-bearing heads, which is an excellent feature. In a large upright showcase in the extreme rear are specimens of large tools, such as butchers' saws, hack saws, scroll saws, ratchet drills, bit braces and large spirit levels. Blades for the butchers' saws are furnished so cheap that the user can afford to throw away a dull one instead of wasting time filing it sharp. The Star blade used in the hack saws have very rapidly displaced English blades in recent years, comparatively few being imported now, whereas the entire trade was in foreign hands but a few years since. The bit braces have a number of novel features, such as ball bearings in the head, anti-friction collars on the handle and a steel washer to take up the wear on the ratchet, all of which have been put on the tool without an advance in the old prices. Automatic drills are made with an assortment of drills in the handle, which is a convenience highly appreciated. A ratchet auger handle is shown, which is in high favor among bridge and car builders. It can be used as a ratchet or converted instantly into an ordinary auger handle, according to the character of the work to be done. Along the side of the space stands a row of small machines which are among the company's most popular products. In front is a power saw for sawing cold metal, which will cut a 5-inch angle bar with ease and hardly any waste of material. It can be set to work and needs no further attention, as it stops automatically on finishing the cut. It cuts perfectly square and without the use of oil. This machine is shown in operation on slotted work, cutting rails, sawing bars, &c. On light work it can be operated by a hand crane. Next comes an iron-frame grindstone, operated by a treadle, intended for use in small shops or by families. Then follow a number of specimens of foot-power lathes, each of which has a scroll-saw attachment, which can be quickly added or removed, leaving a lathe capable of quite a range of service. In interesting contrast with fine modern tools, the company exhibit a number of bit braces which were made from 100 to 50 years ago. They are constructed wholly of wood, the bit being held in its place by a wedge.

The Summit Refrigerator Mfg. Co. of Michigan City, Ind., make an exhibit of their Refrigerators in Manufactures Building, section O, block 2. The conspicuous feature of this exhibit is a solid mahogany sideboard Refrigerator which is stated to have cost $1000 It is of large size and most elaborately carved. The central panel in the top, which is usually filled with a mirror, is in this case ornamented with a fine carving which depicts the landing of Columbus. On a bracket to the left stands a carved statuette of George Washington, while on the right is the Goddess of Liberty. This refrigerator is substantially built for regular service, is fitted with the company's patent double system of air circulation, large ice chamber, cold water tank, &c. Other refrigerators shown are regular goods, embracing a number of domestic styles, finished in hard wood, antique finish, with solid bronze trimmings, and built on the double system of air circulation, for which special claims are made.

Mica in Alabama.

The Chattanooga *Tradesman* reports that the representative of a firm of dealers in sheet mica for stoves and furnaces lately arrived in Cleburne County, Alabama, where the mica deposits are situated, and his announcement that he is ready to contract for several hundred tons of first-grade cut mica has given life and impetus to the industry, which for some years past has been abandoned for lack of a ready market for the product. Imported Indian mica, which was put on the market at a low price, had taken the place of the home product to a great extent, and the mining in Alabama, and also to a great degree in North Carolina, ceased. Several miners are now said to be prospecting the mica-bearing veins in Cleburne County, east of the Tallapoosa River, and also in the extreme northern portion of Randolph County, with the double purpose of taking out merchantable mica, and also to develop the ledges, and show by sinking, cross cutting and drifting the extent and value of the different veins. Crystals which when split into sheets cut to size as large as 10 x 12 inches whithout a flaw or stain and of perfect transparency, although of rare occurrence, yet have been found and mined in this district, but as a general rule the sizes to which the first-grade mica can be cut are 2 x 4 inches, 2 x 6 inches, 4 x 6 inches. In the blocks or crystals, the wine-colored mica which, when split, shows perfectly white, quite generally occurs, but it is impossible at present to estimate the percentage of merchantable mica in the district, although it is believed to be large. There is, furthermore, a prospect that a railroad, and perhaps two, will be built before long in this section of Alabama, which will materially aid the economical development of the mica mines.

A pleasant instance of good feeling between employers and employed was shown recently at the works of the Deane Steam Pump Company, Holyoke, Mass. The works of the company have been running for some time but five days a week, and a few days ago the firm decided to further reduce the working days to three, owing to the difficulty of obtaining money to pay their men. The workmen thereupon waited on a member of the firm to signify their willingness to go on working five days at the three days' wages until better times. The firm, while refusing the offer in its entirety, allowed the men to continue the five days' work, saying to them that they would make every effort to pay them weekly for the full time.

STOVE TRADE NOTES.

The Future of the Hot-Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

MISSIONARY WORK.

In all departments of work, secular as well as religious, "missionary work" is regarded as of the utmost importance, and especially is this true of the furnace business. In this country there are hundreds and thousands of buildings erected annually which should be heated by hot-air furnaces and undoubtedly would be heated by this system if the owners were interested in advance of the actual work of construction by the furnace dealer. The advantages of hot-air heat are not brought to the notice of the owner until after other contracts for chimneys, &c., are let and then he does not feel inclined to make the necessary arrangements for the introduction of the heating apparatus. The sale of furnaces in this country would be more than doubled if the dealer would do proper "missionary work," which, briefly, would consist in interviewing intending builders in the interests of furnace heating, and sowing the seed which would bear fruit later. One point in particular should be impressed upon the owner, and that is the importance of putting in the concealed pipes even if no thought is had of putting in the complete apparatus. The cost of the concealed pipe is small and if it is not deemed wise to put in also the registers and boxes the pipes and branches can be run to the proper place and then the location of the registers plainly marked, so that when ready for the furnace the holes can be cut in the floor for the registers and registers and boxes put in and the heater installed. It is not even essential that the boots be attached to the stacks as long as the ceiling of the basement or cellar is not plastered, so that the cost of what work has to be done in order to get in the concealed pipes is a small item, and in cases where an owner cannot be induced to put in the entire plant the dealer can almost always secure the contract for the concealed work. The owner saves the money he would otherwise pay out for extra chimneys and advances the selling price of his building, for it is an undeniable fact that a building into which a furnace can be readily placed without disturbing the walls will command a higher price than one not similarly situated.

THE TIME TO TALK.

While plans are being considered the owner is more receptive to facts and arguments, and then is the time to talk up the heating apparatus and not after the work of construction is under way. Owners have not only more time but are more liberal earlier in the work than later when the inevitable cost of extras stares them in the face. Therefore the furnace dealer should seek out intending builders as early as possible and work up the hot-air heating by every possible means and he will find that his efforts have not been in vain.

In the case of school houses, churches, halls and public buildings, the heating is in the hands of boards or trustees who move slowly, and the dealer first on the ground and who keeps at it early and late is the one who usually gets the plum.

(*To be continued.*)

American Stoves Abroad.

The London correspondent of the *American Exporter* writes to that journal: It has been an open secret for some time past that American manufacturers were going to try to introduce the closed stove—similar to those used in the United States—into Europe. It is said that Berlin and Vienna are the cities where the experiment is going to be tried, because climatic and other conditions are, if anything, rather more favorable than in England. Indeed, closed stoves are already in use in those cities, and there is certainly no reason why American manufacturers should not have a hand in this trade. It is, of course, well understood by American exporters that the stoves supplied to the German and Austrian markets would have to be very cheap, because the great bulk of the people are comparatively poor, and they cannot afford to pay much for their household goods.

I may say that there is no valid reason why the experiment should not be quite successful, assuming that stoves can be placed on the market at a low price. The experience of American manufacturers in introducing this line of goods into France, some 15 years ago, was very encouraging. Several consignments were made to that country, and I believe that similar stoves are now being made in France, from the patterns of those previously sent from the United States. It is estimated that about 30,000 of these stoves, made on the American pattern, have been sold in France, but of course considerably more than this number could be disposed of if the business was taken up in an energetic manner by exporters in the States.

Even Switzerland, which is one of the quietest and most conservative little countries on the face of the earth, is taking kindly to the closed stove, and a shipment of them has recently been made from an American house to a Swiss firm.

It is exceedingly difficult to say whether the experiment will succeed in England. The English people are wedded to their open fire places, and it will take a good deal of arguing to displace the prejudice against the closed stove. But this remark only applies to the better class of private houses, where the owners keep servants, and can afford to buy all sorts of appliances to minimize the inconvenience of smoky chimneys. In small houses, however, where the occupants are comparatively poor, the closed stove may be preferred on account of its economy. For heating small public buildings—such as school rooms, lecture rooms, &c.,—I think the American stove is just what is wanted. Of course they can be supplied in all sizes, to suit the purpose for which they are required. Although the open fire place may have a more cheerful appearance than the closed stove, such an advantage is more fanciful than real. Every resident in England knows that, on a cold day, a person can sit in front of a big fire in an open grate, and almost scorch his face while his back will be icy cold. Where a closed stove is used the heat is diffused all over the room, and there are no cold corners and drafts to avoid.

I may be permitted to state briefly a few of the advantages possessed by the American closed stove over the ordinary English open fire place.

ECONOMY OF COAL CONSUMPTION.

Speaking from considerable experience, I think it will be found that the closed stove consumes much less fuel to produce a given temperature. It requires very little reflection to show that this must be so. In the open grate fully 40 per cent., and in many cases 50 and 60 per cent., of the heat goes up the chimney, and is totally lost for the purpose of heating the room, and only serves to warm the streets. The draft can also be so nicely regulated in the closed stove that absolutely no coal need be wasted. When a room gets warm enough the regulator can be adjusted accordingly; whereas in the open fire place there is no alternative but to open the door or windows and let in a gust of cold, damp air. With a closed stove people can keep up just what size fire they require; whereas it is very difficult to do this with the English stoves, because a small fire is always liable to die out suddenly. There is really no proper method of regulating the draft of the open stove, and this necessarily entails a larger consumption of coal than would otherwise be requisite. The American stove is therefore cheaper on this account alone.

LESS TROUBLE.

Every English housekeeper knows the immense amount of trouble caused by the open stoves. They always want "brushing up;" and unless the cinders which fall through the bottom bars are constantly being taken up, the hearth place looks dirty and untidy. They also require a good deal of attention in the way of being supplied with fuel; nor can a fire be left in an open stove for many hours unattended without "going out." Then, again, where the American stove is used there is practically no trouble with chimneys, which do not require sweeping except on rare occasions. This, again, is a saving both of time and money.

NO SMOKY ROOMS.

It only requires residence in an English house to appreciate any system which promises to do away with a smoky room. The closed stove, however, will do this, the smoke being carried away up the chimney by a properly regulated draft. Of course, anthracite

coal is the proper fuel to use in these stoves, and is superior to other kinds of coal for this purpose. It burns much slower and gives greater warmth than any other variety. Considerable quantities of this coal are being shipped to Europe for consumption in the closed stoves, and can be purchased at just the same price as the inferior coal obtained from European mines.

Matchless Stove Works.

We are indebted to Graff & Co. of 632 and 634 Liberty street, Pittsburgh, Pa., for a copy of their annual catalogue and price-list of cook, gas, parlor and heating stoves, brick-set and portable ranges and furnaces and iron and steel ranges, grate fronts, fenders, &c. The leading place in the catalogue is given to the Grand Denver, a six-hole range with tasteful ornamentation and made with a fire box on the right or left hand side, according to requirements. It has the late improvements, including heavy castings and extra large ovens. Some of the other goods which may be noted are the Columbus, a neat durable range with sectional fire back and cut centers; the Columbia, made in three sizes, one of which has five holes and the other two six holes in the top surface; the Ellwood, a low-priced four-hole range, and the Denver, a substantial construction made in a variety of styles and sizes. The cook stoves are represented by the Western, Matchless, Iowa and Ashford, the latter being intended for burning wood only. Among the heaters we find the Matchless Oak, mounted with heavy cold-rolled sheet iron, extra deep ash pit and nickel trimmings; the Shenango, a hard coal base burner of attractive appearance; the Grafton, a neat open Franklin parlor stove having improved dumping and shaking basket grate; the Matchless, a soft coal furface burner, together with a long list of globe, cannon and laundry stoves. The closing pages of the catalogue are given up to price-lists of stove hollow ware, grates, flue rings, water shoes, &c., mantels and grate fronts, and an illustrated description of the Monarch warm-air furnace and the Matchless heater intended for soft coal, hard coal, coke or gas. A corrected list of stoves manufactured in Pittsburgh, together with directions for using the Matchless furnace, are features of the catalogue.

Safety of Oil Stoves.

We take the following from a recent issue of the *Times*, published at Portsmouth, N. H.:

"Cleanliness is next to godliness," the divine book informs us; so, too, it is an assurance of a perfectly safe oil stove. Interviews with dealers in these commodities, and especially with reference to their safety, are to this effect: As regularly as the summer season comes round, fires are reported in the newspapers as having been caused by the explosion of oil stoves. In such cases what really happens is this: A person rushes into a kitchen where there is an oil stove, notices the said stove enveloped in flames, and, catching it up, throws it bodily out of the nearest window. The stove is broken to pieces by that proceeding, but there has been no explosion; in fact, dealers say that oil stoves never explode. The trouble, they say, is that people do not take proper care of the stoves. Instead of cleaning them from time to time, as in the case of lamps, they neglect them and allow them to become clogged up with a coating of dust and oil. That mixture is very inflammable, and if it remains about the wicks it will evidently take fire.

Trade Poetry.

The fact is becoming more and more apparent as the years go by that there are among the members of the stove trade those who can write poetry with the same success that they can sell goods. An effusion appeared not long since in an issue of the Everett *Herald*, published at Everett, Mass., which we make bold to present to our readers, with title and introduction as follows:

"YOU SOUGHT THE MOUNTAIN RANGE."

One of the young men at the office of the Magee Furnace Company being away on a vacation, their poet laureate sends with a copy of Baxter's "Saint's Rest" the following plaint:

DEAR JOHN:
You sought the mountain *range*
With *rest* and *change* in view,
Now friends at home invest *their change*
And send the "*Rest*" to you.
The *latter may not* be the sort
Your *tired fancy* paints.
It ought to please, the author thought
Its good enough for *Saints*.
We know *you* for a *sinful chap*
Not one we would select
As fitted to enjoy the "snap
Cut out for *the elect*.
But funny metamorphoses
Are brought about by Fate,
As nice in operation as
Our famous "*Dock Ash Grate!*"
So you on the cool brooklet's brink
Or *Alpine* heights recline,
While *torrid d.ys* here make *us* think
"*Hot air*" our proper line—
For really quite *stove up* are we
And longing for *some ch inge;*
Till Congress aids the currency
'Tis way beyond *our range*—
A little nonsense now and then
Gives life an added zest.
But *'tis too hot*—we drop our pen—
We too must take a "*Rest.*"

BOSTON, August 10, 1893.

Covering Hot-Air Pipes.

A correspondent who has had a highly satisfactory experience in the use of asbestos as a non-conducting covering for hot-air pipes sends us the following article in praise of insulation:

Householders frequently complain through the winter of the large quantity of coal consumed in heating their dwelling, also of the overwarm condition of the cellar, which cause apples, potatoes or other supplies stored there to decay, and renders it necessary in many cases to use ice the entire year to properly keep butter, milk and other perishable food. Even with this large expenditure for fuel it is often impossible to comfortably warm the house, and occasionally the wood work ignites from the hot pipe running from the furnace to the register, and a serious conflagration results, which might have been avoided by the use of a proper non-conducting covering on the pipes. Of course the colder the weather the more forcibly these defects assert themselves, and when the wind is high and the thermometer low, many perceive to their great discomfort that their furnace or steam heater, which has been efficient in ordinary weather, does not heat the house. An examination at the heater will show a good draft, a bright, clear fire, a free consumption of coal—in short, everything in good order—and the heater, as promised by the maker, generating a large body of heat.

Where, then, is the trouble? What is the defect? Why with so much heat on hand below stairs is so little obtained upstairs? are the questions you will ask yourself. Manifestly there must be a radical defect in an apparatus that pours a large volume of heat into the cellar, where it is not wanted, and sends but a small volume of heat to the rooms above, where a large amount is wanted. To answer these questions in advance is the purpose of this article. A serious defect exists in the equipment of most heating apparatus, and very likely in yours, which can and ought to be remedied. If we told you of a leak in your roof you would repair it before the next rain. If a window pane was out you would replace it at once. We now tell you of a leak in your heating arrangements, and the prudent householder will attend to it without delay.

This leakage or waste is due to the radiation of heat from the iron or tin piping, somewhere between the furnace or heater and the register or radiator. In effect, the loss is just as serious as though holes had been drilled in the iron, and the steam or hot air was pouring through them into the cellar, and the result is a failure to deliver the heat in the rooms above at the same initial temperature as it left the heater below. This is the working of a well-known law, that metallic bodies, like tin or iron, transmit and radiate heat rapidly. The heat on the interior of the pipe is quickly conducted through the iron, and then as rapidly radiated into the air of the cellar. This is a loss to you—a loss that is going on every day the heater runs. Every heat unit that is wasted downstairs will help, if saved, to raise the temperature upstairs. Do not flatter yourself that it occurs in cold weather only. It is worse then, and more noticeable, but it is going on constantly. Every day you are burning coal that goes to heat your cellar and paying your coal dealer for goods you do not need. This loss of heat, and consequently waste of fuel, can be stopped. Heating plants that do not give proper service can be made efficient by the use of the mineral asbestos, if applied in proper form. It is clean and handy, fire proof and safe; it stops radiation, prevents loss and saves money.

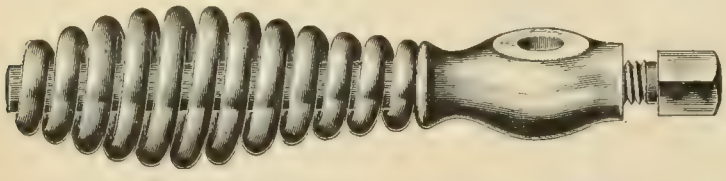
The Union Stove Works

of 70 Beekman street and 66 and 68 Gold street, New York City, are sending out a well-arranged catalogue, consisting for the most part of illustrations and descriptive text relating to patterns of stoves, ranges and heaters with which the trade are already more or less familiar. The special feature of the volume is found in an appendix in which attention is invited to the new goods for this season and to the stoves which have been improved for 1893. Among these may be mentioned the Dover B, a very attractive five hole range with swell doors, nickel name plate, patent oven-door opener and oscillating oven shelf. The makers state that this stove is not only popular in the United States but commands large sales in all foreign countries where American ranges are sold. The Glen B is another five-hole range of attractive ornamentation which has swelled doors, patent oven-door opener, oscillating oven shelf and other features which are likely to render it popular with the trade. The Bon Bon B is in all respects similar to the company's regular range made under this name, except its fancy base and legs, which add to its general appearance. Another new stove embodying the modern improvements is the Colon, made in one size for burning either coal

or wood. The design of the ornamentation on the panels and oven door is in imitation of the sun-burst, producing neat effects. Another new stove is the Palos, also made in one size and embodying the modern features. The Astor No. 70 is a six-hole range intended for flats or apartment houses, while the Astor No. 25 is a double-oven range with a duplex grate. Flirt B, Belmar, Invader, Rush and Rover are some of the heaters which are presented. The catalogue closes with a number of blank pages intended for the purpose of memoranda. The price-list for the company's goods is embodied in a 24-page pamphlet bearing date of August, 1893.

Some New Alaska Handles.

The Troy Nickel Works of Troy, N. Y., have just brought out some new patterns in the way of stove handles, general views of which are presented in the accompanying illustrations. These handles are made on the same general principles which have given to the productions of the concern a wide reputation, the coiled wire keeping the handles always cool to the touch. The general arrangement of the several parts of which the handles are composed is so clearly indicated in the engravings that extended reference to this feature is unnecessary. The handle shown in Fig. 1 may be used for a variety of purposes, but more especially in connection with gasoline stoves, while the one illustrated in Fig. 2 is intended for use on furnace doors.



Some New Alaska Handles.—Fig. 1.—Handle for Gasoline Stoves.

Fig. 2.—Handle for Furnace Doors.

The Glazier Stove Company

of Chelsea, Mich., have just issued from the press an exceedingly neat and attractive catalogue, showing their leading specialties in the way of oil and gas stoves. The little volume is printed in good style, and is bound in colored paper covers, with side title in bronze letters upon a ground work of a delicate shade of pink. The goods illustrated are made for the most part under the designation B & B, the oil heaters being provided with spun brass oil tanks, with patent automatic indicators. This device is something new, and is attracting no little attention on the part of the trade. All parts of the tank are made of brass, being drawn or spun from solid sheets after the same style as the Rochester, Pittsburgh and other large lamps. By this means the company are able to do away with nearly all soldered seams below the oil line. The patent automatic indicator shows at a glance the hight of the oil in the tank. A double-thick 15 inch circular wick is employed in connection with the B & B heater, and the makers state that it does not have to be replaced with a new one when burned off, but can be raised and gripped again, making it as good as a new wick. The wick raiser grips the wick on six sides and raises it with perfect uniformity. The No. 20 oil heater which the company are offering to the trade stands 50 inches in hight and has a base 20 inches square. It is mounted on rollers and is finished in nickel in a way to produce a very brilliant effect. The letters B & B used in connection with these goods stand for Brightest and Best. The catalogue shows also an interesting assortment of combination cook stoves and heaters, as well as constructions intended for cooking purposes only. A variety of lamp stoves, extension tops, ovens, gas stoves for heating and cooking purposes, together with miscellaneous goods, are features of the volume.

ODD PLATES.

On the cover of a red and white striped pasteboard box that came in the mail is a red label on which is a handsome young man with a similar box in his hand and the words "Roly Boly," with the following directions: "Times being such as to allow you some leisure, place the balls in their respective positions as to color, and then remember that the Alaska Trimmings are Always Cold." On raising the lid, "Compliments of Troy Nickel Works, manufacturers of Always Cold Alaska Stove Trimmings, established 1880, Troy, N. Y.," greets the eye, after noting three different colored balls with little inclosures in which they are to be corralled, providing you have the skill. This seemingly easy job is, however, a contract of immense proportions, and any ordinary enthusiasm will grow as cold as an Alaska handle before it is accomplished.

W. P. Abendroth of Abendroth Bros., New York, finds the atmosphere of Saratoga agreeable and entirely free from anything suggesting stoves, even though it has been the scene of national conventions.

The Gem City Stove Company of Dayton, Ohio, resumed operations in their works the early part of the week after a brief shut down. During the time that operations were suspended the company made some changes, among them being the addition of a new 20-ton cupola. Their goods are meeting with a gratifying demand and a large fall trade is expected.

The Electric Oil Stove Company of Homer, Mich., favor us with circulars of the Electric oil heater and the Electric oil range, the latter having been improved for 1893. The heater has oil tank, water reservoir, burner, wick tube, &c., made of rolled sheet brass, while the flame deflector is cast iron and will not, it is claimed, burn out. The wick raiser in combination with the rewicking attachment is referred to by the company as simplicity itself, while being strong and positive in its action. An ornamental drop mica door gives access to the burner for lighting without tipping back the upper part of the stove. The capacity of the oil tank is 1 gallon, its location being such that the cold air passes entirely around it, thus keeping the oil cool. The castings are highly polished and nickeled, producing a brilliant effect.

The Security Gas & Vapor Stove Company, St. Louis, Mo., made an assignment recently for the benefit of their creditors. The assets of this concern are more than sufficient to cover their liabilities, but inability to raise money on what they considered good securities forced them to make an assignment. They expect to make arrangements with their creditors in the course of a few days, and it is expected that the business will be continued as heretofore.

The work of fitting up the machinery and other appliances at the plant of Foster Brothers, proprietors of the Central Stove Works, Lebanon, Pa., is being pushed forward with great rapidity, and it is expected that the production of stoves will soon commence.

The Tuttle & Bailey Mfg. Company, 83 Beekman street, New York, issue a circular letter to their Western customers and friends, announcing the opening of a branch store at 136 Lake street, Chicago, where they keep a large stock of registers, ventilators, &c., of all sorts and finishes. They also refer to their sample goods on exhibition at the World's Fair, located in the Manufactures Building, Section O, Block 3, Post 69, where they have many new designs and finishes in bronze, nickel, silver and gold plated and other styles.

One of the latest blanks issued by the Excelsior Steel Furnace Company, Chicago, Ill., is for the use of customers in taking measurements on jobs of hot-air pipes, dampers, elbows and casing collars. It is pointed out that usually these measurements are taken by the workman on scraps of paper and leaves torn from memorandum books, and, on account of this utter lack of system, there is constant liability to error. With the blanks, however, issued by the Excelsior Steel Furnace Company the information is furnished in an orderly way and affords a permanent record of the fittings needed, that can easily be transmitted to

an order blank when the job is ready for piping. The blank is a sheet 11¼ x 9 inches in size, each side being divided into three spaces, reading as follows: "22½-degree angles IC, IX; Dampers, hot air; Casing collars, top straight side. Pitch 75 degrees to 60 degrees." On the other side of the sheet the divisions are headed: "Hot-air pipe IC, IX; Elbows 3 pc., 4 pc. IC, IX; 45-degree angles IC, IX." Each of these main divisions is divided into 12 columns, headed with inches from 7 to 30, so that the proper number of elbows, pipe, &c., of the different diameters can be inserted. The company have sent these blanks to a number of dealers, and they learn that they have been of great assistance in avoiding errors.

ADVICES from Detroit are to the effect that on the morning of Monday, August 21, operations were resumed at the works of the Michigan Stove Company, a full force being employed.

A. R. SALLE, until recently general agent of the Milwaukee Gas Stove Company, in charge of the Chicago store at 128 Michigan avenue, has succeeded Mr. Detwiler as general manager at Milwaukee. Mr. Salle leaves the management of the Chicago office in the hands of H. J. Forsyth, who needs no introduction to the stove trade. One of the new things the company are placing upon the market this season is the Perfection fire place, which has to be seen to be fully appreciated. It has many merits, one being that it throws all the heat out into the room instead of allowing part of it to pass up the chimney. It cannot blister the mantel, and owing to its construction is absolutely odorless.

THE STOVE TRADE, plumbing trade, tinners' trade and all of the kindred trades on Beekman street are positively suffering from an inability to fill orders. In the present condition of affairs generally this street seems to be a notable exception and would be open to congratulation if it were not for the cause. For some weeks the street has been turned over by the city to a band of noble American workingmen who speak all of the known tongues except Americanized English. The sidewalks are covered with granite blocks, so that the merchants can only with difficulty get to their stores and only such goods as can be carried to a cross street, to be loaded on trucks, can be shipped. The middle of the street is truly a desert, as sand predominates, though street cars run down the center—when they do not run off the track, or are permitted to by the present rulers. These merchants are entitled to better treatment by the city officials, who should complete the paving work with reasonable dispatch.

THE MICHIGAN STOVE COMPANY favor us with a sample of the paper glass sign which they are now distributing. It consists of the Garland trade-mark printed in colors on a transparent paper which will adhere to a window pane, its transparency causing it to present a brilliant appearance when viewed from either side.

THE CHICAGO daily papers are justly sounding the praises of Miss Florence Hawkins, daughter of Frederick Hawkins, the manager of the Fuller Warren Company's Chicago branch. Miss Hawkins risked her life on the 24th ult., at Lake Geneva, Wis., endeavoring to save a lady companion who was beyond her depth and could not swim. They were bathing at the time. The sinking lady, however, clutched Miss Hawkins with such a grip that both would have been drowned but for the timely assistance of two gentlemen, Stanley and Arthur Midgley, who saw them struggling, jumped in to their relief and rescued both of them.

E. BEMENT & SONS of Lansing, Mich., talk in a different strain from stove manufacturers generally. They announce publicly that they are running full force in every department of their enlarged and improved plant. They have not shut down a single day and are in a better position than ever to give their customers good service and first-class goods. This is one of the most cheerful statements concerning the condition of the stove trade that we have recently heard, and we hope that they may have no reason to modify it as the season advances. The situation generally seems to be really brighter, however, and we shall be greatly disappointed if the stove trade does not improve very considerably before the advent of cold weather.

THE NORTH DIGHTON CO-OPERATIVE STOVE COMPANY, North Dighton, Mass., have issued another attractive poster, lithographed in colors, advertising their Oak Grand, Live Oak and Prize Oak ranges. The design of this poster consists of a striking illustration of the "Summer Girl" in the mountains. The colors of the design are harmoniously blended, and the effect is pleasing.

THOMAS MORAN has recently established himself in the business of manufacturing stove castings at Bradford, Pa. We understand that he has the patterns from which to make all sorts of repairs for 60 different kinds of stoves. Mr. Moran was for many years connected with the Co-operative Foundry Company of Rochester, N. Y.

THE ART STOVE COMPANY, Detroit, Mich., have just completed the last size of their new base parlor heating stove known as the Laurel. It is made direct draft and full revertible flue, the latter being so constructed that the entire products of combustion are carried to the outer edges of the base of the stove, resulting in a great economy of fuel. This line has met a very gratifying reception at the hands of the trade, and the manufacturers are distributing a neat circular illustrating and describing the two forms in which it is made. The company state that they are running their works all summer and that their cancellations are not above those of last year.

THE FAVORITE STOVE & RANGE COMPANY of Piqua, Ohio, mailed to their customers under date of August 28 a circular letter stating that the company have been running their extensive works full capacity thus far the present year and expect to continue doing so in the future. They state that shipments up to the present time are largely in excess of those for the corresponding period of last year. During the past summer the company have added to their extensive plant several new buildings, two large boilers, a 200 horse-power Hamilton Corliss engine and considerable new machinery, largely increasing their capacity and enabling them to handle their orders with greater dispatch than ever before. The circular letter also states that the company are constantly adding new patterns and expect to bring out new goods according to the requirements of the trade. The company expect a scarcity of stoves this fall, for the reason that the production per week is estimated at over 50,000 stoves less than a year ago at this time.

Sealed proposals will be received at the office of the Supervising Architect, Washington, until September 19 for the stone and wood work, iron and wood floor, ceiling, roof construction and roof covering for the United States Building at Aurora, Ill. Drawings and specifications can be obtained from the Supervising Architect at Washington or from the superintendent at Aurora.

TRADE REPORT.

The Iron Market.

There seems to be quite a general determination to take a brighter view of the situation. That in itself is a very good beginning, but it is likely to cause a reaction, unless there is an early appearance of convincing evidence in its support. Such evidence is not wanting, but it must be frankly confessed that it is not as yet very impressive. It is not fair to expect it. Recovery is bound to be disappointingly slow to the sanguine, while entirely satisfactory to those who look forward to an expansion of consumption by small increments rather than by sudden calls for large quantities.

The fact that quite a number of mills are starting up is in itself evidence that there has been some accumulation of orders and considerable clearing up of stocks. The fact is noted, too, that inquiries are beginning to come in and that there are occasional indications of a speculative interest, though it is still very timid.

The most encouraging news thus far comes from those departments of the trade in which the bulk of the product reaches consumers in relatively small quantities, and where, therefore, jobbers and merchants are a more important factor.

That part of our industries which relies upon the railroads as purchasers is still suffering from an unprecedented lack of orders. In engineering work and in the architectural branches there is a somewhat better demand, but as yet it has not reached even a modest volume, while the future is clouded by the fact that the building season has only a few more active months.

Pig Iron.—The New York market is still exceedingly dull. Locally some of the largest consumers still decline to take shipments and are melting very little Iron. Tempting offers are still being made for cash. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $13 for No. 1 Soft.

In the Philadelphia market the demand is chiefly for small lots, which, as a rule, are taken at quoted rates. Large lots are not inquired for to any extent, so that the only way of realizing on such is to make an extremely low quotation, so low, in fact, that no holder would make it unless under great financial stress. The expectation is, however, that the demand will soon begin to show improvement, but in any event prices are not likely to go lower. General quotations are about the same as last week. Small lots command pretty close to asking prices, but for spot cash, or under conditions specially favorable to the seller, 25¢ to 50¢ less would not be considered extreme concessions. Ordinary time sales are usually at about $12.50 @ $13, delivered, for Plain No. 2, $13.75 @ $14.25 for No. 2x and $14.50 @ $15 for No. 1x.

Outside of an occasional sale, involving 100 or perhaps 200 tons, there is nothing doing in Pig Iron in the Pittsburgh district. There is still considerably more being made than is being consumed. The demand for Foundry and Mill Irons is very light, the movement being but nominal. Prices show no decided change, quotations being as follows :

No. 1 Foundry	13.00 @	$13.25	cash
No. 2 Foundry	12.00 @	12.25	"
Charcoal Foundry No. 1	15.00 @	16 00	"
Charcoal Foundry No. 2	14.00 @	15.00	"

Reports from Chicago show that there is very little doing in Southern Coke. Large companies, however, are standing firmly on the prices given their agents here and are turning orders down rather than make a further cut. Local Coke is in no better demand, but collections are remarkably good considering financial conditions. Inquiries noted for the past two or three weeks are not developing much business, as the people making them are either looking for bargains or else simply inquiring to keep posted on the course of prices. The Malleable Casting syndicate appear to have picked up enough odd lots to satisfy immediate requirements and are not negotiating for anything further in Lake Superior Charcoal, and the expected heavy purchases have faded from the vision of sellers. Quotations are as follows, subject to concessions for prompt cash and immediate shipments:

Lake Superior Charcoal	$16.00 @	$16.25
Local Coke Foundry, No. 1	13.50 @	14.00
Local Coke Foundry, No. 2	12.75 @	13.00
Local Coke Foundry, No. 3	12.50 @	12.75
Local Scotch	14.00 @	15.00
Ohio Strong Softeners	15.75 @	16.25
Southern Silvery, No. 1	@	14.50
Southern Silvery, No. 2	@	14.00
Southern Coke, No. 2	12.60 @	12.85
Southern Coke, No. 3	12 10 @	12.25
Southern, No. 1, Soft	12.60 @	12.85
Southern, No. 2, Soft	12.00 @	12.25
Tennessee Charcoal, No. 1	16.00 @	16.50
Alabama Car Wheel	@	18.85
Hocking Valley, No. 1	15 25 @	15.50
Jackson County Silvery	16.50 @	17.00

In local Southern markets there is little more than a carload demand for Pig Iron, which is freely supplied at previous quotations, but there have been large orders from the East which have kept the market from stagnation. An inquiry for a considerable quantity of No. 2 and No. 3 Foundry, while it did not lead to any business, developed the fact that these Irons could be bought for spot cash much under the quotations, showing that there are some needy furnaces that would sell Pig Iron for less than the cost to manufacturers. While quotations cover most of the business done, they do not represent the lowest prices for which Pig Iron might be bought for prompt delivery and spot cash, when the price would depend upon the urgent necessity of the sellers and might not be repeated. It is believed that the market is rapidly working into a condition that will bring around a more satisfactory state of trade. Quotations are given as follows :

Foundry.

Southern Coke, No. 1	$12.75 @	$13.00
Southern Coke, No. 2	10.75 @	11.00
Southern Coke No. 3	10.25 @	10.50
Ohio Soft Stone Coal, No. 1	15.50 @	16.00
Ohio Soft Stone Coal, No. 2	14.50 @	14.75
Lake Superior Coke No. 1	15.00 @	15.25
Lake Superior Coke No. 2	14.00 @	14.25
Hanging Rock Charcoal, No. 1	18.50 @	19.00
Hanging Rock Charcoal, No. 2	17.50 @	18.00
Tennessee Charcoal, No. 1	14.00 @	14.25
Tennessee Charcoal, No. 2	13.00 @	13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @	18.00
Lake Superior Car Wheel and Malleable	17.00 @	17.25

Metal Market.

Pig Tin.—There has been an advance of about ¼¢ ℔ lb in Straits Tin for prompt delivery. A week ago there were sales at 18.75¢, while business was effected this week at 19.25¢. Sales and resales of contracts during the interval involve about 650 tons, and it was intimated in some quarters that half as much more stock was turned privately, chiefly for September delivery. Operations in the later deliveries have been very moderate, but prices for these as well as for early deliveries have improved decidedly. Closing of old contracts has figured with some prominence and nicely timed manipulation has been effective in helping prices upward, but gradual reduction of surplus supplies is beginning to count as a factor, and some turn of sentiment has been brought about by strong circumstantial evidence that the greater portion of available supply is in the hands of dealers who have financial matters so adjusted that carrying Tin at present is a pleasure rather than a burden, since spot supplies are being reduced in no uncertain way, or, say, at the rate of close on to 1500 tons a month. The market closed firm on Thursday at 19.40¢ for September, 19.70¢ for October, and 19 80¢

November. The consumptive demand meanwhile continues comparatively light, at unchanged prices for small lots, namely 21½¢ ℔ lb for Banca Pigs and 21¢ for Straits.

Copper.—It is estimated that exporters have purchased upward of 5,000,000 lb of Ingot during the past fortnight, and facts are brought out that would warrant the statement that the estimate is a modest one. The movement included Lake Superior Ingot, Electrolytic and even casting stock. No particulars as to the proportion of the respective varieties taken by shippers were divulged, but the movement seems to have been sufficient to arrest the previous downward tendency of prices. The buying for home account has not improved to any great extent, nor does the demand show much spirit. Still, some offers were made indicating that none but small lots of Lake Superior Ingot, if, indeed, any, can now be secured at 9½¢ for prompt or near future delivery. In this connection it may be noted that 9⅝¢, regular terms, was bid for over 250,000 lb in the face of offers of contracts on the Metal Exchange at 9.50¢ @ 9.60¢. Prices for small lots of Ingot Copper are unchanged. The retail demand is reported by jobbers as showing more encouraging features. Orders and inquiries are both better than last week, both in number and size, and the outlook is regarded as more encouraging.

Sheet Copper.—A fair demand exists for this material as compared with that which has prevailed for many weeks. Prices are inclined to stiffen at the bottom figures quoted last week, attributable possibly to the removal, by failure, of one of the largest manufacturing firms in the trade, who were said to have been making large concessions to get business.

Pig Lead.—Two weeks ago the price of common domestic Pig Lead was down to 3.30¢. A week later the price was up to 3.45¢. Since then there has been an advance to 3.70¢ @ 3.75¢, and there appears to be less Lead on sale at 3.75¢ at the present time than there was at 3.30¢ a fortnight ago. To all accounts not over 500 tons have been sold in this market during the past week, and the appearances are that the effect of the diversion of Mexican Silver Lead Ores to Europe and liberal shipments thence of Pig Lead smelted from Mexican Ores, along with light American production, leave home consumers at some disadvantage, for the time being at least. Certain it is that the stock on the spot is unusually light, and that Western smelters still hesitate about selling lots of over 50 tons at present prices. The retail demand is dull, at unchanged prices—namely, 4¢ ℔ lb for American Pig and 4½¢ for Bar Lead.

Lead Pipe and Sheets.—Since the middle of the month a decided falling off has taken place in the demand for Sheet Lead and plumbers' supplies, owing to the check in many building operations. Contractors for such buildings as are now well advanced or completing have already purchased the materials required, and few new undertakings have been begun. The outlook is not regarded as promising by dealers, in view of the rapid advance in price of Pig Lead.

Spelter.—This is the weakest spot in the Metal market. Ordinary brands of Western Spelter have been sold at 3.55¢ @ 3.60¢ for prompt and near future shipments. Choice brands brought 3.95¢ @ 4¢, delivered to New England points. Dealings in the several grades have been on a very moderate scale, and the demand at present is slow owing to the stagnant condition of Galvanizing and Brass manufacturing industries.

Tin Plates.—The market shows signs of betterment in one or two directions, although little or nothing has been noted in the way of inquiries for round lots or future deliveries. A fair spot demand is, however, observable for Cokes for canners' use in the Western, Middle and Southern States, where the corn, tomato and fruit crops are now ready for packing; the purchase of material having evidently been postponed to the last moment. The truth of the adage about being an ill wind which blows nobody any good has been experienced by dealers in Roofing Plates, who have for the past day or two been benefited by the results of the great storms which have worked such havoc in the South. Telegraphic orders have been received in New York by several houses for immediate shipments of Ternes to Charleston, Savannah, and other Southern points, where the damage to roofing has been extremely severe. The demand for Terne Plates from the stricken districts is expected to be a heavy one for some time to come. A fair retail consumptive demand for domestic Roofing Plates, showing marked improvement over the past few weeks, is reported by jobbers. The public satisfaction at the action of Congress in regard to silver legislation is thought to be reflected in a better feeling among consumers, who, however, do not yet show much tendency to purchase more stock than they need for immediate use. Prices are fairly steady at the former rates, although concessions on good-sized orders are not hard to get.

A London cable despatch of August 30, to *The Iron Age* reports:

Tin Plate market is still somewhat irregular, but anticipated early termination of the coal strike in Wales is bringing more inquiry. With holders willing to unload, a very good business has been done. Several lots of full weight high grade Cokes were sold at 11/6, f.o.b. Liverpool. Buyers have, however, since reduced their limits. American business generally is limited. For Russian account scarcely anything is moving. Over 20 works are now idle, owing to scarcity of Bars and lack of fuel. Stocks at shipping ports, 241,000 boxes, against 236,000 boxes a week ago. Liverpool prices are as follows:

IC Charcoal, Alloway grade	12/9 @ 13/3
IC Bessemer Steel, Coke finish	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12/
IC Coke, B V. grade, 14 x 20	@ 11/6
Charcoal Terne, Dean grade	@ 11/6

The *Iron and Steel Trades Journal* of London stated recently that, owing to the stoppage of many Welsh Tin-Plate works for want of coal, those manufacturers who are able to continue operations have taken advantage of this circumstance to ask for higher prices. In the present demoralized state of trade, however, it has been found impossible to get better prices just now. Quotations are nominal, and any business concluded is based upon the best arrangement that can be made.

Sheet Iron.—The market for Black Sheets is unchanged in its dullness. Prices are weak, and inquiries and orders few and far between. Galvanized Iron, on the other hand, is strong and is said to be becoming scarce, consequently prices have stiffened and talk is still had of an advance, but some of the idle mills are reported to be getting ready for starting up again, and this circumstance, combined with the low price of Spelter, which enables the galvanizing to be done at a less cost than ever before, would probably prevent any permanent rise in prices for Galvanized Sheets.

Chicago Report.

Scrap.—The slack demand has caused dealers to lower their buying prices again, and they now make the following list:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....

CONDITION OF THE

Hardware Trade.

IT IS PLEASANT to note indications of improvement in business which, although slight, are encouraging as to the future course of trade. Some increase in the demand from retailers and jobbers is reported, and travelers are sending in more frequent orders and for somewhat larger quantities. These orders are, however, for the most part small and for the most part cover only the immediate requirements of the purchasers. Reports from some Western points are also gratifying, as indicating a perceptible improvement. The assurance of the early repeal of the Sherman bill, and the accompanying improvement in the financial situation are noted with especial satisfaction, and it is hoped that there will be a gradual if not a prompt return of confidence and prosperity. The manufacturers of Hardware are for the most part in operation, but are running their works on short time. The conservative policy pursued has prevented the accumulation of the usual stocks of goods, and in many lines if an animated demand should set in there would soon be difficulty in executing orders. In other lines, however, stocks are ample. Collections are referred to as fair in view of existing conditions, and there is less complaint on this score than for some time past. The financial strength shown by the Hardware trade throughthe country is a matter of congratulation.

Advices from Chicago.—The Shelf Hardware trade in this city has improved considerably. Orders are now coming in for Sheet Iron, Stove Boards, Stove Pipe, Elbows and other cold-weather goods which must soon be supplied to the consumers in the Northwest. A considerable trade in corn crop specialties is also doing, such as Corn Knives, Baskets, Scoop Shovels, &c. The buying is not in large quantities, but the movement is, nevertheless, encouraging, as orders are getting more numerous. The demand for Builders' Hardware is only moderate and not to be compared with what it would have been under ordinary conditions. Reports from Milwaukee are even more encouraging than from the Hardware trade in this city. The Milwaukee jobbers say that their collections are greatly improved of late and their orders are very much better, so that they are not inclined to complain of the business they are now doing. It is hoped that the failure of George C. Cribb, which occurred there on Monday, will not seriously interfere with the better feeling which has developed so rapidly of late. Mr. Cribb's failure is an important one, as his assets are placed at $800,000 and his liabilities between $600,000 and $700,000. He was an extensive dealer in Agricultural Implements, wagons and carriages. Manufacturers of Hardware specialties have not yet begun to feel much benefit from the encouraging outlook in the trade. It is too early for this to occur. It is something new to be told by jobbers that they can ship goods on consignment, and that they will be sold if possible, but this has been the experience of more than one manufacturer of late when soliciting orders. Brass and Copper goods are moving very slowly, and there is not much doing in Tin Plate. Orders in these lines are confined closely to the pressing wants of consumers. A notable feature of the trade is the very heavy demand for Bale Ties for baling hay, evidently caused by the large exports. The trade in Heavy Hardware is not in quite as good condition as Shelf Hardware. This is owing to small demand from manufacturing consumers, whose factories have been quite generally shut down to await an improvement in the financial situation.

Notes on Prices.

Wire Nails.—The slight improvement which has characterized the market for the past week or two still continues, with some increase in the demand. The mills which have been closed so generally during July and August are beginning to resume operations. The shut down has prevented any accumulation of goods in their hands, and stocks are broken, the trade finding difficulty in obtaining complete assortments. The negotiations with reference to an agreement for the control of production and prices have not yet been consummated, but it is understood that they are progressing favorably. The manufacturers in the meantime are holding quite strictly to $1.50 for carload lots, f.o.b. mill, and are not making special efforts to secure business. If they succeed in completing the proposed agreement among themselves it is probable that there will be a slight advance in prices, and this fact is probably having some influence with the trade in stimulating business. Small lots from store in New York are held at $1.65.

Advices from Chicago.—The inquiry for Wire Nails is considerably better, but the situation with regard to prices is not entirely satisfactory. Some mills report that jobbers are placing orders for early delivery, while others complain that they are finding interference with their natural trade from a heavy buyer who evidently stocked up at the late low prices. Quotations on factory lots range from $1.53 to $1.60, Chicago, according to the condition of the manufacturing company. Those who are starting up their factories are experiencing trouble in getting Rods, as so many Rod mills have been shut down and stocks of Rods at makers mills and in consumers' hands are quite light. Jobbers report a good trade in Wire Nails, which is probably due to some extent to the long-talked-of advance in price that now seems to be imminent. They continue to sell small lots at $1.55 from stock, but will shortly make an effort to advance this rate to $1.60. They state that manufacturers are slower than ever in shipping some sizes, showing that stocks are badly broken.

Cut Nails.—Business in Cut Nails is moderate, the trade limiting their purchases to early requirements. The market is, however, steady in price, the mills refraining from making special inducements to secure orders. Quotations are on a basis of $1.05 for carload lots at mill, concessions being made only in special cases and particularly where the average is unusually attractive.

Advices from Chicago.—Some Wireers report a fair business in Cut Steel Nails and excellent prospects for an enlarged trade. Inquiries have been numerous of late and stocks are found to be so low in dealers' hands that an early movement must soon come. They continue to quote factory lots at $1.20 to $1.25. Small lots from stock are selling at $1.30.

Barb Wire.—This market continues sluggish, with a light demand. There are, however, indications of slight improvement in this regard. Quotations remain on a basis of $2.45 to $2.50 for carload lots at mill for Four-Point Galvanized, but in some exceptional cases this figure is slightly shaded.

Advices from Chicago.—Inquries are is steadily improving. The fall trade may not be so large as usual, but prospects are much better than they have been, and at least a fair volume of business is expected. The manufacturers of high-grade Barb Wire are not all making low prices and claim that they find it unnecessary to do so. Quotations range from $2.45 to $2.60 on Galvanized, according to the size of the order.

Cordage.— During the past week there have been no important developments in the Cordage market. The demand is only moderate and prices are maintained on a basis of 8 cents for Manila, 6½ cents for Sisal and 6¼ cents for New Zealand in large lots at factory or New York. On smaller parcels such as are purchased by the trade generally the usual advances are made. During the present month many rumors have been current in regard to Cordage in-

terests and efforts which have been made to come to some agreement in regard to prices. Many of these rumors are entirely without foundation. The fact is that the product of the plants operated by the National Cordage Company is marketed by the receivers, and at prices which are substantially the same as those made by the independent and outside companies. The report referred to in a recent issue that the National Cordage Company had made an arrangement with John Good to restore prices to a basis that would give a difference of 4 cents per pound between the raw material and the finished product turns out to be unfounded. Such a difference is obviously excessive, and an attempt to establish prices on any such basis would unquestionably result in the encouragement of formidable independent competition.

Self-Heating Washer.—This article was described in a recent issue. It is put on the market by the Self-Heating Washing Machine Company, Evansville, Ind., and is sold to the trade at $7.50 each, terms 60 days net or 2 per cent. off in 10 days.

Gas and Pipe Pliers.—Barnard's Gas and Pipe Pliers, illustrated in this issue, are manufactured by the Wm. Schollhorn Company, New Haven, Conn., for whom Julius Berbecker & Co., 65 Duane street, New York, are agents. The Pliers are sold at the following list, subject to a discount of 35 per cent. in small quantities, and 40 per cent. discount in gross lots:

4½	5	7 inch.
$8.50	9.50	12 per doz.

Old Rubber.—No new development of business has yet appeared in the market for this material, which continues very dull. The following quotations are approximate for New York delivery :

Car Springs, ton lots, ℔ lb.	....	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb..	....	@	.03
Rubber shoes, less than carloads	2¼	@	.03⅛
Large Hose, ℔ ton	....	@	9.00
White Wringer Rolls, ℔ lb.	....	@	.04¼
White Syringes, ℔ lb.	....	@	.05

Old Rags, Paper, &c.—Only a moderate business is reported. Prices remain at about the following figures, delivered in New York :

No. 1 White Rags ℔ lb	3½	@	3¾¢
No. 2 White Rags ℔ lb			1¾¢
Mixed Rags ℔ lb			1 ¢
Blues and 3ds ℔ lb			1 ¢
Hard Sized White Shavings ℔ lb			2½¢
No. 1 White Book Shavings ℔ lb	2½	@	2¼¢
No. 2 White Book Shavings ℔ lb			1¼¢

No. 1 Manila Paper ℔ lb	1	@	1⅛¢
No. 2 Manila Paper ℔ lb	⅝	@	¾¢
Bogus Paper ℔ lb	⅝	@	¾¢
Common Paper ℔ lb	¾	@	½¢
Straw Chips ℔ lb	½	@	⅝¢
Binders' Clippings ℔ lb	½	@	⅝¢
Jute Butts ℔ lb			1 1-10¢
No. 1 Jute Bagging ℔ lb			1¼¢
Mixed Bagging ℔ lb	¾	@	1 ¢
No. 2 Bagging ℔ lb	½	@	¾¢
Hemp Twine ℔ lb			2¼¢
Manila Rope ℔ lb			2½¢
Jute Rope ℔ lb	1½	@	1¾¢
Mixed Rope ℔ lb	¾	@	⅞¢

Old Metals.—Prices for Old Metals are irregular and can only be quoted approximately. The demand, however, has improved. Mills which have been out of the market for some time are looking for old Scrap Iron, and picking up what they can get at bottom prices. The following are about the prices now ruling in New York :

Heavy Copper ℔ lb		8¾¢
Light and Tinned Copper ℔ lb		7½¢
Heavy Brass ℔ lb		6¢
Light Brass ℔ lb		5¢
Lead ℔ lb		3¢
Tea Lead ℔ lb		2¾¢
Zinc ℔ lb		2¾¢
No. 1 Pewter ℔ lb		14¢
No. 2 Pewter ℔ lb		7¢
Wrought Scrap Iron ℔ gross ton	$12.00 @	$14.00
Heavy Cast Scrap ℔ gross ton,		8.50
Stove Plate Scrap ℔ gross ton,		5.50
Burnt Iron (delivered at mill) ℔ gross ton		6.75

Trade Notes.

THE DODGE MFG. COMPANY, Mishawaka, Ind., issue a souvenir pamphlet of the World's Columbian Exposition. The publication, of oblong shape, is prettily gotten up, being bound in tinted paper and the letterpress is in brown ink. The illustrations begin with views of the works of the company in 1878, 1882 and 1893, which show the evolution from a small two-story square wooden building to an enormous factory plant covering four sides of a square. The illustrations that follow show wood split Pulleys in all sorts of forms, Pillow Blocks, Shafting, Clutch Pulleys, Belt Tighteners and other goods, the articles being described in the text. These souvenir pamphlets will be distributed on application.

UNDER the head of Special Notices a large furnace manufactory doing business in the West offers its business for sale. They very pointedly state that they do not sell because of "poor health," a "desire to retire," or any other fakish reason. They claim they have no old stock, bad debts or embarrassing circumstances, and state the business can be had at a bargain.

THE WESTERN BRASS MFG. COMPANY, St. Louis, Mo., whose plant was recently greatly damaged by fire, announce to the trade that they are still in shape to fill all orders promptly. They have provided themselves with a temporary office at 606 Market street, St. Louis.

THE FORMATION of a Canadian corporation whose operations will cover a wide range of business is thus announcd by the Montreal *Gazette*: "Letters patent of Canada have been issued incorporating William Clendinneng, founder; William Clendinneng, Jr., founder; Erastus William Wilson, accountant; Frank Brown, agent, and Ulric Beaupre, founder, of Montreal, for the purposes of manufacturing and dealing in Pipes of all kinds, Fittings, Castings of all kinds, Boilers, Steam Fittings, Plumbers' Fittings, Elevators, Stoves, Ranges, Furnaces and Fittings of all kinds, Cooking and Heating Utensils of all kinds, Building Metal and Wood Works, Stable Fittings, Wooden and Metal Household Furniture, Machinery and Machine Fittings of all kinds, Wooden and Agricultural Implements, the operations of the said company to be carried on throughout the Dominion of Canada by the name of the William Clendinneng & Son Company (Limited), with a capital stock of $500,000."

JENKINS BROS. of 71 John street, New York, recently received a letter from a customer in Brazil, who said that he had found the Globe, Gate and Angle Valves used by him were higher in quality than claimed by the makers. He had used the Standard Packing, also furnished by Jenkins Bros., in packing the joint in a steam dome which had always given much trouble. This Packing worked perfectly, and the correspondent thought it "worth its weight in gold."

THE SALEM MINERAL WOOL COMPANY have been chartered by John A. Bartlett of Roanoke, Va., and others, to build and operate a mineral wool plant at Salem, Va.

THE MCCULLOUGH IRON COMPANY'S plant at North East, Md., was put into entire operation this week, with 300 men, after a short spell of only partial work.

FERRACUTE MACHINE COMPANY, Bridgeton, N. J., have reduced the wages of their employees 10 per cent. on account of the depression of business.

THE FACTORY of the Lalance & Grosjean Mfg. Company, at Woodhaven, L. I., was started up again this week after a briefer shut down than was anticipated. The establishment will be run on half time for the present.

CLEVELAND ROLLING MILL COMPANY have started up about one-half of their plant, and it is stated that they will soon be giving steady employment to fully 3000 men.

GRISWOLD MFG. COMPANY'S factory, at Erie, Pa., has been running right along with plenty of orders. A part of the machine shop and molding room were shut down for a few days in order to make some alterations in fittings, which gave rise to an unfounded report that the entire establishment had suspended operations.

THE PHELPS METAL COMPANY of Syracuse, N. Y., are a new corporation which has been chartered at Albany for the manufacture of Cutlery, Hollow Ware and specialties, with a capital of $50,000. The directors are E. E. Phelps, Chas. S. Roberts, W. C. Brayton, Frederick A. Paul and Helen A. Palmer, all of Syracuse.

THE NEW BEDFORD COPPER WORKS, New Bedford, Mass., started their plant on Monday, after a temporary shut down.

THE MISSOURI STOVE & HARDWARE COMPANY, of Kansas City, Mo., have been chartered, with a capital of $10,000.

THE MARTIN HEATING COMPANY, St. Paul, Minn., have filed articles changing their name to that of the Archambo Martin & Morsk Company.

J. H. Demmler, the founder of the works of the United States Iron & Tin Plate Mfg. Company, at Demmler Station, a few miles from Pittsburgh, died on Saturday, the 26th ult., at the residence of his son-in-law, F. E. Schenck, in the East End, Pittsburgh. Mr. Demmler was in the 85th year of his age, and his death was due to general debility. He was born in Germany, but came to Pittsburgh early in life and for a number of years conducted a tin store on Liberty street in that city.

News and Notes.

Nova Scotia produced last year 1,942,782 tons of coal and 75,000 tons of iron ore.

The Massachusetts Institute of Technology has established a course of study in naval architecture. Heretofore this subject could only be studied by a visit to the technical schools of Europe.

A circular letter from Charles Lyman, president of the United States Civil Service Commission, Washington, D. C., states that there is a demand for more fourth assistant examiners in the Patent Office than the Civil Service Commission is able to supply, as the examination can only be passed by those who have an advanced education in the sciences. The subjects of the examination are: Physics, technics, mathematics and chemistry, and mechanical drawings. A pamphlet containing sample questions, and also containing the dates and places at which examinations may be taken, will be furnished to those who desire to become applicants. The salary of the position is $1200 per annum.

An estimate made by the London *Times* places the net loss experienced by the failure of crops this year in Great Britain, due to the prolonged drought, at not less than £2 per acre, or about $336 000,000 on the spendable income of England. A further estimate of the losses for last year and this shows that the aggregate reduction in the income of farmers throughout the United Kingdom from crop failures alone comes to a little over $504,000,000. This is a sufficiently serious state of things, and it is not to be wondered at that money is reported as scarce and trade as very bad in the agricultural districts.

Cable dispatches from England report that the scarcity of coal, caused by the great strike, is being keenly felt at British ports. Many steamships which have coaled regularly at London are now taking in their supplies at Continental ports, and it is likely that the Atlantic liners will be compelled to draw their fuel almost entirely from American sources.

The *Journal des Mines* has published some interesting statistics of the world's coal fields. From these it appears that of the entire known coal area the United States has 58.7 per cent., and British America has 13.1 per cent., while England has but 2.8, and Spain, France, Germany and Belgium have together 1.9 per cent. The total production of coal in 1891 is estimated to have been 520,000,000 tons, of which 150,000,000 tons was produced in the United States.

The great fire which devastated South Chicago last week embraced in its area of destruction the dwellings of most of the employees of the Illinois Steel Company.

Baltimore wants a ship canal across the Eastern Shore peninsula.

On August 24 the national bank note circulation of the United States for the first time passed the $200,000,000 mark. The increase since January 1 has been more than $30,000,000.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

A good TIN and SHEET-IRON WORKER; one accustomed to roofing, spouting and pump work; none but steady men need apply. Lee & Bunce, Riverhead, Long Island, N. Y. Sept. 2

An experienced FOREMAN in steel range, tin, copper and sheet-iron ware factory. "Range," office of *The Metal Worker*, 96-102 Reade street, New York City. Sept. 2

One or two middle aged, steady, reliable men, experienced in tin, sheet iron, range, furnace and general jobbing work; good position to good men. Canfield Stove Company, Rondout, N. Y. Sept. 2

A good jobbing PLUMBER; one who can do gas fitting and tinning also; to a sober and steady young man who is not afraid to work I can offer steady job the year round; prefer one who has formerly been a Nova Scotian; state experience. J. N. Dauphine, 98 Dean street, Providence, R. I. Sept. 2

Good men in any of the States west of Ohio, including Ohio, to sell a good line on commission; any one desiring to carry a side line please write us for particulars, at the same time stating what line you are handling now. Lock Box 364, Peoria, Ill. Sept. 2

SALESMAN thoroughly acquainted with retail hardware and tinware trade to represent a manufacturer in each of the following States: Iowa, Michigan, Minnesota, Indiana, Wisconsin, New York, Illinois, Missouri, Pennsylvania, Ohio, Nebraska, Kansas, Massachusetts; must furnish first-class references. Trade Drawing School.

The General Society of Mechanics and Tradesmen of New York will open on the evening of October 5, at 18 East Sixteenth street, the regular session of its free drawing school. These classes are open to young men over 16 years of age connected with the trades who desire by the facilities offered in drawing to gain a better knowledge of their particular trade. The necessary application blanks can be obtained from any member of the committee or on application at the school. The applications must be filed by September 15.

Is the Corner Turned?

The doleful tale of trade depression and tight money which has been the prevailing topic in business circles for so many weary weeks has at last given place to a more cheerful strain of talk. Dating from the day on which the House of Representatives decreed the repeal of the Silver Purchase law, an improvement in the business situation has been apparent. Reflected at first in an easier money market, the better feeling has been expressed in Wall street by the recovery in the value of almost all securities. In the present week these encouraging signs have continued. The premium on currency has disappeared and money which had been loaned out of town by New York banks during the pinch is now flowing back from the interior. The banks of the financial metropolis have replenished their coffers and are able to supply the needful funds for moving the grain and cotton crops as well as for all the necessities of their customers. Besides these evidences of easier money, reports of financial institutions re-opening their doors for business and of mills and factories starting up again after shut downs of varying duration are now outnumbering the lists of banks and industries suspending or closing down, which had become such miserably monotonous reading a week or two back. The large volume of enforced idle labor is being gradually reduced by the re-opening of works which are constrained to start their wheels again to fill orders coming in. Trade reports, too, speak of increased demand for goods in many lines of manufacture, pointing to returning confidence among consumers.

The Labor Congress.

The great labor congress held in Chicago last week was well attended by "reformers" of more or less eminence from many countries. The symposium of labor theories, however, failed to crystallize into any practical measures for the real benefit of workingmen. There were plenty of so-called economists, with all sorts of schemes guaranteed to usher in the millenium, if they could only be universally adopted, but the trouble with nearly every theory propounded was that existing forms of government or existing institutions of society would have to be completely overturned first. A profound truth was uttered by Bishop Fallows of Chicago, when he asserted that in this country there is no class and no distinction between classes and masses, but the trouble is that his hearers have been educated or have educated themselves to think otherwise, and he probably made no impression on them. They regard workingmen as a distinct class and think that it is possible to do something to better their condition in the lump. The great fact is ignored that every man must work out his own salvation. If he would rise, he must simply work and save.

International Sanitation.

Some important points of international sanitary procedure which were agreed to by representatives of the principal European powers at the recent Sanitary Congress in Dresden are worthy of note as showing that the modern scientific tendency in the matter of quarantine regulations and general sanitary law is not to hamper commerce and travel by the imposition of unnecessary and vexatious restrictions, but to apply sanitary precautions intelligently, in accordance with proved facts in regard to the spread and prevention of contagious and infectious diseases. Only such restrictions as are indispensable for the public safety should, it is believed, be enforced. The congress referred to was held with the view of arriving at some uniform system of sanitary procedure, and their deliberations have resulted, among other things, in an agreement on two prominent points. First, that in the case of infected ships persons on board and still in health should be detained not more than five days after the occurrence of the last case of cholera, and that vessels should be judged by their actual sanitary condition, not by the condition of the ports from which they sailed. It was also settled that rags, in the form of merchandise, have never conveyed cholera, and that shoddy and certain suspected German wools are not carriers of infection. Coming from a representative gathering of leading scientists these opinions must be held to be weighty. It is noticeable that all the more enlightened nations have joined forces in the matter—namely, Austria-Hungary, Belgium, France. Germany, Great Britain, Italy, the Netherlands, Russia and Switzerland, while Denmark, Sweden and Norway are believed to be on the point of joining in the agreement. The dissentients were Greece, Turkey, Spain and Portugal.

A Compulsory Reform.

This country is approaching slowly, but surely, a period when present modes of living among those who sustain themselves by manual labor must undergo reform. The effort to imitate, as far as their means will allow, the dress and style of those possessing more ample means, will be abandoned from the sheer impossibility of maintaining it. The result will be complete relief from many burdens now carried with anxiety and toil, and a lighter, happier lot than now falls to the share of most people who gain their bread by sweat of brow. The struggle to follow the lead of fashion and to obliterate external indications of difference in wealth falls, by its very nature, wholly upon the poorer classes. In such a struggle they exhaust resources that could otherwise be husbanded for hard times like the present; and do what they may in such a struggle, there always remains the unpleasant consciousness of defeat. Before the working population of any land can emancipate themselves from the slavery of poverty they must first break the shackles of false and foolish pride, and recover that true pride which only renders them ambitious to rank first among those in their own station—pride of citizenship, pride of superiority in their chosen handicraft, pride in a manly independence as admirable in a peasant as it is in a king.

The World's Fair Buildings.

How to dispose of the World's Fair buildings in Jackson Park without paying for their removal is just now beginning to trouble the exposition management, and Director of Works Burnham has been ordered to estimate the salvage value of every iron girder and stick of timber in the buildings. It

appears almost incredible that the main exhibit buildings alone, which, according to Auditor Ackerman's July monthly report, have cost $7,019,205, should be without value at the close of the exposition. At one time it was thought by the directors there would be a reasonable amount of salvage, but the estimates gradually dwindled to $1,000,000. That was low indeed, but some of the directors now say they will be lucky if they do not have to pay for the removal, including the gift of the material of the $7,000,000 group of structures. The Administration Building, for instance, has cost $463,212, and now it is estimated that it would be worth the donation of the entire building and a fee of $10,000 in addition to remove it and leave the ground in the condition stipulated by the South Park Commissioners, from whom Jackson Park was leased. Manufactures Building cost $1,172,431. Its stupendous iron trusses, 250 feet high, do not seem to be in demand. Agricultural Building represents $659,234, but nobody wants it. The same is true of other structures, for not a single offer to purchase has yet been tendered. The same conditions existed, however, at the close of the Centennial. There was no immediate demand for the structural material, but the contractors who were able to purchase it and hold it found opportunities to work it off at a good profit. Centennial buildings were reproduced in whole or in part in widely scattered sections of the country.

New Tin-Plate Decision.

The long-delayed statistics of the tin-plate production in the United States for the quarter ending March 31, 1893, have finally been made public, showing that the three months' product was about 30,000,000 pounds, of which some 40 per cent. were made from American black plates. The production for the June quarter is estimated at 35,000,000 pounds, making the total production for the fiscal year equal to 100,000,000 pounds. The Treasury Department at the same time promulgates an important decision, which we print in another column, affecting the statistics of the industry. As we mentioned recently in these columns, the former Secretary of the Treasury decided that plates coated in this country, irrespective of their place of original manufacture, should be classified as American tin plates. This decision has been under careful consideration by the present administration, and the result of their investigations is to reverse the decision and hold that tin plates made from imported black plates are not produced in the United States within the meaning of the Tariff act of 1890. According to the latest figures this will reduce the American production over one-half, and will render it more difficult to bring the domestic product up to one-third of the imported quantity as required by the law if the present duty is to be continued after 1897.

Impending Scarcity But no Boom

The disordered state of trade through which we are now passing is leading to some peculiar results that are worth noting. Branches of business in which stocks are periodically accumulated to meet heavy demands, according to the season, will be seriously disorganized by the heavy curtailment in production which has been forced alike on the establishments with abundant capital and those with but slender resources. The shrinkage of output as compared with normal periods has been enormous. In the stove trade, for instance, those who have the best facilities for gathering information estimate that in July and August about three-fourths of the stove producing capacity of the country was inactive. The reduction in output was not less than 10,000 stoves daily, making an aggregate shrinkage of at least 500,000 stoves in the stocks which in ordinary seasons would be in makers' and dealers' hands at this time of the year. The financial stringency struck the stove trade just at the time when makers are driven, endeavoring to accumulate heavy stocks for their period of most active sales. Among makers of agricultural implements the same serious interruption to the business of great establishments has occurred. Manufacturers of hardware have been forced to suspend in the same way, regardless of the necessity of carrying full stocks in their warehouses to meet the certain requirements of jobbers and consumers. Inconvenience is even now experienced in securing full assortments of goods in some lines.

Granting that the purchasing power of the people may be restricted quite considerably, there will be some demand for goods that must be met. Wear and tear and waste go on and consumption never completely stops. The very heavy curtailment in production has been carried by the financial stringency far beyond the limits of a mere trade depression caused by overspeculation or overstocks. This has deranged the whole chain of distribution, so that temporary scarcity of many kinds of commodities seems inevitable. It has already occurred in the sugar trade in many localities. The same influences curtailed production and the accumulation of stocks in that line as all others, and, now that the season of an enlarged consumption of sugar has set in, there is a sudden scarcity. There may be no sugar famine and prices may be kept down as a matter of policy at this time, but considerable inconvenience is experienced and merchants are harassed by the appeals of their customers for more than can be spared if every one is to get a fair share.

The closing of so many rolling mills is already causing trouble among certain classes of consumers. They are unable to get the exact shapes, sizes and lengths they need, and are hindered in construction which they are extremely anxious to push to completion. On this account some complaint is made that mills are being closed for effect and not because of the slack demand. The fact is overlooked that the aggregate of such business is now small and that mills will not start up nor put in special rolls merely to make a few tons. The railroad companies that have deferred purchasing rails for renewals, but must do some repairing of track before winter sets in, are likely to find themselves unable to get rails just when they want them, now that all the rail mills are shutting down, with the prospect of remaining closed until well along in the new year.

It will be strange, indeed, if the restricted output of Lake Superior iron ore this season is not felt by the Northern iron trade before navigation opens next spring. The falling off in shipments from the mines has been so heavy that the stocks of unsold ore at lower lake ports will be very light when winter sets in. The production of pig iron will not be wholly suspended, nor will the demand long continue as light as at present. Stocks will be drawn upon, and before spring not a few furnacemen will be looking for ore and finding none available.

The presentation of such statements as the above might be deemed preliminary to the prediction of a boom in prices, but it is almost certain that there will be none, even if a decided scarcity of commodities and raw materials should be perceived on all sides. Consumers are not and will not for a long time be in a position to pay a premium on their purchases. They will expect to buy at low prices or they will go without the article needed. Scarcity is not the only requirement for a boom. There must at the same time be an easy financial condition and a fair degree of confidence in the future. These elements are lacking now and are not likely to be of very rapid growth. It will take longer than a few months to get back to where we were even in the uneasy times of last April and May.

A novelty in postal cards is about to be introduced in France. The cards will be issued in the form of check books, with stubs. The sender of the postal card can make memoranda of its contents on the stub, and can have this stamped at the post office before the card is detached, so that a verified record of the correspondence can be kept.

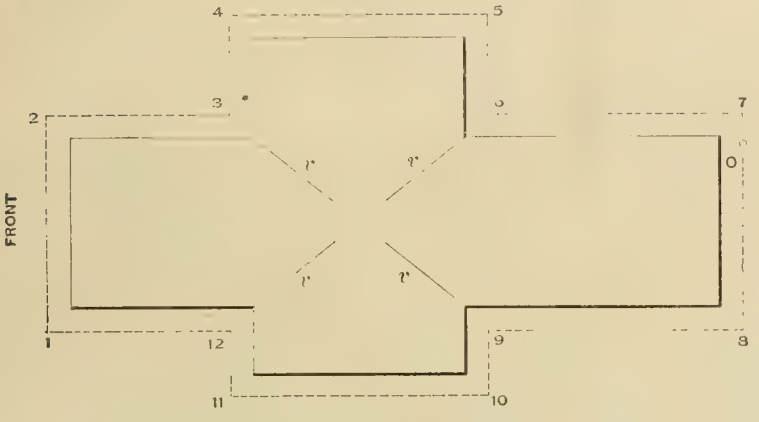
The Thompson-Low Company of New York City were incorporated at Albany on August 31, with a capital stock of $750 to manufacture machinery for the washing of domestic utensils.

Of 365 schools in England built by the Public School Board 230 have been found unhealthy by a sanitary commission lately appointed for their inspection.

ROOFING AND CORNICE.

Roof with Single Leader Pipe.

From N. D., *Portland, Ore.*—I wish to make a few suggestions regarding the gutter with which "D. G.," New Hampton, Iowa, has had some difficulty, as shown in *The Metal Worker* of April 8. The gutter should be almost level for some distance from the starting point and then made to incline toward the outlet, this last half being enlarged if possible. The inside miters, as 3 or 6, should be made rounding or "octagon," as shown in Fig. 2, which would help the flow of water to a considerable extent. In this figure A B C D E F G represents the gutter in plan and J K in profile. By placing the gore piece as indicated by F H E the trough would be wider at the bend. I would suggest that upright pieces of tin or guards be soldered to the bead of gutter at the inside miters 6 and 9. The pieces, as shown in Fig. 3 by L M N, could extend each way from 18 inches to 2 feet and be 2 or 3 inches high at the center M, tapering each way to L and N. If desired the miters at 6 and 9 could be made as indicated in Fig. 2 and provided with guards similar to Fig. 3, being bent so as to conform to the shape shown by G F E D of plan.



Roof with Single Leader Pipe.—Fig. 1.—Plan of Roof.

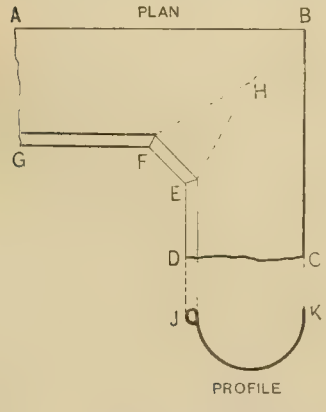


Fig. 2.—Proposed Form of Inside Miter.

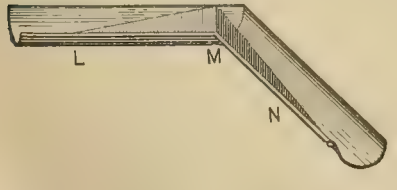

Fig. 3.—Guard for Inside Miter.

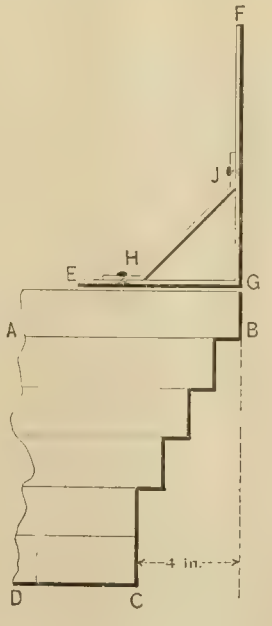
Cornice Construction.

From B. C. B., *Brooklyn, N. Y.*—I have a cornice to make in which is a panel having a semicircular top 38 inches wide and 19 inches high. About this panel is to be placed a round bead or pipe. From what material should this pipe be made, and how can it be constructed without raising? The cornice sets on a brick wall having a 4-inch projection, as shown in the accompanying sketch. How should the iron lookouts for cornice be constructed so as to relieve the face of wall from the weight of the cornice?



Cornice Construction.—Sketch Submitted by "B. C. B."

Answer.—It is probable the pipe or bead can be made from galvanized iron or copper, and then bent to the desired shape, directions for which operation are to be found in *The Metal Worker* of April 29, 1893, page 48. The construction of brick wall on which the cornice is to rest is shown in the accompanying engraving by A B C D. The bottom of lookouts can be bent so as to extend back over wall, as indicated by E G F. If greater strength is required, braces similar to H J can be riveted or bolted to the lookouts.

FLASHINGS.

JAMES B. SCOTT & Co., Pittsburgh, Pa., are distributing a special circular relating to their steel roofing. The first paragraph relates to Scott's double-seam roof steel roofing. Then reference is made to corrugated roofing, siding and ceiling, pressed standing-seam roofing and V-crimped roofing. Notes are made of these various products and illustrations are given of their appearance.

IN THE very handsome volume entitled "The Industries of Springfield, Ohio, and Environs," there appear many interesting articles relating to the different manufacturers in that neighborhood. One of the firms to whom particular attention is given is T. B. Peet & Co., manufacturers of galvanized iron cornices, at 28 South Fountain avenue. The firm were established in 1874, and since the death of the senior member have been conducted under the management of Christian A. Schuster, the surviving partner. The products consist of galvanized iron cornices, building fronts, finials, crestings, ventilators and chimney caps, skylights, window and door trimmings and ornamental iron work generally for buildings. The firm make their own designs and drawings, which will be submitted upon application, or they manufacture after architects' plans and specifications. They have done work on many important buildings in Ohio, and are prepared to undertake the largest contracts.

A PRESS DISPATCH of September 6 from Bennington, Vt., states that the slate manufacturers of Granville and vicinity have agreed to shut down all the quarries October 1 for an indefinite period, or until there is a demand for slate.

A corporation with a capital stock of $500,000 was chartered at Trenton, N. J., last week for the purpose of damming the Delaware River near Trenton to secure power for the operation of a large electric plant to supply power to Trenton and Morrisville. The title of the corporation is the Pennsylvania & New Jersey Power Company.

THE LETTER BOX.

Area of Roof.

From H. F. M., *Frankford, Pa.*—Will *The Metal Worker* kindly inform me of the shortest method for obtaining the number of square feet in a roof when inches are involved in the measurements? My way is to reduce feet to inches, multiply, and divide by 144. This is a laborious process, and consumes considerable time when a number of roofs are to be estimated.

Answer.—A convenient method for obtaining the area of a square or rectangular surface is by the use of the duodecimal system, which is the same as the decimal, only 12 units are used in the place of 10. By the use of this system dimensions in feet and inches can be added, subtracted or multiplied, as may be desired, the scale always being 12. The foot is taken as the unit, and can be indicated by ft. or the sign °. The foot being divided into 12 equal parts, one of these parts is called an inch or prime, and marked ′. The inch or prime being divided into 12 equal parts, one of these parts is called a second, and marked ″. The second being divided in a similar manner into 12 equal parts, each part is called a third, and marked ‴. From the above we can form a table of values, which is as follows:

12‴ (thirds) = 1″ (second) or $\frac{1}{12}$ inch.
12″ (seconds) = 1′ (prime) or inch.
12′ (primes) = 1° (degree) or foot.

The marks ′, ″, ‴, which are used to denote the fractional parts of a foot, are called indices. The operation of multiplication by the use of duodecimals is performed as follows: The multiplier is to be written under the multiplicand so that units of similar value shall be under each other. Beginning with the lowest order of units in each, multiply each term of the multiplicand by each term of the multiplier. Each product is to be reduced to higher denominations (by dividing by 12) and written in its proper place. The sum of the partial products will be the product required. To determine under which division two sets of figures come when multiplied together, it is only necessary to add the indices. Thus 1° × 1′ = 1′, 1′ × 1′ = 1″, 1′ × 1″ = 1‴, &c.

Supposing we have a gutter 56 feet and 9 inches long by 14 inches (or 1 foot 2 inches) wide, and we wish to obtain the number of square feet in same. The operation would be performed as follows:

56°	9′	
1°	2′	
9°	5′	6″
56°	9′	
66°	2′	6″

In the above example the multiplier is written under the multiplicand so that units of similar value shall be under each other. Now to perform the above example, 2′ × 9′ = 18″, and 18″ divided by 12 (to reduce to next higher denomination) = 1′ 6″; we put down the 6″ and carry 1′; 2 × 56° = 112′ and + 1 = 113′; 12 goes into 113 9 times and 5 over, so we put down the 9° and 5′ in their proper places.

The next operation is to multiply 56° 9′ by 1°: 9′ × 1° = 9′, which is put under the 5′; 56° × 1° = 56°, which is put under the 9°. By addition we find the sum of the partial products to be 66° 2′ 6″.

Town Sewerage.

From E. G., *Delaware.*—I wish to ask a few questions through *The Metal Worker* in regard to town sewerage. What are the best pipes to use, and which are the cheapest? What is the best way to connect house drains with them?

Note.—Sewers are usually built of brick and cement. When a drain pipe is connected a hole is cut in the sewer and the pipe inserted and carefully cemented tight. Terra-cotta pipes are sometimes used, when there should be a branch for each drain pipe that runs into it, and all joints and connections should be carefully made with good cement. Very frequently, though it is bad practice, a hole is cut in the side of the main pipe and the drain pipe inserted. This is the only way a connection can be made when no branch is provided. Cast-iron pipes possess many advantages and their superiority is recognized by the regulation of many cities requiring that only cast-iron pipe shall be used inside of a building. The connection of cast-iron pipes is made by calking the hub tight with oakum, then pouring in hot lead till the remaining space is full and driving it in tight and spreading it with a calking tool and hammer. It is probable that the first cost of the terra-cotta pipe is less than either cast-iron pipe or a sewer.

Relay or Relief in Pipe Fitting.

From W. J. Y., *Raleigh, N. C.*—In looking over the plans and specifications for a steam heating plant, this clause is found: "Wherever a reducer is used on a line of steam pipe a relay must be put in." The question is, what is a relay? I take it to mean a bleeder or drip pipe to drain the steam pipe of water that would accummulate when the main pipe is graded from the boiler and a reducer is used. Am I right?

Answer.—Our correspondent is right in his conclusion. Bad penmanship might cause the word "relief" to look like "relay," or the person who copied the specification not being a practical man may have used the wrong word.

Plumbago.

To correct the impression given to "E. D. S.," Newman, Cal., in *The Metal Worker*, August 26, further inquiry among the importers and dealers discovers that the value of the best quality of graphite is nearly double the price given, or about 4 cents per pound.

Squared Roofing Tin.

From J. L., *Plymouth, Pa.*—I have read the letter of "W. H. B.," in *The Metal Worker* of September 2, in regard to the turning of edges on roofing plates by the manufacturers. I do not think there would be much advantage gained by it, for this reason: Roofing plates are used in most shops for many purposes besides the laying of flat-seam roofs, and if the edges came already turned it would be frequently necessary to turn them back again or trim them off, causing a waste of time and material. Now, while not recommending the turning of edges on roofing plates, I think it would be a good idea if manufacturers would notch the four corners of the black sheet before tinning. This would not materially injure the sheet for other work, while it would tend to make a better roof. Every tinner knows that when tin is notched the raw edges of the plate are exposed and the slightest dampness causes them to rust, making it very difficult to solder.

Street or Tank Supply.

From W. N. P., *Maine.*—I have several coils to put in furnaces to heat one or two far off rooms with hot water and would like to know whether they would work and do good service if connected with the street supply instead of a tank. Our city pressure is about 100 pounds to the square inch. I presume a tank is better, but what objection, if any, is there to connecting with the street supply.

Note.—There are water heaters in operation giving good results connected with the street supply. When the heating capacity of the coil is somewhat in excess of what is required for the radiators, the hot water is likely to run back in the supply and furnish hot water at some of the cold-water faucets. If the water supply in the street is shut off, as is often done for repairs, the system may be left without a proper supply, unless a check valve is placed to prevent it, but the use of the check valve, however, makes some provision for expansion necessary. The use of a tank is regarded as a remedy for many minor troubles and is quite general.

Boston Plumbers' Paste.

From S. U. B., *New York.*—Please give me the recipe for making paste for use in wiping joints, such as they use in Boston. I don't mean the common paste in general use.

Note.—We cannot supply this demand, but trust to some of our readers in Boston to send in the desired information.

Capacity of Tanks.

From D. C., *Dexter, Maine.*—If "B. B.," Passaic, N. J., whose inquiry appeared in *The Metal Worker* August 19, will paste up in a conspicuous place the following rule for finding the contents of round tanks he will find it to be very handy and correct: Multiply the diameter in inches by the diameter, that by the depth in inches and then by 0.0034. The result will be the exact number of gallons and fractions of gallons. For instance, a tank 20 inches in diameter and 18 inches high would hold 24.48 gallons, which answer is obtained in the following way: $20 \times 20 = 400 \times 18 = 7200 \times 0.0034 = 24.48$.

Heating a Room From Range Boiler.

From J. R. F., *Connecticut, and* J. Q. B., *New Jersey*, we receive letters asking respectively for the best method of heating a bathroom from a water front and if a kitchen boiler can be utilized for heating a bathroom by means of connecting pipes between the boiler and a radiator in the bathroom.

Answer.—To consider the last question first, the answer is yes. To answer the first question, there are some simple rules that must be positively observed and will apply to the average case. It is assumed that the water back and stove have ample reserve power to heat the extra amount of water needed. In cases where the bathroom is directly above the stove it will not be a hard room to heat, and 1 square foot of radiating surface to every 40 or 50 cubic feet of space should prove satisfactory. The radiator must have an air cock at the top to let the air out when water is let into it. As a precaution against getting rusty water into the boiler use lead pipe or preferably ¾ or 1 inch galvanized iron pipe, connecting it with the hot-water service pipe at the top of the boiler and running direct to the radiator. There must be no decline or horizontal runs in this pipe, but a positive inclination upward maintained all the way. This is to let air pass to the radiator and escape through the cock and to provide for an unobstructed flow of water. Another pipe of the same size must be as carefully returned from the radiator to the boiler and connected with the pipe at the bottom of the boiler that runs to the water back. A stop cock should be placed in both the flow and return pipes of the radiator to prevent circulation through them in summer when the heat is not needed.

Water Heater for Cattle.

From O. T. B., *Clinton, Mass.*—Please ask through the Letter Box if there is anything on the market that can be used to burn oil or charcoal for heating water in a tank for cattle; something that can be set in the tank and removed without trouble.

Contaminated Well Water.

From D. C., *Dexter, Maine.*—The trouble with "J. H.," Richmond, Maine, who complains about a well in *The Metal Worker* of August 19, is angle worms. Let him send to Portland, Maine, to W. Winslow & Co., and get 6 feet of 24-inch well pipe, take up the stone work and put the pipe in place of it with the flange end down. Tamp the dirt outside of the pipe as hard as possible. Clean the well, washing in between the stone. By doing this I think he will have no more trouble. It is a good plan to cement out a foot all around where the pipe sets on the stone work.

Making Traps.

From F. H. A., *Pennnsylvania.*—Would you please inform me through the Letter Box how to cut out and put together a 1½ inch P-trap?

Note.—As handicraft is the principal requirement in such work it is difficult to describe, and if any old craftsman can give better instruction than is given here, no doubt it will be appreciated by many readers. Cut out two pieces of sheet lead half as wide as the circumference of the trap and long enough to fill the dimensions required after the bends are made. Form them half round over a piece of pipe and at a point where the throat bend is to be made, press the sides out, and make the throat bend. Then, by continual tapping with a bend pin or piece of round iron, while keeping the bore half round, drive the sides into place. The butt of the trap is made in the same way, and when the work is so far advanced the two parts should be fitted just as if the work was completed before making the next bend. This is one of the jobs that can be learned better by observation than by reading a description of it. After the bends are made and the parts are fitted the soldering is a simple matter. Plenty of solder should, however, be used. Some make a very fair trap by using a rubber pipe bender or a wire spring in a piece of lead pipe, but even in this way of making a trap the tapping and some skill is required. It is needless to point out that all ordinary forms of traps of all ordinary sizes can nowadays be bought of dealers to much better advantage than they can be made in the shop.

Suggestion to Apprentices.

From S. H. B., *Geneva, N. Y.*—Although what I have to say is not about working metals, I think it will be of interest to many of your readers. I have often noticed workmen in the shop with the heels of their shoes worn off at the side or back. If taken to a shoemaker it will cost 25 cents or more to have them fixed, and if not repaired the shoe will soon be ruined. I have seen in some place a kind of heel plate, made of malleable iron, crescent shaped, with projecting prongs on one side to fasten to the shoe heel. If, when a heel is slightly worn, one of these plates is put on it will level it up and prevent further wear. They are very cheap and cost not more than 5 cents a pair and will save at least five times their cost. Would it not be a good plan if the shop boys would order a gross of these, if they cannot find them at the hardware or shoe stores, for it is important that we should economize in these times, when for every dollar that we earn we only get a fraction of its worth in silver, and perhaps have to wait for that.

The Price of Skylight Work.

From R. B., *Ohio.*—I would like to know how skylight work is figured, and what New York firms charge per square foot, as I believe most of them figure by the square foot.

Answer.—The following figures are furnished us by a cornice maker in this city: Skylight work is figured by the square foot, the number of square feet being obtained by multiplying the width of the skylight by its length. For instance, a skylight measuring 5 feet 2 inches in width, by 6 feet in length, would contain 31 square feet. The prices charged per square foot for skylight work in New York differ according to the thickness of glass used, the construction and the workmanship. A flat pitched skylight without ventilator can be made in New York at 65 cents per square foot, for all sizes over 3 feet square, using No. 26 galvanized iron and ¼-inch thick ribbed glass. For flat skylights, 3 feet square and less, 80 cents per square foot. If a ventilator is required on the flat skylights an additional 5 cents per square foot should be added. For hipped skylights without ventilator, using No. 26 galvanized iron and ¼-inch thick ribbed glass, 75 cents per square foot is charged for all sizes over 3 feet square. For hipped skylights 3 feet square in size and less, 90 cents per square foot. If a ridge ventilator is required on the hipped skylight, an additional 5 cents per square foot should be added. When louvres from 20 to 24 inches in hight are required to be placed under the flat or hipped skylights, 60 cents per square foot is added to the foregoing prices.

These prices include finishing the skylights complete at the building and screwing fast to the frame, providing the job is within five miles' radius of the shop; if more than five miles from the shop the loss of time should be added. There are other skylights, known as "turret lights," the sides of which are glazed, and operated to open and close from below by means of worm gearing. The prices of these turret skylights vary from $1.50 to $3 per square foot, according to the number of sashes to be operated and the size of the skylight. The above prices are based according to rates of wages paid in New York—namely, $2.75 to $3 per day, eight hours constituting a day's work—and ¼-inch ribbed glass cut to fit, at 14 cents per square foot. This correspondent will readily understand that if the rates of wages paid in Ohio are higher or lower than in New York, and the hours of labor different, the price per square foot of skylight work would vary accordingly. The best plan to follow in obtaining rates per square foot of skylight work is, having a given size skylight to make, keep a tally of the amount of time and material required on same, and, knowing the rates of wages paid per day and the number of hours constituting a day's work, the rate per square foot can easily be obtained.

Trouble with a Well Cooler.

From P. R. F., *Virginia.*—For the benefit of the readers of *The Metal Worker*, and especially those who have suggested a change of the connections to the well cooler about which I wrote in *The Metal Worker* of July 1, I will give my experience with it. I have taken the boiler out of the well and extended the supply pipe to within about 2 inches of one end and extended the discharge pipe to within 2 inches of the other end, and put in a scattering plate on the end of the supply pipe. It now works to perfection.

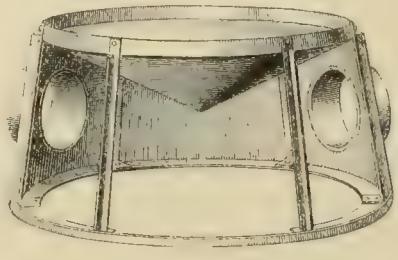
Heating Coil and Radiator.

From H., *East Orange, N. J.*—Will you please inform me through *The Metal Worker* how many square feet of radiating surface will be required to heat two rooms, one 19 x 15 feet, the other 11 x 11 feet, each with ceilings 9 feet high and having 30 and 40 square feet of glass respectively. The room 19 x 15 feet is a back parlor, connected by an opening, but no door, with a front parlor of same size, which contains a register. There is a door between the back parlor and the small room and the intention is to place a radiator in each room. How many square feet of heating surface must be put in a coil or generator to be placed in a hot-air furnace to supply hot water to the radiators for the rooms?

Answer.—So many of the conditions that should be taken into account in answering such a question are missing that a strictly accurate answer cannot be made. There are many rules in use for apportioning radiating surface, the majority of which take into delicate consideration every possible condition and are as cumbersome as they are safe and correct. These could not be used with the information at hand, consequently the rule used is that which requires from 30 to 50 cubic feet of space to be heated by each square foot of radiating surface. This requires judgment in application. If the building is of a character to retain heat and is surrounded by other buildings and the room in question exposes but one wall to the weather, the radiating surface might be safely required to heat the full limit, while if the reverse was the case the small limit might be taxed. Our correspondent must use his judgment in his application, but for example we will use 40 feet, and as there are 2565 cubic feet in the parlor it will require 64 square feet, and there being 1089 cubic feet in the small room it will require 27 square feet, making a total of 91 square feet of radiating surface required for the two rooms. In deciding the amount of surface that will be needed in the heating coil there are as many rules and variations in opinions as in apportioning radiating surface. If the coil is made of 1-inch pipe and is placed in the furnace just above the level of the fire, and where the products of combustion have full effect, the amount of radiating surface that each square foot of the coil will carry varies from 20 to 30 feet, according to different authorities. Some go higher yet, as a 1-inch coil is looked upon as an excellent heater when exposed above a large grate area, as we suppose it would be in this case. As the grate area is not known to us, we shall expect our correspondent to again use his judgment in determining this amount. In order to give an example, we will use 25 feet, which means each square foot of coil surface must heat 25 feet of radiating surface. As there are 91 feet of radiating surface, we find, by dividing it by 25, that there must be 3½ square feet in the coil, and as the piping will lose some heat, it might be well to put 4 square feet of surface in it, or about 12 lineal feet of 1-inch pipe.

Improved Furnace Top

From A. L. BURTIS, *Lockport, N. Y.*—I have been thinking that there is room for improvement in furnace tops, and would like to submit the inclosed



Improved Furnace Top.—Fig. 1.—General View of Top with Side Removed.

sketch, showing what might be done to the manufacturers of furnaces. The business of making furnace fittings by machinery is, in a short time, going to take the place of shop work to a large extent, which will, in my opinion, insure better work in the future than has been done in the past.

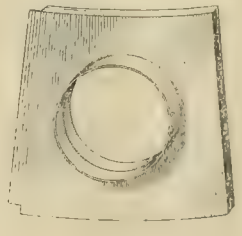


Fig. 2.—Collar Section.

As another step in advance, why could not the furnace top be made as shown in Fig. 1, making a light cast-iron frame, the top being connected to the ring by means of braces all bolted together? Sliding side sections, as shown in Fig. 2, could be made double with an air space, such sections having different sized collars nicely seamed in and provided with dampers. Other sections could be made plain, as shown in Fig. 3, which could be taken to the job if necessary, and collars fitted in as might be required. The cone top would afford ample space for filling with sand, cement or mineral wool, and its shape is such as to deflect the heated air to the various outlets. If desired, a brace or support could extend from the point of cone to the top of furnace dome. The collars could be all put in one angle, the necessary changes in direction being made by means of elbows.

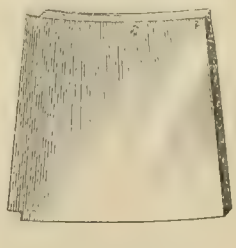

Fig. 3.—Blank Section.

American Tin Plates.

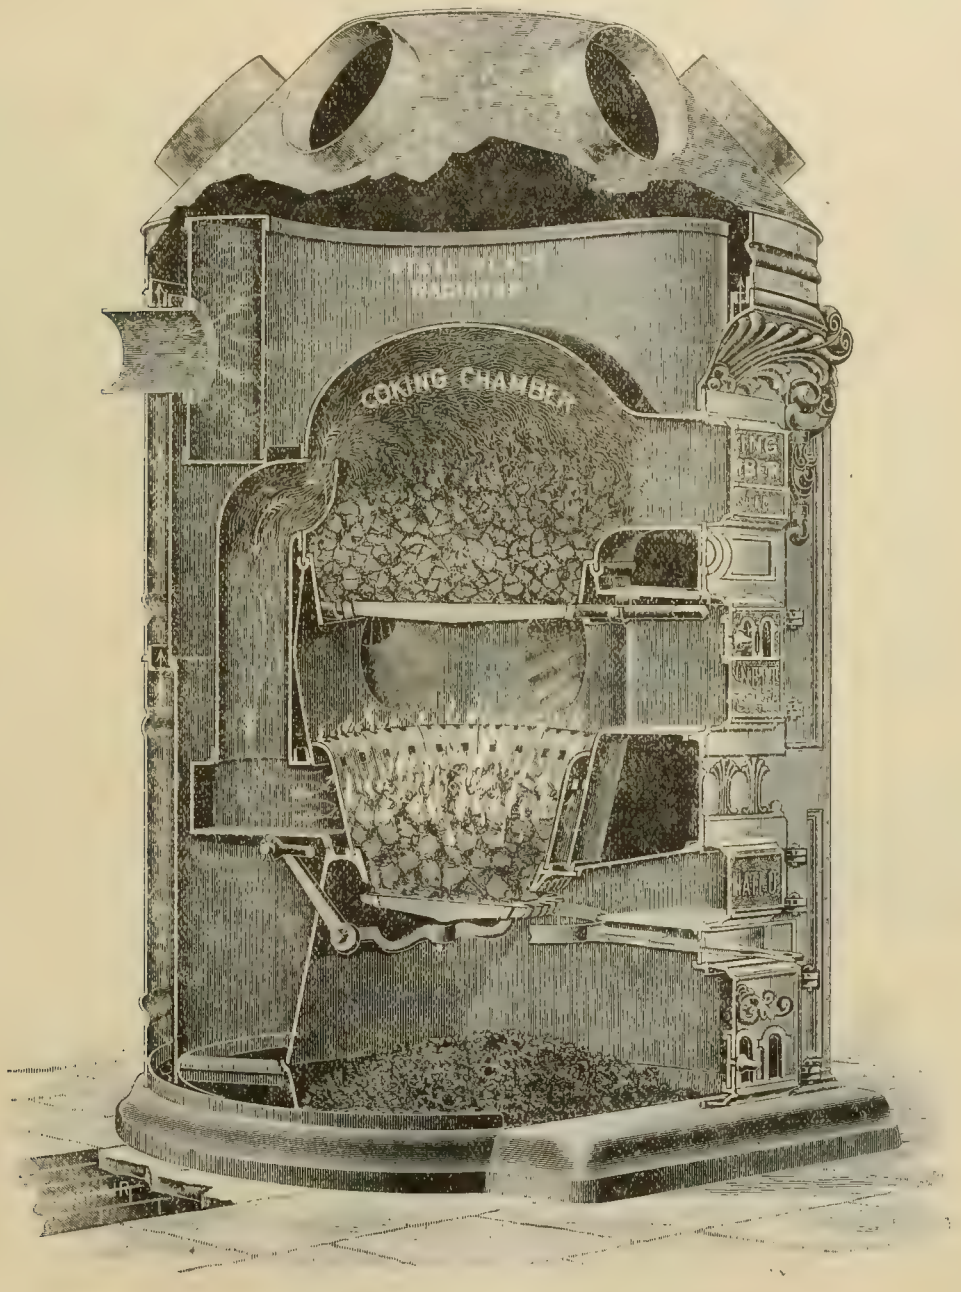
From B. B., *Montgomery, N. Y.*—Inclosed please find samples of IX American bright plates, cut from different sheets in the same box. Please examine them and note the defects. They are badly coated. We sorted the box over and found 35 sheets with a number of bad spots on them, like the samples, which were not fit to make tinware from. We paid a high price for the goods, and while the stock plate seems to be all right, the coating is not even, and in many places there is no coating at all. We like to get home-made goods, but we cannot afford to pay first-class prices for tin and not be able to use 35 sheets in a box, unless we happen to have furnace work to put it into. We hope all the American bright plates are not as bad as the box we have. We should like to hear from tinsmiths through *The Metal Worker* with regard to their experience. Please give it an item in your columns and let the manufacturers know that we must have good tin or we cannot use it.

Note.—We believe in presenting all sides of the question and not concealing anything bearing on the matter of American tin plates. The present letter is an exception, as the general experience with the American product appears to be highly in its favor. The samples inclosed by our correspondent on first inspection did make a very poor impression. The coating down in the corners and along the edges is undoubtedly rough, and at first glance there appeared to be many spots where the coating is entirely absent. Close inspection, however, with a magnifying glass reveals the fact that the principal defect in the plate is the roughness of the coating, and the black spots that at first look like the iron uncoated turned out to be spots of dirt and grease that had collected on the plate and that had been consolidated and hardened, presumably by the rubbing together of the sheets. One of the sheets appeared to be entirely free from uncoated spots, though the tin in the corner had a rough appearance that would unsuit it for bright ware. The other sample, which was apparently uncoated in many places, turned out to have but two uncovered spots where the original iron showed through and gave occasion for rust. The conclusion to be drawn, therefore, from the specimens of plate sent is that the finish is not what it should have been, but with the exception of the two places on one of the samples, where the tin had not taken hold, we did not notice any other radical defects. The result of oil and dust between the plates of tin gives, by rubbing, a very good imitation of a black spot, but it is well to distinguish between them and the actual uncoated portions of a plate.

The Bennett Gas-Consuming Furnace.

A heating and ventilating apparatus involving, it is claimed, a new departure in the use of soft coal as a fuel has been brought out by C. H. Bennett of Cincinnati, Ohio. The maker, however, does not claim that any radically new principles have been discovered, but that long experience and study have resulted in the production of a furnace which combines those principles best known to science, bringing them together in such a form as to produce the greatest economic results at a minimum of cost. It is well known that in using many of the heating furnaces as ordinarily constructed and intended for burning soft coal a large percentage of the heat is lost or wasted. The maker also refers to the fact, not generally known, that a lump of soft coal when placed on a hot fire does not begin to burn until the gas is first distilled or extracted from it, and then if the supply of oxygen is cut off the coal in its incandescent state becomes coke.

By referring to the sectional view of the furnace presented herewith, it will be seen that the heater consists of two principal parts, the upper one being designated as the coking and the lower one as the fire chamber. The soft coal which is employed as a fuel is fed into the lower chamber and the fire started in the usual manner. A similar amount of fuel is also fed into the upper chamber at the same time; the heat from the fire in the lower compartment produces in the coking chamber a perfect coal gas from the fuel there, which, being drawn downward through the gas flue shown at the rear, passes through the circular or square openings located at or near the upper edge of the fire pot, and passes over the live coals, where it becomes ignited. In this way the manufacturer states that all gases and carbon contained in the fuel located in the coking chamber are utilized, the by-product resulting being an excellent grade of coke. This, after the gases have been thoroughly extracted and used in the manner described, is deposited in the lower fire chamber by means of a reversible dumping grate, thus making room for a fresh supply of fuel in the coking chamber. This arrangement also enables the operator to keep the fire in the lower chamber at its greatest heating temperature, and owing to the manner of operating, provides a uniform degree of heat without the loss of time. This is a feature which it is claimed to be impossible to obtain in other forms of construction and one which, it is said, is most important and satisfactory to the user, as when the fire in the lower chamber is at its lowest point and producing a minimum of heat, the live coals in the coking chamber are giving out their greatest heat. Also, when the product of the coking chamber in the form of coke is deposited in the fire chamber below and fresh fuel added to the former, the latter is producing gas but no material heat, while the the replenishing of the fire in the lower chamber with the ignited coke causes it to throw out its maximum quantity of heat. Cold air is admitted to the radiating surface of the furnace and distributed in the usual manner. The maker states that all parts of the Bennett smokeless gas-consuming furnace are simple, easily understood and readily accessible for repairs when necessary. The fire-pot linings are made in sections and can be replaced or removed through the furnace door. All the parts which are most exposed to wear or heat are made extra heavy and all parts of the furnace are interchangeable, so that repairs can be made without delay.

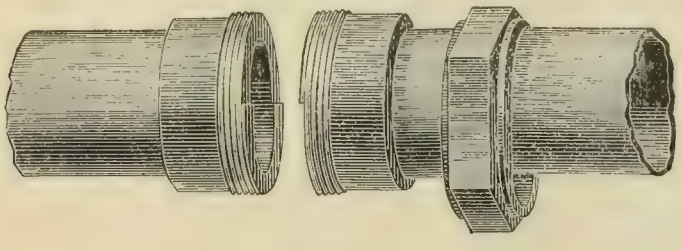


The Bennett Gas-Consuming Furnace.

PLUMBING and GAS FITTING.

Patent Pipe Coupling.

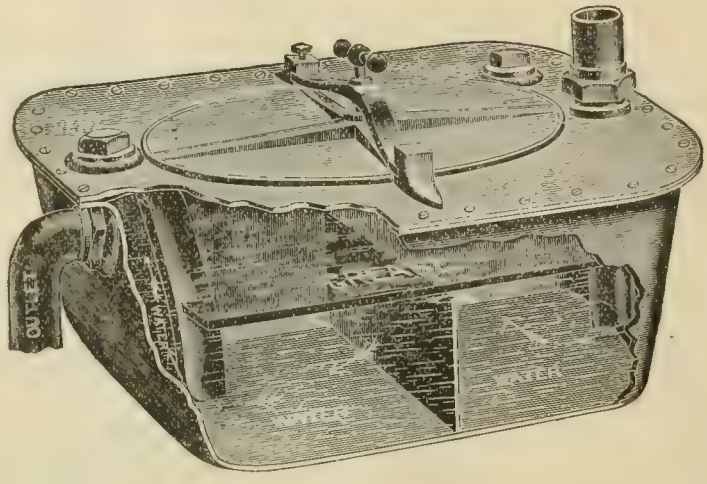
The John Simmons Company, 106–110 Centre street, New York, are putting on the market the patent pipe coupling shown in the illustration. It is simple in construction, consisting of three parts, two of which have a threaded recess at one end to receive the pipe and preserve a smooth waterway through the coupling. At the other end the faces are perfectly smooth to avoid the necessity of packing and are made with a step or offset to aid in their proper adjustment. The external surfaces of these parts are made with a slight taper and are threaded to receive the third part, a hexagonal nut threaded to suit the taper and which when screwed up forces the faces together, making a tight joint. An important feature is that no extra space is required to connect the coupling, as the parts are brought together by a lateral movement. This enables a new piece of pipe to be put in a system without the usual derangement of the whole, which can be appreciated in making repairs. The piping in the upper part of a building may be put in and the plastering and other work finished if this coupling is used for connecting the work put up later. The coupling is the invention of Alexander Bryant and was devised by him for Macdonald & Co., New York, for use in plumbing the Hotel Netherlands, so that it has been practically tested. It is made in six sizes for 2, 2½, 3, 4, 5 and 6 inch pipe.



Patent Pipe Coupling.

The Excelsior Grease and Sewer-Gas Trap.

The illustration shows the Excelsior grease and sewer-gas trap, made by Sproul & McGurrin, Grand Rapids, Mich. It is furnished either enameled or galvanized, and the size now on the market measures 12 x 18 x 10 inches deep. The inlet pipe connects at the top and the outlet pipe at the side of the trap, with a half-circle chamber, that runs down nearly to the bottom of the trap, at each end. Midway between the ends, running crosswise, is a partition that is half the hight of the trap. The greasy water is brought into the trap near the bottom, when it must rise and pass over the partition and down to the bottom of the outlet chamber before it can rise and pass off. This causes the grease to congeal and float on top of the water, and the trap filled with water prevents the escape of sewer gas. The top is bedded in cement to the sides and is provided with a hand hole which has a cover compressed in a rubber gasket, so that the trap is tight and yet is easily cleaned. An opening is provided for a local vent and also for the use of a vent pipe when desired.



The Excelsior Grease and Sewer-Gas Trap.

TRAPS AND VENTS.

PLUMBER W. D. Newton, Bennington, Vt., who sells gasoline, took a light into his cellar to draw some to accommodate a customer and by some being spilled a fire was started that did serious damage before it was stopped. Gasoline is an excellent servant, but exerts its power with disastrous effect when not handled according to certain inviolable rules. It should not be kept where the gas caused by a leak or spilling cannot be blown away and should be drawn at night only when the light is at a considerable distance.

A. J. FULLMER & Co., dealers in plumbers' supplies, 94 Federal street, Camden, N. J., had their safe opened by robbers recently, who secured about $100 for their trouble.

C. H. ROSE, manager of the Old Dominion Mfg. Company, Shendun, Va., is now in New York. This company manufacture such plumbers' goods as tanks, tank boards, water-closet seats, bath and wash tub rims, as well as all metal trimmings required in this line. He now has the business so organized that he will be able to spend a portion of his time in both places instead of being permanently at the works. He speaks encouragingly of the future, and says they have plenty of orders at the factories, which have not only been operated on full time and full force, but have been worked overtime some. Their trade is almost exclusively with jobbers and large dealers. At their New York warehouse, 242 Water Street, they have three lofts each 22 x 80 feet nearly full of goods, with which to promptly execute orders. They estimate in bulk this amounts to about 15 carloads of the larger size.

L. J. HANNIFY, a practical plumber, has been appointed the third member of the Waltham, Mass., Board of Plumbing Examiners, which will organize for business by September 10. W. N. Clifford is chairman of the board, and the other member is F. P. Johnson, the city engineer and an expert on sanitary matters.

THE OFFICERS of the Westfield Heating & Plumbing Company, a newly organized concern, are president, G. B Gaylord; secretary, E. B. Moore, and treasurer, F. C. Gaylord.

JOHN EMIG, manager of the Chicago branch of the Henry Huber Company of New York and Boston, has returned from a three weeks' trip East.

ONE of the leading English medical journals has been discussing the theory that the action of electricity on lead water pipes may induce sufficient impregnation of the water with lead to cause poisoning. Opinions are divided on this question, but the assertion that this may be the case is upheld by a number of scientific men, and the matter is worthy of attention.

A MOVEMENT is being made in Cincinnati to have all the plumbers examined and licenses granted to those who are entitled to them, the idea being to improve the work and prevent future trouble. A committee has been

appointed consisting of Mr. Sterritt, the Health Officer, Building Inspector Toker and Plumbing Inspector Wm. M. Roberts to confer with the Master Plumbers' Association to formulate a plan to accomplish this end.

IT IS WORTHY of commendation that the plumbers and gas fitters of Dallas, Texas, are going to do the work in the Buckner Orphans' Home free of cost. The cynic who looks on every one as seeking some personal gain in the grind of the business mill may cite this as an exception which proves the rule.

THE Examining and Supervising Board of Plumbers and Plumbing at Gloversville, N. Y., consists of Henry Sowle, chairman; T. F. Mullarkey, secretary; E. Brown Baker, treasurer, and F. E. Freeman, inspector of plumbing.

A PROTEST has been made by the Association of Master Plumbers of San Francisco to the Board of Health on the appointment of a new chief plumbing inspector on the ground of lack of qualification for the position. It is probable that the matter will be reconsidered at the next meeting on September 20.

ONE of the finest pieces of work turned out by the Glauber Brass Mfg. Company, Cleveland, Ohio, is the miniature Glauber patent stop and waste cock, handsomely gold plated, that adorns the watch chain of some of their friends as a souvenir. It is modestly stated that it is only an appropriate representative of the goods which the house claim to be of the highest grade.

A. J. DOTY, manager of the Harlem Gas Appliance Exchange, at 125 East 155th street, New York, who made a short call at this office last week, is an expert in gas consumption, whether for lighting, heating or cooking, and possesses a fund of information that is invaluable.

AT SALEM, MASS., the authorities are arranging to comply with the new plumbing law. The Board of Health will select an inspector of plumbing and a member of the Plumbers' Examining Board, who must be a practical plumber, to act with the building inspector and the chairman of the Board of Health, who form the Board of Examiners. These officials will be ready for duty September 10, and will have until December 10 to perfect a set of regulations to govern plumbing work. No one without a license can engage in plumbing work. A fee of $2 is charged for a master plumber's license and 50 cents for a journeyman's license, which will be granted to those who have passed the examination.

The A. Y. McDonald Company

of 168 Lake street, Chicago, and Dubuque, Iowa, have just brought out a very fine catalogue of brass and other goods for plumbers, steam and gas fitters, steam-engine builders, &c. The company have built up a very large trade since their advent in the line of plumbers' and gas and steam fitters' supplies, their most sanguine expectations having been more than realized. In order to properly care for the wants of their increasing trade they have been compelled to largely increase their facilities for the manufacture of brass goods and general supplies, and this handsome catalogue shows what they are now able to present. It consists of 368 pages of illustrated and descriptive matter, covering all styles of bibbs, cocks, faucets and stops, hose nozzles, lawn sprinklers, hose reels, iron bathtubs, sinks, urinals, iron washstands, cast-iron pipe and fittings, iron traps of all styles, hoppers, range boilers, marbled washbasins, earthenware urinals and closets, marble slabs for washstands, stationary washtubs, traps of standard makes, extension service boxes, champion air vents, improved automatic pumps or water elevators, pitcher and force pumps, railing fittings, malleable-iron fittings in great variety, cast-iron fittings, fittings for wrought-iron pipe, branch tees, valves of all patterns for all services, gauges, oil cups and other steam goods, a full line of tools, &c. The company's full line of pumps is shown in a separate catalogue.

Plumbers Failing in Examination.

From A. D. E., *New York*.—I have read the New York State law in regard to plumbing published in *The Metal Worker* September 2. I have a certificate of competency and a license under it. But suppose a plumber fails to pass the examinations, what then?

Note.—This is a legal rather than a trade question, and a legal opinion would probably be more acceptable than ours. The law seems to clearly state that certain requirements must be satisfied if a plumber is to carry on business, and usually when a plumber ignores or defies a law he has to pay the penalty that is inflicted by the court before which he is brought. This question has been discussed by many plumbers and the general opinion is that unless complaint is filed against the plumber who does small jobbing he will not be affected, but those who do larger work will be unable to get permits from the departments. Already this experience has been felt by some who have passed the examination, but failed to take out a license.

The Law Affecting Employing Plumbers.

From J. C. R., *Johnstown, N. Y.*—Does the new plumbing law require men to pass an examination who do plumbing as a branch of their business and hire men to do the work?

Note.—Article 2, section 4 of the new law seems to leave little doubt but all who desire to profit from plumbing work must satisfy the Board of Examiners that they are competent to do such work and then take out a license. The outcome of this provision in its bearing on many cases is being discussed with some interest, the opinion prevailing that it will require a test case to decide the question.

The *Manufacturers' Record* mentions a new use for palmetto leaves, which J. L Cutter of Fort Myers, Lee County, Fla., has converted into a pulp having all the essentials for being made into fine paper. He has had some of this pulp worked up by a manufacturing concern in Boston into pails, tubs, basins and other hollow ware, and it is said to be a great success for this purpose.

The proprietors of the Danville slate quarry, in Canada, are reported to be opening a market for their product among the Saxon school-slate manufacturers in Germany.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

AMONG the contracts for heating recently taken by the Illinois Heating Company, 88 Lake street, Chicago, can be mentioned the following residences in Chicago and vicinity: J. A. Sackley, 1268 Washington boulevard, hot-water heating; Wm. Nobles, 55 Florimond street, steam heating; Wm. Fitzpatrick, 425 South Leavit street, hot water heating; F. Leise, 19 Elaine place, hot-water heating; Fred. Berkholtz, Fifty-fourth street and Kimbark avenue, steam plant to be remodeled; E. R. Converse, Palatine, Ill., hot-water heating; W. H. Winslow, Oak Park, Ill., steam heating.

T. C. BOYD, 40 Dearborn street, Chicago, has the contract for the plumbing in the new Criminal Court building, corner of Michigan street and Dearborn avenue. The floors and wainscoting in toilet rooms will be of marble and all exposed work nickel plated. The Kelly syphon closets and wash basins are to be used.

JOHN W. MILLS, 100 Lake street, Chicago, has on hand three of the largest contracts for hot-water heating in Milwaukee that have been taken in the Northwest lately. Mention has previously been made of the contracts for heating the Sanitorium with 9000 feet of radiation, and St. Joseph's Convent with 11,000 feet. The latest contract is for heating St. Mary's School, for which two No. 25 Bolton boilers and 8000 feet of radiation will be required.

B. E. LEONARD of Scranton, Pa., has been awarded the contract for heating the new Government building now being completed in that city. The steam-heating plants in the Hillside Home, the Delaware, Lackawanna & Western Depot and the Moses Taylor Hospital, were installed by the successful bidder.

AUTHORITY has been given for the expenditure of $1800 to place steam-heating apparatus in the schools in Springfield, Mass.

BIDS will be received by the Supervising Architect, Washington, D. C., until September 14, for the plumbing and contingent work on the United States Court House, Post Office, &c., at Abingdon, Va. Drawings and specifications can be obtained from the Supervising Architect at Washington or from the Superintendent at Abingdon.

A NEW RESTAURANT to be opened in Boston, Mass., by Dennett, is being fitted out with a steam heating plant with a Mahony boiler by E. J. Brody of New York, who is also doing the plumbing.

JOHN INGRAM, Jr., East Stroudsburg, Pa., who represents Louis Waefelaer, 54 Beekman street, New York, has during July and August made the following sales: 21 Ingulf syphon closets for the Somerset hotel, Bernardsville, N. J.; 33 Ingulf syphon closets for the State Normal School, Stroudsburg, Pa.; 10 Ingulf syphon closets for private residences in Stroudsburg, and 26 Rival wash-out closets for the Forest Park Hotel, Bushkill, Pike County, Pa.

W. P. BENNETT, Macon, Ga., has completed an exceptionally fine plumbing job in the Brown House.

AN ORDER has passed the Manchester, N. H., Council authorizing the Lands and Building Committee to procure plans for heating the Ward IX Schoolhouse.

STEAM AND HOT WATER.

The Rex Hot-Water Heaters.

We present in the accompanying cuts illustrations of the Rex hot water heaters, the sectional view, Fig 1, showing the style of the series 313, 315 and 317, while Fig. 2 is a general view of the series 211, 213 and 215. These heaters

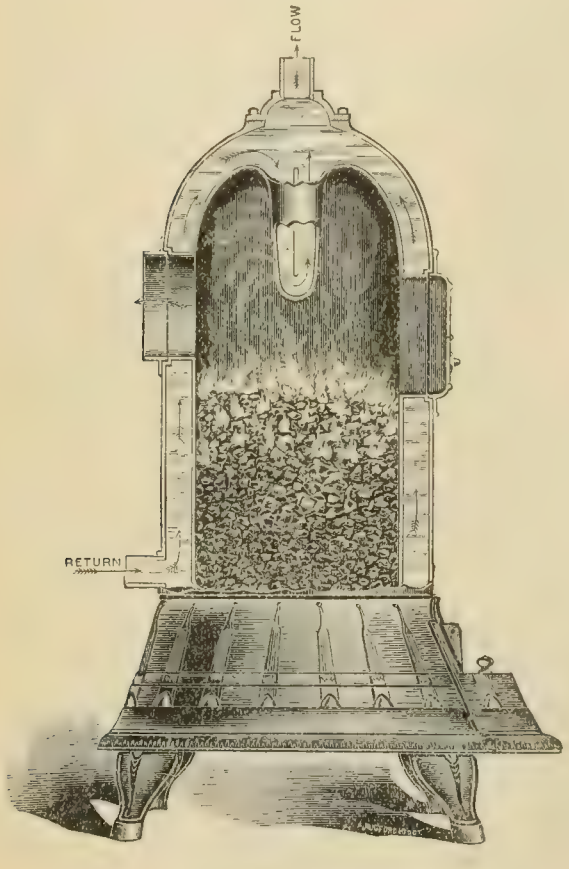


Fig. 1.—Sectional View of Series 313.

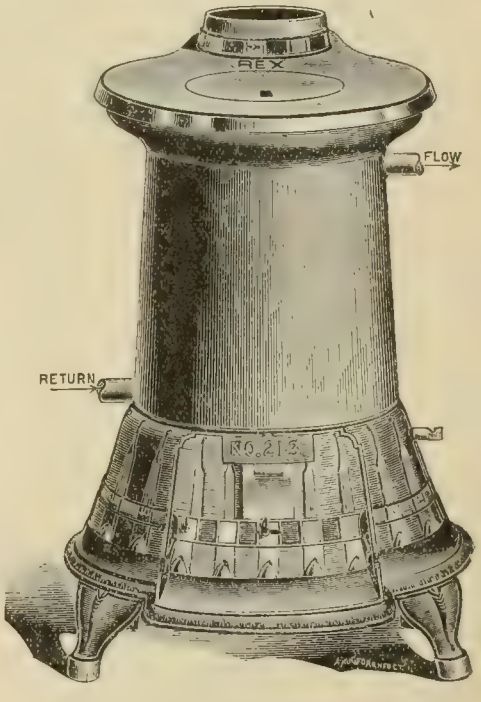

Fig. 2.—General View of Series 213.

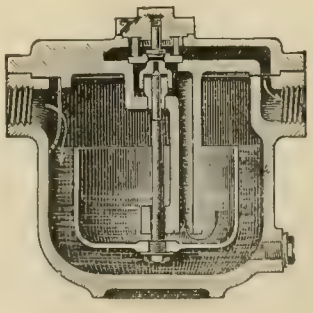
REX HOT-WATER HEATERS.

are put on the market by the Rex Heating Company, Norwich, Conn., and are intended specially for small dwellings, stores, offices, bathrooms, conservatories, poultry and brooder houses, stables, &c. They are fitted with anti-clinker grates, and the casting is in one piece, doing away with all joints. As shown in the sectional illustration, Fig. 1, a water chamber surrounds the fire pot and combustion chamber, while above the fire is a pendant portion with a diaphragm in it, as illustrated. The smaller heaters are made in three sizes, with a diameter of grate of 11, 13 and 15 inches. The larger sizes have diameter of grates of 13, 15 and 17 inches. The latter are adapted to heat from 150 to 300 square feet of radiating surface, or 175 to 350 gallons of water per hour.

THE WOONSOCKET ELECTRIC MACHINE & POWER COMPANY, Woonsocket, R. I., have decided to use steam for heating their new building, after having investigated the merits of electric heating systems, which were found to be desirable, but with the present devices cost was the objectionable feature.

The Acme Steam Trap.

This trap, made by Schaffer & Budenberg of 66 John street, New York, and 22 West Lake street, Chicago, discharges automatically the water of condensation without loss of steam, and also the air that may be contained in the pipes, so that no valve need be provided for that purpose. In this apparatus the open float carries a spindle which closes against a small outlet passage in the main outlet valve when the float is forced upward by the water which has collected in the trap. The main outlet valve is forced upward against its seating by the steam pressure in the hollow part of this valve,



The Acme Steam Trap.

and when the water in the trap overflows into the float and causes the latter to sink, the small valve is first opened, thereby allowing the steam in the cavity of the main valve to escape, so as to relieve it of pressure from below. The valve is consequently fully opened, allowing the water to escape freely until the float has again risen sufficiently to close the valve. The air in the trap is free to escape past the spindle and through the small passage in the main valve. This combination of a small valve and a large one gives the trap the advantage arising from large capacity when compared with others of the same size. All the movable parts of the trap can be easily taken out for examination or cleansing through the small opening in the cover of the trap without removing the entire cover, and the interior parts can all be taken to pieces without disconnecting the trap. It is unnecessary to provide the trap with a check valve in the delivery pipe in cases where the water is forced against a head.

Loss of Heat from Steam Pipes.

From an article in the *Sibley Journal of Engineering*, by Chas. Dunn and W. G. Mack, we reprint the following observations on the loss of heat from plain piping under varying air currents :

The object was to determine the heat losses and to obtain some law governing the heat losses from piping under varying air currents.

We tested two sizes of piping, a 2-inch and 1-inch, 16 feet 1½ inches long, at different steam pressures, with the air in the room as still as possible, in the same manner as the radiators were tested, and found the heat given out per square foot per degree difference between steam and air per hour in B. T. U. was as given in column four in the following tables:

Table No. 1.—Two-inch Piping.

Gauge pressure.	Absolute pressure.	Difference of temperature between steam and air.	B. T. U. given out.
5.50	19.72	155.64	3.307
13 65	27.87	167 10	3.745
27.60	41.76	194 49	4.337
47.05	61 26	213.23	4.518

Table No. 2.—One-Inch Pipe.

Gauge pressure.	Absolute pressure.	Difference in temperature between steam and air.	B. T. U. given out.
5.43	19.49	151.94	5.519
13.43	27.64	165 00	5 658
27.20	41.48	182.45	5.783

We next placed a 10-inch tin pipe around the 2-inch steam pipe. Several tests were made at different pressures, with three or four different velocities of air at each pressure, and the B. T. U. given out per hour per degree difference of temperature between steam and air per square foot are given in column four of the following table:

Table No. 3.—Two-inch Pipe with Blower.

Gauge pressure.	Absolute pressure.	Velocity of air. Feet per second.	B. T. U. given out.
4.45	18.63	9.87	6.322
5 09	19.28	8.57	6.370
5.38	19.62	4 396	4.292
5.86	20 05	4 283	4.716
5.27	19.47	6.92	5.458
5 15	19.35	5.57	5.458
12.48	26.67	6.47	5.533
13.70	27.63	6.15	5.194
12.10	26.03	5.78	5.241
12.25	26.18	5.62	5.189
13.73	27.71	3.674	4.528
13.55	27.53	3.319	4.989
25.36	39.46	7.64	5.666
27.10	41.21	7.34	5.909
27.54	41.65	6.29	5.364
28.21	42 32	6.23	5.411
27.10	41.22	3.901	4.196
26.70	40.82	3.567	4 611

By reference to tables of results Nos. 1 and 2, it will be seen that the heat given off per square foot from a 1 inch pipe is a great deal more than from a 2-inch pipe.

Somewhat of an idea can be obtained from these same tables as to what the loss of heat would be where steam is carried any distance through naked steam pipes in the interior of buildings.

From these tables it will be noted that as the steam pressure increases the difference of temperature between steam and air increases, and the number of B. T. U. given off per square foot increases; but it was found from our curves plotted in our theses that as the pressure became higher the heat given off increased in a decreasing ratio and approached a constant quantity at the higher pressures.

It will be seen, by reference to table of results No. 3 that the heat given off per square foot varies almost directly as the velocity of air passing over the pipe.

HEATING NOTES.

A FALL OPENING is what W. M. Mackay, manager of the steam and hot-water department of Hart & Crouse of Utica, N. Y., calls the completion of his office at 236 Water street, New York. Freshly painted in soft shades and with plenty of light, it impresses the visitor cheerfully and shows a No. 10 Royal hot-water boiler and a No. 19 Royal steam boiler to excellent advantage. Having now a pleasant office and sample room, invitation is extended for an inspection of the Royal goods.

THE AMERICAN BOILER COMPANY, Chicago, issue circulars relating to the various goods which they handle. These include the Butz pneumatic temperature regulator, the perfected Duplex automatic air valves, steel expansion tanks and wool felt sectional pipe covering.

ACCORDING to *Kuhlow's Trade Review* the technology of heating and ventilation is in an advanced state of development in Germany, and its achievements are of great variety. The condition of things is ascribed to the fact that for at least 20 years trained engineers have had such matters in hand. Scarcely a single large public building in Germany is now erected without a central system for heating and ventilation, and the number of dwellings and business houses provided with such arrangements is constantly increasing. The exportation of apparatus for heating and ventilation is also on the increase.

IN AN ITEM last week respecting the American Boiler Company, the wording was such as to give the impression that the American Boiler Company did regular contract work. This, however, conveys a wrong impression, as the company sell to steam fitters and have, we understand, absolutely refused to undertake any contract for heating or figure in any way in the risks of heating contracts, as they believe that the boiler business to be made satisfactory should be brought to that point where boilers are sold like other merchandise to steam fitters. Those who are familiar with the methods of the American Boiler Company will not be deceived by the mistake in the item.

THE AMERICAN RADIATOR COMPANY, 111–113 Lake street, Chicago, report an increased correspondence from various parts of Europe regarding the radiators of their manufacture. Two large orders for radiators have just been received from Germany and one from Scandinavia.

WE ARE INDEBTED to the Richardson & Morgan Company, 92 Beekman street, New York, for a pamphlet relating to their steam and hot-water heaters. Since their last catalogue was issued they have introduced many new features in apparatus of this sort, among the new goods being the Cyclone steam boiler, the Cyclone combination hot air and hot-water heating furnace, hot-water stoves, &c. The volume opens with general remarks on steam and hot-water systems of heating, followed by illustrations and descriptions and price-lists of their combination steam boilers. Then comes a notice of Richardson's new Cyclone low-pressure steam-heating boiler, general and sectional views being given. The Cyclone hot-air and hot-water combination furnace is similarly illustrated and described, and at the close attention is given to hot-water stoves of their manufacture. Several blank pages at the end of the book are left for memorandum purposes.

GEO. W. PLASTOW, heating and ventilating engineer, formerly connected with Richardson & Boynton Company's steam and hot-water department, has resigned his position with the American Boiler Company, to take a position with Johnson & Morris, the well-known heating and ventilating contractors.

IMMEDIATELY upon the assignment of F. W. Lamb & Co., prominent steam and hot-water fitters, at 258 and 260 Michigan street, Chicago, the firm called their creditors together and by practically unanimous consent the creditors gave an extension of 15 months to the firm. On the 30th ult. the assignment proceedings were dismissed and the firm resumed business.

THE ILLINOIS ROOFING & SUPPLY COMPANY, 203 Lake street, Chicago, are distributing illustrated circulars calling attention to their goods. One of them gives a fine view of the South Dakota State Building at the World's Fair, which is covered with Gilbertson's Old Method roofing tin, which is accompanied by testimonials and also by references to other brands of roofing tin sold by the company. Another circular shows a house covered with the Perfection lock-seam steel roofing and gives particulars concerning its merits and advantages. A third circular is in the form of a blotting pad, bearing an illustration of the South Dakota Building.

A NOTICE is given to the trade under date of August 31, that the partnership heretofore existing under the style of Burdick & Hewson, West Superior, Wis., is dissolved by mutual consent and the business will hereafter be carried on by A. C. Burdick.

Prize Competitions.

Prize Competition No. 27 (Reopened).

Local Associations of Merchants.

This competition closed July 8, but in view of the exceptionally few replies which have been received from the trade and the importance and practical nature of the subject, we have reopened it, and extend the time up to which responses will be accepted to September 16.

Some points in regard to the subject appeared in the announcement concerning the competition in our issue August 26, and will probably be of service to those who are intending to compete.

The committee to whom the papers in Competition No. 20 were referred have awarded the prizes as follows :

First prize to B. H. ROSE.
Second prize to C. O. F. YOUNGSTROM.
Third prize to C. L. CHALMERS.

The discovery of an oil well at Akron, Ohio, has caused much excitement and speculation in that vicinity.

TIN PLATES.

The Tin-Plate Ruling.

The following is the text of Secretary Carlisle's official letter to Special Agent Ayer, changing the policy of the Department in the computation of tin-plate production under the tariff act of 1893:

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
WASHINGTON, D. C., September 4, 1893.

COL. IRA AYER, Special Agent,
New York, N. Y.

SIR: By this mail will be returned to you the statements of tin-plate manufactures comprising the quarter ending March 31, 1893, which were transmitted by you to this Department in accordance with instructions.

You are informed that after careful consideration of the matter the Department has come to the conclusion that the word "produced," which appears in the second proviso of paragraph 143 of the tariff act of October 1, 1890, was intended by Congress to exclude from the computation of results all tin plates made from imported black plates.

While, for the sake of uniformity in the reports of the fiscal year 1893, you will construct your abstract and report of the last quarter's transactions upon the same assumption as regards black plates as has governed reports of the preceding quarters of the year, you are instructed to prepare an appendix showing the results of the year's domestic production of tin plate, excluding therefrom tin plates made from imported plates, as already explained. You will also report the facts relative to the manufacture of domestic black plates during the last fiscal year. This appendix is to form part of your annual statement of results.

Respectfully yours,
(Signed) JOHN G. CARLISLE,
Secretary U. S.

Secretary Carlisle, speaking of this action, says: "The only thing in it is that a former administration of this Department decided to include foreign plates tinned in the United States as domestic product for computation under the proviso of the act of 1890, and the Department has now reversed that decision, and only tinned black plates of home production will be included in the computation in the future under the limitation period of the present rate of duty. The report for the fiscal year ended June 30, 1893, will be made to comply with this decision." With this view it is proposed to print the report of the last two quarters, together with the required revisory appendix.

The production of tinned plate in the United States July 1, 1892, to March 31, 1893, on American sheets was 34,682 052 pounds, and the amount from imported plates was 39,290,282 pounds, or 73,972,334 pounds in all. The increase of the March over the preceding quarter is stated to be:

	Pounds.
On domestic plates	3,300,000
On imported plates	6,750,000

In the March quarter the production was 29,566,399 pounds, of which 40 per cent. was made from American black plates. The estimate for the June quarter is 35,000,000 pounds. This would give a product of over 100,000,000 pounds for the fiscal year.

A PRESS DISPATCH from Elwood, Ind., states that the works of the American Tin Plate Company at that place are to be at once doubled in manufacturing capacity, affording employment to 700 men.

SCRAP.

DUQUESNE TIN PLATE WORKS, Second avenue, Soho, Pittsburgh, with city office at 715 and 716 Lewis Block, that city, are now in operation and turning out 50 boxes of terne plates daily. The present capacity of the works is double that number, which output will be reached when the plant is put in full operation. The trimming machine in use is one of the Thomas and White pattern, and is said to work very satisfactorily. American rolled black plates are used exclusively, and the firm mention that they find them better to work than foreign plates, owing to the fact that they are not old, as they get them fresh from the mill, while imported plates very often produce a number of wasters on account of the condition in which they arrive after long transit from the other side. The plates at present made at the Duquesne Works are one brand of roofing ternes named Iron City, claimed equal to Worcester grade. The firm expect to manufacture coke plates later, for which they will adopt the name Duquesne. The officers of the Duquesne Tin Plate Works are C. Dreifus, president; J. Wildberg, vice president and manager; L. E. Block, treasurer; and E. Dreifus, secretary.

RECORD MFG. COMPANY, Cincinnati, Ohio, have recently put into service at their tin-plate works the new Record tin-plate cleaning and polishing machine, which they report as working admirably. All their brands of tin plates will be run through this machine. The company's tin-plate plant has been kept running right along in common with the other departments of their factory, and the firm are prepared to fill orders for any of their special productions, including tin plates.

THE CLOSING DOWN of the tin-plate works has thrown more than 7000 men out of employment in South Wales. As the Welsh colliers are, however, reported to be giving up their fight for increased wages and resuming work, the main reason for stoppage—namely, the difficulty of obtaining coal—is in a fair way toward removal, and a resumption of operations in most of the tin-plate works may be expected to follow before long.

WALLACE, BANFIELD & CO., Limited, manufacturers of tin and terne plate, with works at Irondale, Ohio, advise us that they have been running part of their plant for the past three weeks, and during last week it was running to full capacity. Unless additional orders are received, however, it will be necessary to close down again in a short time.

THE Chicago Tin Plate Company have just completed a tin-plate plant at Wentworth avenue and Fortieth street, Chicago, turning out their first product on the 30th ult. They propose to develop their producing capacity to 1000 boxes per week. They purchase the black plates, but intend to add rolling mills in the course of time to make their own plates. The officers of the company are J. E. Jones, president, and W. D. Lewis, vice president. The product of the works is sold by George Nash, 210 Lake street, Chicago.

THE ST LOUIS STAMPING COMPANY'S WORKS, which were started into operation last week, give re-employment to about 1500 workpeople in the city of St. Louis, and the relief has been much appreciated. George W. Neidringhaus, treasurer of the concern, expressed himself on the situation as follows, in an interview recorded in the St. Louis *Republic*: "We have resumed operations after eight weeks of idleness. I do not think we have made a mistake in doing so. We have afforded employment to 1500 people and given them a chance to earn money wherewith to get the necessaries of life. But that is not what I mean when I speak of making no mistake. I mean in a business sense. The situation seems to have improved greatly, and the daily reports from our country customers are very encouraging. The heavy dealers have been living on their stock, and we cannot expect orders from them just now. We have several of our traveling men out on the road now and they are securing numerous orders from small dealers. In fact, the orders are increasing every day. This certainly would indicate that a feeling of confidence is growing, not only in St. Louis, but throughout the country. We were not the first concern to resume business and I am confident that we will not be the last. I understand that the Buck's Stove & Range Company will begin operations during the coming week and this will give employment to 400 or more men. I feel certain that the idle men in the city will soon be given employment in all branches of trade and business. The situation certainly seems to warrant it."

THE CUMBERLAND STEEL AND TIN PLATE WORKS, Cumberland, Md., which have been closed down for three months, resumed work on Thursday with sufficient orders on hand to keep them busy all winter.

A substance known as argentine has been introduced in Germany for making the so-called silver paper which is used instead of tin foil as a packing material. It is a finely divided form of metallic tin, also known as tin dust, is perfectly uniform in grain, of a bright metallic gray tint, and entirely free from crystalline particles. The raw materials for this substance are tin, hydrochloric acid and zinc. The material is made to adhere to ordinary white paper by the use of wax solutions, prepared by secret methods.

The following figures give the length of some of the longest bridges in the world: Tay Bridge, Scotland, 10,700 feet; Victoria, Montreal, 9500; Moerdyk, Holland, 8530; Forth, Scotland, 8300; Poughkeepsie, United States, 7100; Solway, Scotland, 5820; and Cincinnati, United States, 5300 feet.

THE RETAIL STORE.

Acme Well Bucket and Bottom.

Jackes-Evans Mfg. Company, 100-102 South Commercial street, St. Louis, Mo., are introducing bored well-bucket bottoms, in connection with buckets, as illustrated herewith. The bottom consists, as shown in Fig. 1, of wood, in the center of which is a circular hole. The valve is of wood, under which is a piece of leather to which is attached a galvanized iron loop. The valve is prevented from rising more than 1½ inches from the bottom by a straight galvanized piece, fastened to the bottom and passing between the legs of the loop. To renew the leather only two screws have to be removed, making the operation an easy one. The bucket, Fig. 2, is made of one piece of galvanized iron, resulting, it is stated, in a strong and serviceable bucket. These

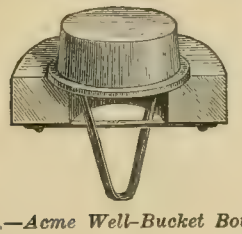


Fig. 1.—Acme Well-Bucket Bottom.

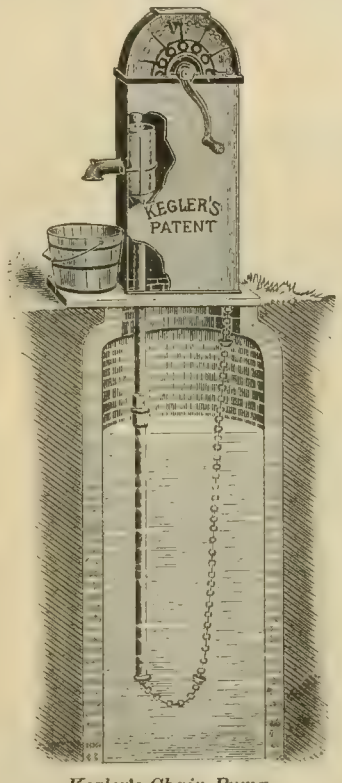
Fig. 2.—Acme Bored Well Bucket.

are made in 3½, 4, 4½, 5, 5½ and 6 inch sizes, each size gauged to hold a pail of water.

Kegler's Chain Pump.

The accompanying illustration represents the above article as put on the market by the Bellevue Pump Company, Bellevue, Iowa. The manufacturers claim that the pump curb, which is all iron, galvanized, has a top or cap, so arranged as to prevent the spattering of the wheel getting outside, or rain water getting inside; that the noiseless fixtures are fastened on the upper rim of the curb by small bolts, which when worn can easily be replaced by new ones; that the curb will not rust, rot nor accumulate filth; that it weighs 10 pounds less than the ordinary wood curb; that it is narrow at the top and wide below to prevent ice accumulating, and that the curb is not easily dented, as the sheet iron is tightly stretched.

The galvanized-iron tubing has a reservoir 3½ inches in diameter at the



Kegler's Chain Pump.

top to prevent waste of water, and the upper section of the pipe is made on a taper to allow a space between the bucket and the inside of the tubing below the frost line, to render it anti-freezing. The tube is connected by couplings with a leather washer to make it water tight and easy to couple. The claims are made that the tubing weighs ½ pound to the foot, and does not become saturated with water; that it is easily taken out and replaced when the cistern is to be cleaned; that it lasts longer than wood tubing and that under porches and under low roofing short pieces connected with couplings may be used.

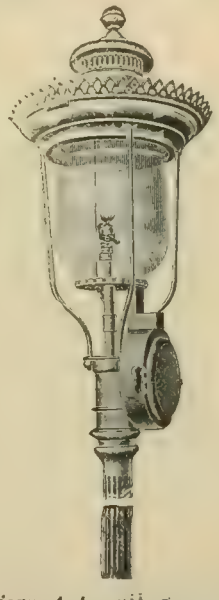
Gray Fruit Picker.

The Cleveland Novelty Company, Cleveland, Ohio, and the Ross & Fuller Association, 33 Chambers street, New York, are introducing the above article, as illustrated herewith. The handle is of hardwood, with a galvanized frame and canvas pocket; the length over all being 11 feet 2 inches. The manufacturers state that with it fruit can be picked in a circle of 26 feet in diameter, without bruising; that the picker is light, inexpensive and a great saver of labor. It is designed for picking oranges, apples, peaches, pears, apricots, plums, &c.

Gray Fruit Picker.

American Automatic Time Lighter.

The American time-lighting device, illustrated herewith, is being introduced by George H. Gregory, 35 Arch street, Boston. The lighter is described as consisting of an eight-day clock movement, inclosed in a box, the piston valve on the self-lighting gas burner



American Automatic Time Lighter.

being controlled by the mechanism in the box. The pilot flame system is employed in the arrangement, with specially designed appliances for protecting the flame from being extinguished. A feature of the device is the piston valve, situated inside the street lamp globe; the valve, it is stated, being selected on account of the evenness of its movement, and because of its being wholly unaffected by atmospheric changes. It is explained that the only attention the lighter requires is a weekly winding of the clock movement, and that it lights the lamp at the required time and extinguishes it at daybreak. The point is made that in this way many times its cost is saved by economy of gas, aside from the expense and trouble of lighting and extinguishing

the light daily by man or boy. The manufacturer claims that the machine can also be used for operating night lights in banks, offices, stores, &c., for controlling electric currents either for power or light, and for any purpose where a movement at any future time is desired.

Lavigne's Peerless Meat Tenderer.

The Lavigne & Scott Mfg. Company, New Haven, Conn., for whom the Frasse Company, 19 Warren street, New York, are agents, are introducing the above article, as illustrated herewith. The

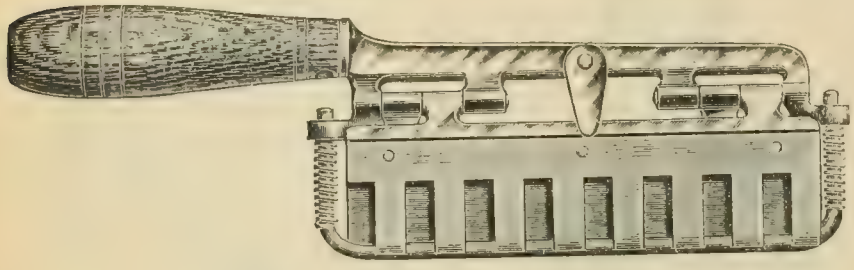


Fig. 1.—Lavigne's Peerless Meat Tenderer.

tenderer consists of toothed blades hinged to a handle frame, the blades being held in place by pieces pivoted to the frame. Between the blades is a heavy wire, with springs at each end, so arranged as to allow the wire to give when a blow is struck. The teeth of one blade are opposite the opening of the other blade, this arrangement being referred to as an advantage in operation. The shank runs through the wood handle and is secured at the end by a nut. By turning the pivoted pieces the blades can be opened for cleaning, as in Fig. 2. The manufacturers claim

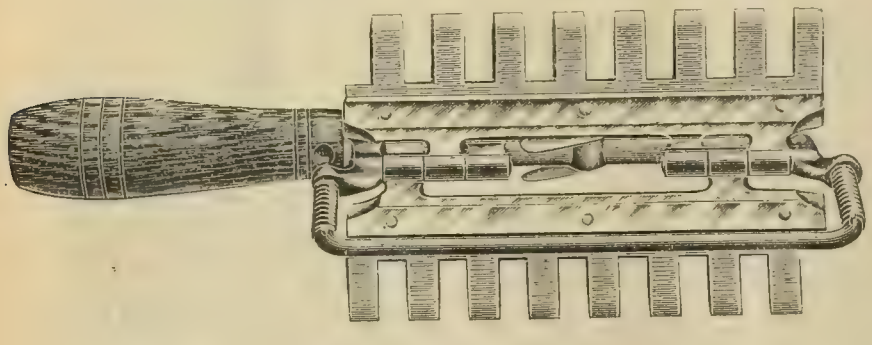

Fig. 2.—Meat Tenderer Open.

that the tenderer is made of the best stock, in the strongest possible manner, and owing to its simplicity cannot get out of order. They are made with bright blades, bright wire and japanned frame, also full nickeled.

Safe Business.

BY T. W. F.

Suppose that three Hardware merchants are doing business with the same amount of capital, under the same expenses, but with different results. A, with a capital of $2500, turns his capital three times during the year, resulting in sales of $7500; with expenses amounting to $1132.50. The expenses may consist of rent, clerk hire, freight, cartage, advertising, light, fuel, insurance, interest on capital at 6 per cent., postage, taxes and sundries, not including bad debts. The goods have been marked to yield a gross profit of 30 per cent., or $2250. After deducting the expenses from the gross profits, $1117.50 remains for personal expenses and clear gain. The ratio of expense to the sales in this case is a fraction over 15 per cent. B, with the same amount of capital also marks his goods to yield a gross profit of 30 per cent., but the capital is turned but two and a half times during the year, resulting in sales of $6250. Deducting $1132.50 for expenses, from $1875, which represents the gross profits, $742.50 remains for personal expenses. The ratio of expense to the sales is here a fraction over 18 per cent.

C, with the same amount of capital, expenses and goods yielding the same percentage of gross profits, turns his capital but twice, showing $5000 as his year's sales. His gross profits are $1500, leaving, after deducting expenses, $367.50 for personal expenses. Here the ratio of expense to the sales is a fraction over 22 per cent. A shows a satisfactory business; B, a business that might be considered satisfactory for a poor year; but C is running his business at a loss, as the average family cannot live on $367.50 a year, and the capital would have to be drawn upon to make up the difference. It will be seen that the percentage of expenses increases as the sales diminish, and that 30 per cent. profit is a fair average at which to mark goods. A business should increase from year to year, and as it increases the expenses may be increased by adding more or better help, better appliances for doing business, &c.; but the expenses should be kept down so as to bear the same ratio to the sales as formerly. In B's business the limits have been reached, both in the amount of expenses and smallness of sales; and to live anything but a hand-to-mouth existence the sales must be increased or the expenses reduced.

The interest on the capital would be a fair amount of increase in capital for the coming year, which a growing business will demand. It is desirable to invest the net gains in some other way than by returning it to the business as increased capital year by year; for should adversity overtake the merchant, outside means would be needed to help him out of trouble or to allow him to gain a new start in life.

STOVE TRADE NOTES.

The Western Stove Trade.

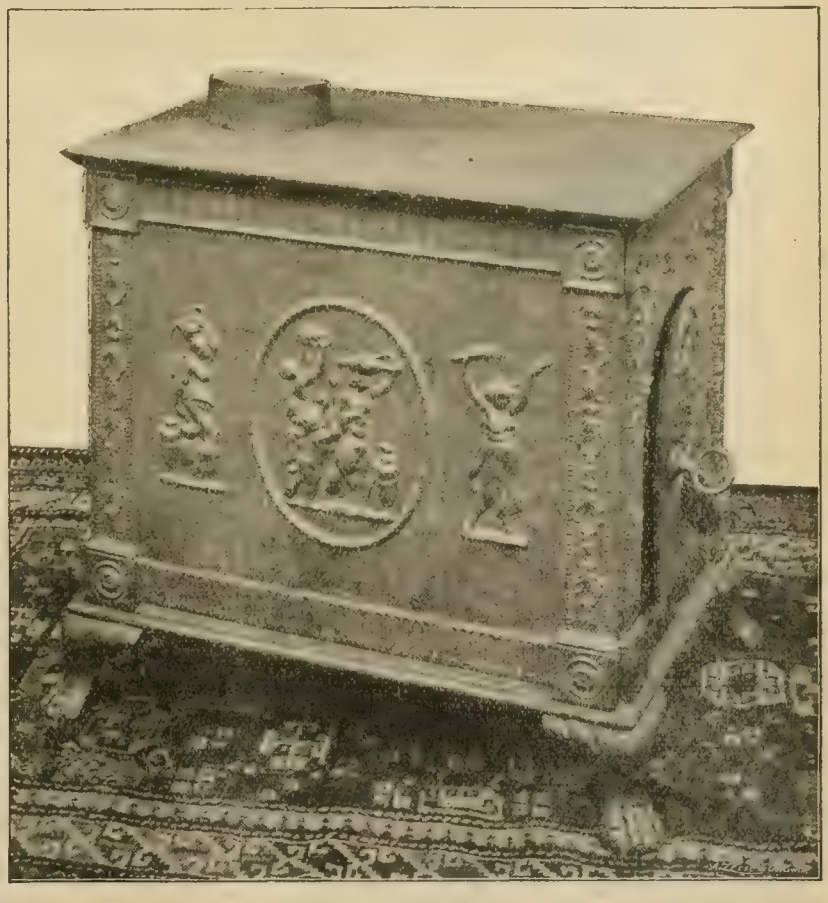
Within the past week or two a distinct revival of business has taken place in the Western stove trade. Up to that time there was but little evidence that this year's fall trade would amount to anything worth considering. Here and there a stove manufacturer reported a continued influx of orders, but such cases were so exceptional that they emphasized the general condition of inactivity. Probably the most of the large makers would have been able to do considerably more than they did if the financial outlook had not been so threatening and consequently the curtailment of credit was deemed wise. The best class of buyers did their own curtailing. During July and August many of them countermanded such orders as they had placed for fall shipment, leaving manufacturers in a state of complete uncertainty as to whether any part of the order would be wanted.

The poor prospects and the scarcity of currency caused stove foundries to be shut down in all parts of the country, as well as in the West. It is estimated by officers of the National Association that fully three-fourths of the stove manufacturing capacity of the country was idle in August. Many foundries were closed for two months. It is estimated that for 50 days the daily output was reduced at least 10,000 stoves. This is a falling off of 500,000 stoves at a time of the year when the foundries are usually very busy preparing for the fall trade. The supply is, therefore, short by that many stoves, and this shortage cannot be made up, although the foundries are rapidly resuming work as the prospect improves. During the past week many orders from the West and Northwest once countermanded have been renewed in part, with some chance that later in the month the balance of the order may be called for. This is due to the good condition of the crops. With the exception of a very few localities, the reports in this respect are excellent. If the wheat crop was short the corn crop will be heavy, or other grains have yielded well to make up the wheat deficit. As farmers get easy financially those who depend on farmers' patronage are benefited.

The only localities which have thus far shown no improvement in the demand are the so-called silver States. The prostration of their mining interests has absolutely cut off all trade, and a revival is not expected this season. Good orders had been entered by large stove manufacturers from buyers in Colorado, Utah, Montana and Idaho, which were countermanded *in toto* in the latter part of July, since which time nothing has been heard from them. The silver State trade is regarded as almost hopelessly lost for 1893, but the loss of this year is expected to be retrieved in the future, when silver is put on a better basis throughout the world.

Manufacturers anticipate a much larger proportion of mail orders this year than usual, owing to the unprecedented interruption to their business in entering advance orders and making early shipments. Even with a reduced volume of business as compared with other years, they are likely to find their facilities severely taxed on account of the curtailment of production in July and August. It will not be surprising if the merchants who defer buying until the last minute find considerable delay in getting their orders filled. This has already happened in the sugar trade, where precisely the same influences were in operation, curtailing business and production. Warehouses are not crowded with great stocks of stoves, as they have been when times were good.

Manufacturers are expressing satisfaction that this great depression in trade did not catch them in a period of inflated values. Their prices were so low that there was no room for any material reduction. There is no shrinkage in the value of their stocks of stoves to be looked for, as in previous times of panic. With the brakes released from the wheels of business everything can go on as before with no interference from such a disturbing influence as a sharp down grade in prices.



An Old Stove.

An Old Stove.

The accompanying illustration is a photo-engraving made of the central feature of the exhibit of the Michigan Stove Company at the World's Fair in Chicago. This they describe as the oldest stove in America and a legend on a framed placard put over it in the exhibit states that the stove was brought from France and placed in the first-established convent in Quebec in 1693. Down in the corner of the placard is the statement "by the courtesy of Mr. Charles F. Gunther."

New Plant of the Scranton Stove Works.

Some weeks since we called attention in these columns to the fact that the Scranton Stove Works had commenced operations in their new plant at Dunmore, Pa., and that all departments would be under full headway in a comparatively short time. We now learn that the plant is running in good shape with the old force all at work and that the company are fully installed in their new quarters. As showing the relative position of the various buildings composing the plant, we present the accompanying diagram, which also indicates the location of the cupola, cinder mills, elevators, stairway, &c. The foundry or casting room measures 196 x 195 feet in size and has the cupola so situated as to be readily accessible from all parts of the room. There is a capacity for 130 men in this department, which is largely in excess of that of the foundry of the old works. The stockyard is just outside this building, close to the cupola, and small cars for carrying the stock are run on the elevator and taken to the cupola, where it is weighed. Next to the foundry is the cleaning shop, measuring 70 x 70 feet. Beyond this is the mounting room, 145 x 200 feet in size, light to which is furnished by means of a monitor 35 x 80 feet in size. In the rear of the mounting shop are the boiler and engine rooms, where are located two 80 horse-power boilers and a 120 horse-power engine. In front of the foundry and cleaning shop are two buildings, one being known as the pattern shop and the other devoted to the storage of patterns. Directly in front of the mounting shop and separated from it by a driveway is a three-story building containing the offices and shipping room. A ground plan of this building is also presented in this connection. This structure measures about 41 x 98 feet and has a shipping platform outside so that goods may be carried directly from it to the cars, which are run up on a switch connecting with the Erie & Wyoming Valley Railroad. The basement of the building is used for storage purposes, while other portions are given up to shipping room, store room, advertising room and general and private offices. The company expect that when every detail is complete their plant will be among the best equipped and arranged in the country.

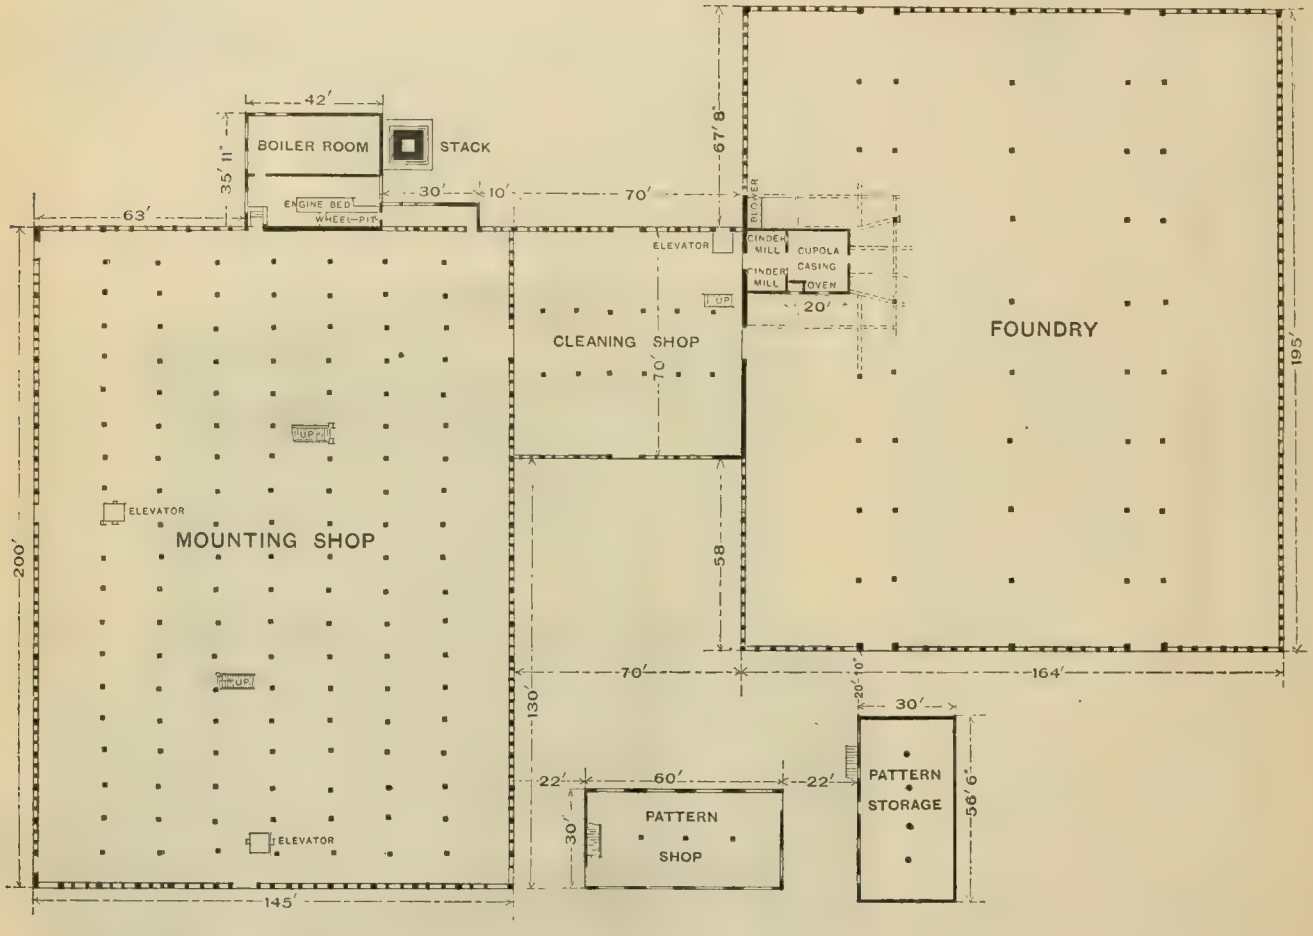


Diagram of New Plant of Scranton Stove Works, at Dunmore, Pa.

The Future of the Hot-Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

FURNACE FITTINGS.

For years the steam and hot-water contractor has been an assembler of parts. He has purchased his boiler, pipes, fittings and radiation, together with the necessary valves, gauges and sundries; taken them to the job to be done and installed them, but has performed no portion of the manufacture of the goods or apparatus. On the other hand, the furnace contractor has not alone put in the heating apparatus, but until a comparatively recent period he has produced a very considerable part of the equipment. Up to five years ago all piping, casings, dampers, register boxes, and the tin and sheet iron sundries pertaining to each hot-air job were made by the contractor in his own shop and on hand machinery, and this practice was undoubtedly a very serious obstacle to the progress of the furnace business, inasmuch as every furnace job requires an almost endless number of articles of various sizes, shapes and kinds, especially if the job is properly installed. The knowledge and skill necessary to make the patterns and produce these articles were such, however, as to deter many dealers from handling furnace work, who otherwise would have engaged in the business. But a change, and an important one, has occurred, and the furnace dealer now finds provided for him a line of furnace pipes and fittings, comprising everything needed in furnace work, and can obtain the same from stock as wanted at prices below the cost of hand work. This has been accomplished by means of machinery built for the purpose and which produces pipes and fittings in large quantities at a low cost for labor, and at the same time turning out goods uniform in size and quality. Over 1000 different sizes, shapes and kinds of these goods are made and carried in stock, ready for crating and shipment, and the railroads have made such classifications on these goods as to enable them to be shipped long distances from the points of production.

MACHINE MADE GOODS.

The advent of these machine made fittings has been the direct means of substituting in the furnace work of the

country a certainty for an uncertainty. In every case where hand work is carried on in the furnace business the dealer is at sea on costs. Periodically he times his men when at work on elbows, pipes or stacks, but in another month a different set of men may be in his shop who may be faster or slower than their predecessors, and more or less wasteful of stock, and calculations based on former figures must be revised again and again. Such figures are never reliable, as men are not like machines, and the same man varies in capacity from day to day. Of this I am certain, as I have kept records of the work of men on hand work for a period of weeks, and have been interested in noticing the wide difference in the daily outputs. In hardly one shop in 100 can a foreman tell his employer the cost of the various fittings entering into furnace work, or come within 10 per cent. of that cost. This is unfortunate, for the reason that a dealer knowing the exact cost of an article of his manufacture is in a position to figure intelligently and can undersell his competitor who does not know the exact cost, and must, therefore, figure at a larger margin in order to make himself safe.

Therefore the advent of machine-made fittings, by which the dealer can figure the absolute cost, is a step forward in the business and must have some effect on the future of the hot-air furnace. One of the effects of the general adoption of such fittings would be to place dealers on a parity with one another as regards that portion of their work, and would serve the purpose of concentrating the efforts of dealers on the furnace-setting branch of the business, which would lead to a higher degree of excellence in that department.

CAPACITY OF THE DEALER.

Another effect would be to double the capacity of the dealer during the busy season, as the time consumed in producing these goods by hand more than equals the time necessary for their installation. Furthermore, by having access to the right elbows, angles and bonnets, there is no necessity for poor work on the part of the dealer and no excuse for botch work, such as is too frequently seen in furnace work in small towns.

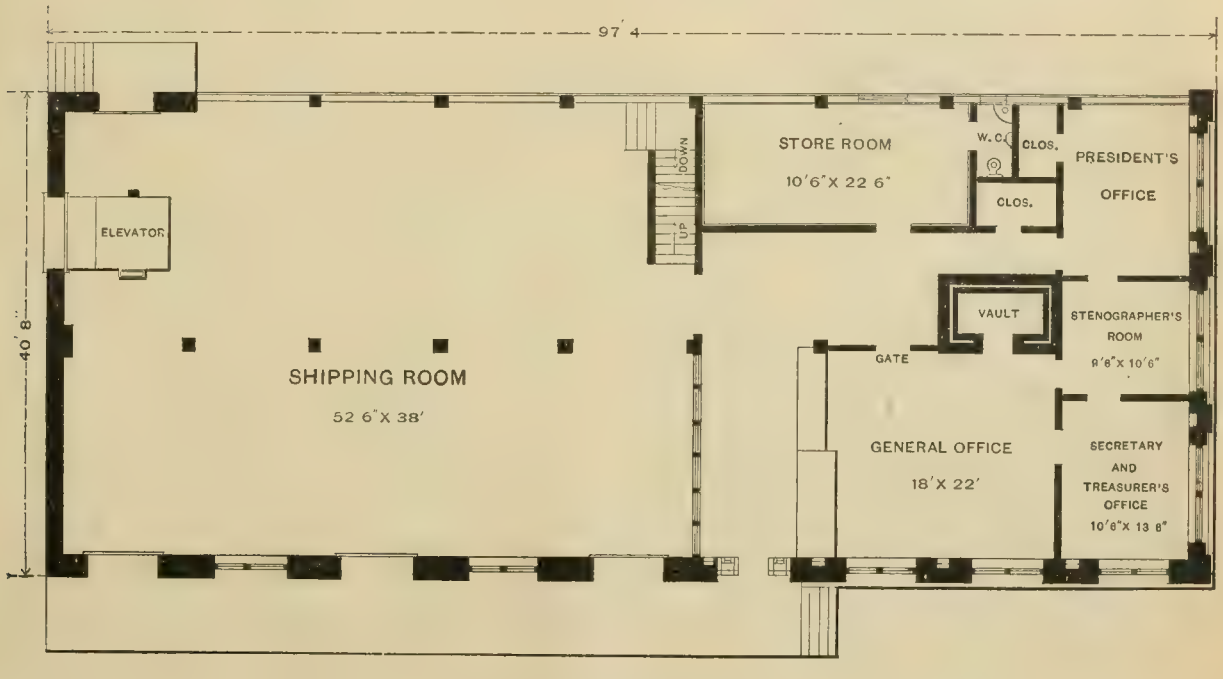
(To be continued.)

The O K Stove & Range Company.

We are indebted to the O K Stove & Range Company of 238 and 240 West Main street, Louisville, Ky., for a copy of their 1893–94 catalogue, illustrating the lines of O K goods. These include wrought-steel and cast-iron ranges, cook stoves and heaters, as well as hollow ware, tinware, granite iron ware, tinners' stock, tin plate, sheet iron, &c. The volume is embraced in 98 pages of letterpress, bound in colored paper covers of neat design. The opening pages are devoted to the Jewel wrought-steel range, made in several sizes and embodying the modern improvements. Following this we find the O K Standard range for coal or wood, and fitted with heavy covers and centers, large fire chamber, heavy coal linings, shaking and dumping grate, capacious ash pan, swing hearth plate and large oven. The O K Sterling, is a four-hole range made in the usual modifications and embodying the latest improvements. Under the name Reliable we find an interesting line of gas ranges, attractively decorated and offered in a number of sizes. In the way of cook stoves we find the O K Jewel, O K Royal, the O K Monarch and Nancy Hanks, all adapted for burning coal or wood, while under such names as O K Pride, O K Cook, the latter being a new construction, Improved Falls City, Golden Rule and Plantation are presented those for burning wood only. The heating stoves occupy the latter half of the catalogue, special attention being given to the new patterns which have been added this season. These include the O K Franklin with mantel top; the O K Oak having extra deep and heavy fire pot, shaking and draw center grate, large ash pan, &c.; the O K Franklin, with oval fire pot, heavy sheet steel back, cast-iron linings, swing hearth with drop down blower, and the O K Star, all of which are neatly decorated, and the company expect for them a large sale. The Imperial Jewel for 1893 occupies the place of honor and is a handsomely treated square parlor stove for hard coal. Under the name Peerless Jewel is offered a companion to the heater just referred to, while the Signet Herald, a self feeding base burner, is a member of the same class. We also notice a line of globe, cannon, laundry and box stoves, as well as price-lists of hollow ware, grates, elbows, &c.

J. P. Lindemann & Sons,

of 827 to 901 St. Paul avenue, Milwaueee, and 105 Lake street, Chicago, have issued an elaborate illustrated catalogue and price-list of the goods handled by them. The book is 6 x 9 inches in size, bound in fine cloth, with gilt side and back titles, and contains 248 pages. The first 162 pages of the contents are devoted to illustrations of the Red Cross line of ranges, cook stoves, heating stoves, hot-water boilers and hot-air furnaces manufactured by the Co-operative Foundry Company of Rochester, N. Y., for whom Lindemann & Sons are Northwestern agents. This line is complete in itself, comprising every style and quality of coal and wood cooking and heating apparatus. The special points of these goods are well brought out. Carton hot-air furnaces are next shown, followed by several pages of illustrations of standard furnace pipe fittings. Next comes the Imperial gas range, which contains many original features patented by the firm, which, they state, have been carefully and exhaustively tested under all possible conditions. The burner is especially referred to as a device of high merit in securing the economical transmission of heat, giving a specified result in cooking or boiling with greatest rapidity and least consumption of gas. Some 40 pages are then devoted to tinware and copper ware, in which the line is stated to be conspicuously



Plan of Offices and Shipping Room.

original in design, being made to a large extent with machinery of the firm's own manufacture. A new assortment is shown of extra heavy copper and IXXX wash boilers. Several pages are devoted to sheet-iron goods, such as stove drums, elbows, coal hods, stove pipe, pans, &c. Then follow miscellaneous goods, such as fire brick, dampers, mica, stove repairs, stove boards, &c. Eight pages are used for a line of gasoline goods, comprising the improved New Idea steel frame gasoline stove, the National Cabinet, high and low Juniors, street lamps, plumbers' and tinners' furnaces, &c. A full telegraphic code is given to facilitate ordering by wire.

John Van.

The death of John Van, which occurred at his home on Euclid avenue, Cincinnati, on September 1, removes from a long and useful career the inventor of the wrought-iron range, and one who labored among the earliest to perfect its usefulness and who contributed largely to its present excellence. His business talent and memory were both remarkable, and the latter contributed not a little to his success. For 20 years he resided at his native city, Montreal, Canada, when he left that country and spent several years in Troy, N. Y., before finally locating in Cincinnati more than a half century ago. Here he took a position with S. H. Burton, afterward Redway & Burton, the veteran manufacturer of stoves. Later he formed the John Van & Sons Company, and from this time the name "Van" and wrought-iron ranges became inseparable through the character of the goods put out by the house and the improvements made in the construction and conveniences which were continually added. Afterward the house became John Van & Co. by the admission of L. E. Zeigle, who in 1884 bought out Mr. Van, and the John Van Range Company was incorporated, which still bears the impress of his genius and still occupies a prominent position in the trade. At the age of 18 he married Miss Marguerite Doutey, who died in 1868, and he afterward married Mrs. Louise Boullet, who died in Paris in 1882. Six children survive him.

The Richardson & Morgan Company.

We have received from the Richardson & Morgan Company of 92 Beekman street, New York, a copy of a catalogue which they have recently issued to the trade showing their line of stoves, ranges, furnaces and combination heaters. It is a volume of nearly 130 pages of letterpress, printed in tinted ink and bound in colored paper covers. The side title is typographical in character, consisting of the name and address of the company with an indication of the line of goods manufactured. The raised letters are of white enamel and appear upon a ground work of deep blue. The goods presented are made under the name "Cyclone," and include a varied assortment. The first portion of the catalogue is given up to furnaces, embracing Richardson's Cyclone, made in portable form and also for brick work; the Tornado, with full revertible flue, tubular radiators, large ash pit and other features of obvious utility; Richardson's Cyclone combination hot-air and hot-water furnace, made in two sizes; Richardson's low-pressure steam heating boiler, patents covering which are now pending, and Richardson's combination steam boiler, together with a line of hot-water stoves for offices, stables, conservatories, greenhouses, &c. The ranges appear under such names as the Duplex, Puritan, New Reliable, Cyclone, New Pilgrim, Century, Diamond and New England, the latter being an elevated-oven range made expressly for private residences. A line of fire-place heaters is also shown, together with laundry stoves, tailors' stoves, &c. The closing pages of the volume are given up to tables showing capacity of hot-air pipes and registers, ground plan of brick work for furnaces, and sectional views showing method of connecting a furnace with cold-air supply from the outside. We also have from the company a 48-page catalogue devoted exclusively to the line of ranges manufactured, while a third catalogue is devoted exclusively to the company's assortment of furnaces.

ODD PLATES.

Townley Stove Company of Terre Haute, Ind., have just issued from the press their eighteenth annual catalogue of cook stoves and heaters, mantels, tiles, &c. The volume is neatly printed and arranged in a manner calculated to invite inspection. It comprises 44 pages, bound in colored paper covers. The first place is given to the Brilliant Eclipse range, made with four boiler holes and intended for burning coal or wood. It embodies the modern features and is decorated in an attractive style. Following this is the Solar Eclipse range, made for soft or hard coal or wood; after which we find the Superb Eclipse, a four-hole cook stove with the modern improvements; the Postal Eclipse, the Prairie Queen, the latter being for wood only; the Yucatan, Prairie City and Indianola. The catalogue also shows a line of vapor stoves which the company handle. The heaters include the Art Homestead, a neat square base heater for soft coal; the Buckeye Homestead, a member of the same class; the Sultan, the Erminie, the Total Eclipse and Royal Eclipse Franklin stoves, the Prairie Oak, the Star Eclipse, Favorite, Vandalia, Mikado and Branshaw, the latter a new box stove made in two sizes. There is also shown the Capitol hot-water heater, the Patric soft coal furnace and an interior view showing a mantel with cabinet and mirror.

The Isbell-Porter Company, 245 Broadway, New York, make a specialty of the machinery used in gas manufacturing plants, but the improved Mackenzie cupola and blower made by them still finds favor among the foundries.

Among the concerns recently incorporated at Albany is the Manhattan Gas Heating Company of New York City, to manufacture heaters for burning gas. The capital stock is $15,000 and the directors are John W. McClellan, Cecil C. Brown, Leonard W. Onion, William M. Reckless of New York City and Samuel J. Ametrano of Brooklyn.

The S. M. Howes Company of 40 and 46 Union street, Boston, Mass., have issued from the press a catalogue of stove, range and furnace repairs, together with a price-list of stove dealers' supplies. The volume is made up of 135 pages of letterpress, bound in colored paper covers, having an eye in the upper back corner for inserting a cord by which to suspend the volume within convenient reach. An interesting feature of the work is found in the opening pages, where are given directions for ordering repairs, a diagram representing a horizontal section of a stove or range fire box, the names of the several parts being designated, a price-list of stove and range linings, and illustrations of four varieties of grates, with directions for ordering. The repairs which can be furnished by the company are indicated by numbers which refer to the diagram of the fire box previously alluded to. The list of stoves is arranged in alphabetical order, after each name being given that of the manufacturer. This list covers something over 50 pages, following which is a price-list of hollow ware, sinks, registers and stove dealers' supplies. A comprehensive index completes the volume.

Among the recent passengers on the Jewel Tally-ho coach which is run by the Detroit Stove Works from their Chicago office to the World's Fair grounds may be mentioned the following: G. H. Schanck and Miss Schanck of Libertyville, Ill.; W. E. Stephens and Mr. McMurray of Honey Grove, Texas; Mr. and Mrs. Henry Kramer, Dayton, Ohio; J. W. Armstrong, South Auburn, Neb; Mr. Martin and Miss Martin, Ackley, Iowa; Mr. and Mrs. Isreal, Miss Gunderson, Miss Cost, J. H. Schlecter, Mr. and Mrs. A. Greenheid, G. Meisenhoelder, H. C. Ambler, Fred. H. Page, F. Sperry and Mr. and Mrs. Eldrege, all of Chicago; J. S. Johnson, Galesburg, Ill.; I. T. Peters and A. L. Bolin, Rockford, Ill.; Ben Robinson, Nevada, Mo.; Mr. and Mrs. H. B. Sahler, Atchison, Kan.; T. T. Sanwick, A. T. Sanwick and Ole C. Olson, Drayton, N. Dak.; Dr. H. H. Herbst and wife, Allentown, Pa.; Mrs. J. F. Schall, Batavia, Ill.; C. B. Halladey, I. S. Betts, Ben McLean, Sidney, Ohio; J. G. Chamberlain and friend, Hawkeye, Iowa; Mrs. J. H. Ford, W. B. Ford, F. C. Ford, Detroit, Mich., and Mr. and Mrs. J. White, Knox, Ind.

A new line of oil heating stoves, called the Plymouth, will be brought out in a few days by the Plymouth Foundry Company of 90 Union street, Boston, and Plymouth, Mass. The new stoves will have Rochester burners with 15-inch flame, and are expected to be very powerful heaters. They are compact in design, and highly ornamented, principally with nickel, weigh 17 pounds, stand 30 inches high, and have reservoir capacity of 1 gallon. They are to be introduced as high-grade stoves, at a moderate price. The Plymouth Foundry Company are running full capacity, turning out their regular line of ranges and parlor stoves. Their plant is situated on the water front, near the historic Plymouth Rock, and just now they are building a sea wall 430 feet in length and filling in, preparatory to erecting additional buildings.

Newton & Co., Albany, N. Y., are distributing a circular bearing an odd design relative to their Iron Stone stove linings. The durability of these goods is suggested by the design, which speaks more forcibly than words.

The North Dighton Co-Operative Stove Company of North Dighton, Mass., are distributing an exceedingly handsome poster designed for hanging up in the store of the dealer. The design is lithographed in bright colors and is entitled "Polly, Whistle." Across the top, printed in deep blue letters, are the names of some of the company's leading ranges, together with the statement that they are the best on

the market. The poster is bound with metal strips at the top and bottom and is arranged with an eye for suspending it upon the wall.

THE DIGHTON FURNACE COMPANY of Taunton, Mass., are the assignees of a patent granted a short time ago to E. A. Mason of that place for an oven door, designed for use in connection with cook stoves or ranges. The invention has reference to that class of stoves in which the doors swing vertically and are opened and closed by means of a kicker so arranged that the fall of the door is eased when the door is swung down or opened, while the rise of the door is aided when it is lifted or closed. The device patented by Mr. Mason is such as to render the operation of the door by means of the kicker more perfect, easy and noiseless without danger of the mechanism becoming inoperative or getting out of repair.

LOGAN P. KENNEDY of Louisville, Ky., has patented a kicker latch for stove or other doors, in which the arrangement of parts is such that the door can be opened by grasping the handle portion of the lever with the hand, then depressing it and pulling the door open. The interest of Mr. Kennedy in the patent has been assigned to the Lithgow Mfg. Company of Louisville, Ky.

"WHAT THE PEOPLE SAY who are Using Howard Heaters" is the suggestive title of a pamphlet of over 100 pages just issued by the Howard Furnace Company of Syracuse, N. Y. The matter contained within the terra-cotta colored paper covers is made up of testimonial letters from some of those who have used the company's goods. These letters come from all sections of the country and indicate in a striking manner the popularity of the Howard heaters. Many of these testimonials, we understand, were received by the company unsolicited, but for the purpose of reference they invited opinions from their customers through the medium of a circular letter, a copy of which is given in the opening pages of the pamphlet.

THE BUSINESS of Hart & Crouse of Utica, N. Y., has grown to such proportions that they find it necessary to increase their manufacturing facilities. To this end they have secured about 20 acres of land in East Utica, the plot having a frontage of 1050 feet on Turner street, and extending from the West Shore Railroad to the Erie Canal. From a local paper we learn that Architect Constable is now preparing plans for new buildings, work upon which will be commenced early in the spring. The foundry will have a capacity for 100 molders and will cover an area of 350 x 60 feet. There will also be a storehouse 300 x 50 feet, together with several other buildings. A switch will connect the works with the railroad, thus giving them excellent shipping facilities.

THE TUTTLE & BAILEY MFG COMPANY of New York and Boston have opened a large branch house at 136 Lake street, Chicago. Their salesroom is 160 x 20 feet, fitted up with shelving and racks from floor to ceiling, in which are kept full stocks of all the styles of registers manufactured by the company for heating and ventilating. In the front part of the store a large wall space has been reserved for the display of patterns of register faces. Here are shown numerous elaborate and ornamental designs in great variety of finishes. It is the intention of the company to carry as complete a stock in their new Chicago warehouse as they do in New York. Their trade in the West is now of such proportions as to make it almost necessary to have such a stock within easy reach of furnacemen. In addition to the salesroom they have an equally large basement well adapted for the storage of reserve stock. E. W. Ogden is manager of this branch.

THE BUCK'S STOVE & RANGE COMPANY, St. Louis, Mo., started their works on Thursday, after a stoppage of several weeks, with a force of 350 men.

THE MICHIGAN STOVE COMPANY are distributing whisk holders among their customers. They are made of tin, decorated in a design of shepherd's plaid, with the Garland trade-mark conspicuous on the front, and are pretty enough to be put up anywhere.

R. S. WOOD, secretary of Fuller & Warren Company, Troy, N. Y., gives as his experience that business continues to improve. Their works were shut down July 1 and started up the latter part of that month. For purposes of comparison, he says for the six months from January 1 to July 1, 1893, their business in amount was 53 per cent. in excess of that for the corresponding period of 1892, while during that time in 1892, at the Troy house alone they had exceeded the previous six months of 1891 (January to July) by over $100,000 in sales. They report an increased trade up to September 1 of this year, although somewhat less than they had anticipated earlier. He thinks there is going to be a satisfactory business. Regarding collections, he says they have been excessively close for some time past and are now. Still, there seems to be an easier feeling since the lower House of Congress took action on the silver question.

WE HAVE RECEIVED from the Detroit Council of Trades and Labor Unions a copy of the "Columbian Labor Day Souvenir and Program," compiled and issued under authority of that body. The pamphlet is made up of nearly 50 pages of letterpress and gives among other things the officers and standing committees of the association referred to; the officers of the Michigan Federation of Labor, together with numerous articles specially contributed for the Labor Day Souvenir touching questions of interest to those engaged in industrial pursuits. Some of the pages at the close are devoted to biographical sketches of prominent Detroit citizens, among the number being Hon H S Pingree, Mayor of the city; Hon. J. Logan Chipman and George H. Barbour.

Buck's Stove & Range Company

of St. Louis, Mo., favor us with a copy of a catalogue relating to the lines of stoves, ranges and heaters which they manufacture. The front cover is embellished with a *fac-simile* of the company's trade-mark printed in silver upon a slate colored background. Underneath the trade-mark is the inscription "The Peacemakers," which Buck's stoves and ranges are claimed to be in the homes of thousands of families. The warranty which the company give with their stoves is to the effect that they will "operate perfectly in the open air using four joints of pipe the same diameter as the pipe collar. Any stove that will work successfully under such conditions cannot fail to operate every time with the ordinary chimney." The opening pages are taken up with a statement of terms, a bird's-eye view of the company's works, showing the new Merchants' Bridge in the distance, a diagram of that portion of the city of St. Louis in which the works are located, showing how to reach them from different points, and an invitation to the trade to visit their establishment. Buck's steel range occupies the place of honor in the catalogue, and is a new line made in six sizes. The stove embodies the modern features and is adapted for hard or soft coal, coke or wood. Several varieties are shown in the volume before us. Following this construction we find a varied assortment of ranges, made under the name Buck's Brilliant and embodying the latest features of construction and decoration. Buck's Fashion range, A series, is a handsome stove made for burning wood only and is said to be built upon well-known principles which insure perfection in operation. Among the cook stoves we find Buck's Brilliant in large variety; Buck's Clipper; Buck's World; Buck's Eclipse and Southern Fame. The company state that Buck's stoves and ranges are so made that by removing a panel plate in the extreme back of the stove or range a square top can be readily converted into any kind of an extension top, or either style extension changed into a plain top. Other goods include Buck's Peerless, a neat high finish range for coal or wood; Buck's Brilliant cook stove, for coal or wood; Buck's Paragon, for soft coal or wood, and Buck's Flora, which has been improved by means of a new dress this season. Buck's Brilliant square base burner and ventilator is offered the trade this season, embracing all the features necessary to make it a powerful heater, while the decorative features are of such a character as to produce brilliant effects. Buck's Blazon is a medium-price base burner, which has been brought out for this season's trade, while Buck's Ideal, Buck's Famous, Buck's Guarantee and Buck's Oak are some of the other goods to which attention is invited. The last-mentioned has been improved for this season and is offered in a neat and attractive dress. Buck's Orion is a new open Franklin stove of rich ornamentation and embodying the modern features. Buck's Utopia is a new cottage parlor stove of handsome design and is made both return flue and direct draft. Buck's Autocrat, Buck's Windsor and Buck's Todd, all for burning wood, are shown, together with a varied assortment of box, cannon and laundry stoves. The catalogue closes with a list of hollow ware, miscellaneous goods and skeleton cuts of a cook stove and heater with the various parts numbered for use by the dealer in ordering repairs. The catalogue is neatly printed on good paper and is substantially bound in flexible covers, having side and back titles.

The East Chicago Foundry, Hammond, Ind., which has been closed for some time, resumed operations on September 6, with a large force of workmen. The prospects for steady running are said to be good.

Steps are being taken to increase the water supply in Paris to a sufficient extent to render the consumption of the foul water of the river Seine unnecessary. The waters of the Avel, a pure mountain stream, are being tapped for this purpose.

WORLD'S FAIR NOTES.

Armstrong Mfg. Company

of Bridgeport, Conn., make a comprehensive exhibit of pipe threading and cutting machinery at Column K 52, Machinery Hall. There are six power machines of various styles and sizes in operation, each having an adjustment with which they can be run by hand. They cut and thread from 1 to 6 inch pipe. The feature of these machines is the fact that the gears run in oil and are thoroughly covered up so as to exclude all cuttings, adding very considerably to the life of the machine. The die is made upon the principle of the company's hand die, with a double taper, and is readily ground on an ordinary grindstone. It is adjustable to difference in fittings by reason of a cam which carries forward the knives to the required position. The cutter is automatic, being fed into the pipe by a star feed. The pipe is held in position by four jaws carried forward on a pair of cog wheels which are adjusted on opposite sides of the pipe. These jaws are hardened and may be replaced at very small cost in case of an accident. The company also exhibit a line of their regular hand machines for threading pipe from ¼ inch up to 4 inches. The hinged pipe vise is a convenient tool in a fitting shop, being instantly opened and closed. Pipe wrenches are another specialty, also three-wheeled pipe cutters. Nipple holders are shown which are intended to hold nipples securely while threads are being cut, and to release the nipples easily without injury to the newly cut threads. The holder is a tube threaded internally at both ends, each holder being thus adapted to two sizes of nipples. A slot runs through the tube lengthwise, in which is a taper key holding a loose plug. The threaded end of a nipple is screwed into the holder until it comes in contact with the plug. The other end of the nipple is then threaded and the key is driven back, which enables the nipples to be withdrawn by hand instead of being ruined by the use of pincers.

The Deming Company

of Salem, Ohio, have two exhibits of pumps and other hydraulic appliances. One is located in Machinery Hall, at Column K, No. 33, and the other in Horticultural Hall, north end, Column U, No. 74. The Machinery Hall exhibit is very extensive and interesting. Occupying a very conspicuous position, the company have availed themselves of the opportunity to catch the attention of the moving crowds by having numerous specimens of their pumps in action. Among these are rotary and double-acting pumps, while hand pumps are invitingly placed so as to tempt passers-by to try them to see how easily they work and the size of the stream they throw. Some of the pumps are fitted with glass cylinders, so as to display the action of the valves. Among the specialties shown in actual use is the hydraulic pump, intended for elevating water by hydraulic pressure, as, for instance, in filling tanks on upper floors when the city pressure is too weak to carry up the flow. In general construction it is similar to a steam pump. Improved hydraulic rams are also shown, with one of them at work elevating water. In addition to an imposing array of all sorts of pumps arranged on the floor, a pyramid has been built with numerous steps for the display of more rows of pumps. At the top of the pyramid is a tank into which streams of water are constantly pouring from the pumps below. Prominent among the samples of pumps shown in the general display are the Keystone non-freezing, double-acting force pump, which throws a continuous stream and is made for hand use or for operating with a wind mill, and the Torrent two-cylinder tank force pump, which throws a barrel a minute and may be used to put out fires or to fill wagon tanks for threshermen and others. The company also show their Little Giant hydraulic pressure test pump with which to determine the pressure strength of boilers, pipes, pump cylinders, &c., having a capacity up to 800 pounds per square inch. The working parts are made entirely of bronze. The exhibit in Horticultural Hall consists of pumps for spraying and other special uses peculiar to gardening. Wm. L. Deming is in charge of the company's exhibits. General Western agents are Henion & Hubbell, 55 and 57 North Clinton street, Chicago.

George H. Eaton & Co.,

10 Mount Washington avenue, Boston, make a very creditable exhibit of power presses and shears for working sheet metal at Column I 48, Machinery Hall. These machines are not shown in operation for lack of space. They comprise No. 2, No. 3, Nos. 4 and 5, No. 7 and No. 29 power presses, which are selected as fairly typical of the machines built by the firm for this class of work, although their complete line is by no means covered. The No. 2 is a small press with a bed opening of 4 x 5 inches, the No. 7 has a bed opening of 9½ x 12 inches and the No. 29 is an embossing press. A No. 31 drawing press is shown, with a 6½-inch opening in the bed and a 3-inch plunger. The screw presses exhibited are No. 4, with a bed opening 6 x 8 inches, and No. 45, of somewhat larger capacity. The shears comprise a No. 3 hand, with a 6-inch blade to cut $\frac{3}{16}$ inch iron, a No. 40 slitting shears and a No. 39 geared power shears, which will cut $\frac{5}{16}$-inch iron. Attached to a neat display board are a large number of specimens of work done on the firm's presses, comprising iron, steel, brass and copper sheet metal, cut in a great variety of patterns, as well as finely embossed designs, shallow and deep stamping, &c.

Dr. Philipp Lenard of Bonn has recently shown the Prussian Academy of Sciences, Berlin, that the rays from the cathode of a Geissler tube, which are capable of causing phosphorescence, can pass through a thin plate of metal, such as a plate of hammered aluminum, $\frac{3}{2500}$ inch thick. The air outside a shutter of this material, although the shutter is quite opaque to ordinary rays of light, glows faintly, with a bluish halo, while the shutter itself appears as if it were somewhat luminous, and bodies capable of being excited to phosphorescence shine when held in proximity to the metal. Coal gas and hydrogen are said to show these results better than ordinary air.

A patent has recently been granted to Charles and August Lindemann, Milwaukee, Wis., for an improvement in the manufacture of sheet metal elbows, relating to that class of elbows made from a series of sections united by circumferential seams. Instead of seaming the sections one after another, the new process is designed to save time and labor by making it possible to assemble at one time all the sections in each elbow and close the seams by successive operations of the machine to which these assembled sections are fed.

The Perfection Drum.

The engraving which we present herewith shows the Perfection drum and represents the device with a portion of the outside shell broken away, indicating the construction of the air and smoke flues. The arrows show the points at which the cold air enters the pipes at the bottom and its discharge at the top. The products of combustion pass around the pipes and heating chamber which forms the central portion of the drum, thus utilizing to the fullest extent the heat generated. The device here shown is manufactured by I. B. Kinne & Son, 208 Nicollet avenue, Minneapolis, Minn., and is claimed to be self-cleaning, does not stop the draft of the stove, can be used with all kinds

The Perfection Drum.

of fuel, is compact, and will heat an upstairs room from the parlor or kitchen stove without additional expense. The tubes in the drum are six in number and measure 2⅜ inches in diameter. The cold air is taken through these into the central heating drum, and discharged at a high temperature through the six tubes of the size mentioned at the top. The device stands 36 inches high, including the legs upon which it is mounted. The 12-inch drum is said to have 2302 square inches of radiation, and the 15-inch drum 3076 square inches of radiation. When "knocked down" for shipping purposes a crate 12 inches square and 38 inches long will contain six of the 12-inch drums. The makers state that a common tinners' mallet and wrench are all the tools necessary for putting the drums together.

Kansas women who serve as police justices appear to deal with the tramp question with the Solomonic wisdom of an Eastern cadi. One tramp was recently sentenced to two baths a day for ten days and hard labor on the stone pile, with the order that he was to be fed if he worked and starved if he shirked.

TRADE REPORT.

The Iron Market.

The most encouraging development during the past week has been the easing of the money market. The premium on currency has virtually disappeared, and it is a fact that commercial paper does occasionally find a buyer. While this does not mean immediate relief to the industrial and mercantile community, it does prove that the turn has come.

Blast-furnace returns indicate the tremendous strain under which the Iron and Steel trades have been. Practically we have come down in three months from a full normal rate of production of 9,000,000 tons per annum to one half that quantity. When it is considered that a blast-furnace plant is not readily closed down as other works, being continuous in its operation, it is fair to assume that the output of our Steel Works and Rolling Mills has shrunken even more. It is this, probably, which accounts for the increase in the stock of Coke Iron, which has taken place chiefly in those sections where the manufactures of Iron and Steel are extensive.

Consumption is undoubtedly still light, but there are indications that it is recovering somewhat. Chicago records a good contract for agricultural implement material and notes a better outlook for architectural work. Philadelphia, too, expects to secure some work in that line, while in New York the Third Avenue Bridge, calling for about 4000 tons of material, will give employment to some hungry mill.

Pig Iron.—In the New York market the event of the week, devoid of any sensational features, however, has been the announcement of a reduction in price by the Thomas Iron Company of 50¢ ℔ ton on Foundry grades, making their tidewater price $14 50 for No. 1x, $13.50 for No. 2x and $12.75 for No. 2 Plain. In taking this action the company desire to protect their trade. As a matter of fact, they follow the market rather than lead it, and are still above the prices at which Iron satisfactory to many consumers has been sold for quite a long time. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2 at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $13 for No. 1 Soft.

The demand for Pig Iron in the Philadelphia district has not yet shown much improvement. Many of the leading consumers—foundrymen particularly—have done very little work since midsummer, consequently have had no necessity for replenishing stocks.

It is expected that things will start up quite lively in a little while, but for the present it is a fact that Pig metal can only be sold in small lots. The scarcity of money and consequent difficulty in payment of labor has caused a temporary suspension of production in many lines until such times as collections could be made. Many of the Schuylkill Valley stove foundries, for instance, have been working but two or three days a week, and some have closed entirely, purely because of financial considerations; and in other departments of business there has been a similar shrinkage in consumption. There is, nevertheless, a great deal of business which will not admit of indefinite postponement, and with any general revival in the demand it would not require much time for prices to stiffen considerably. The stove trade especially ought to pick up; this is usually their busiest season, yet there has been no time for years past when so few goods have been manufactured. The trade may be curtailed somewhat, but it is not all lost, and there may yet be a big demand for Foundry Irons. Meanwhile, however, it must be conceded that the demand is light and prices inclined to droop, especially for cash or for good short time offers. Nominal quotations are about as follows for Philadelphia and near-by points: Say, about $13 @ $13 50 for Plain No. 2, $13 75 @ $14.25 for No. 2x and $14.50 @ $15 for No. 1x.

The Pittsburgh market is reported as being in an extremely unsatisfactory condition, there being very little demand. The mills that are in operation are using material bought some time ago, and as none of them are working up to their full capacity, many of them will not be ready to buy for some time yet. Production has been reduced more than one-half, and yet reports of stocks show that more Iron is being made than is being consumed. It is the impression that it will take considerable time before any material improvement, either in demand or price, will be felt. We quote as follows:

No. 1 Foundry	13 00 @	13.25	cash.
No. 2 Foundry	12.00 @	12.25	"
Charcoal Foundry No. 1	15.00 @	16 00	"
Charcoal Foundry No. 2	14.00 @	15.00	"

Slight symptoms of a revival of business are apparent in the Chicago district. Consumers who have had their Iron held back for quite a long time are now ordering shipments on the contracts. It is further stated that parties who have been trying to buy at very low prices, and were out of the market for some time on that account, are now coming in and paying makers' prices. The volume of business in this way is by no means large as yet, but the prospects are certainly more encouraging. The trade promises to run up to a fair volume during the fall months, and manufacturers are feeling a little more cheerful over the outlook. Quotations are unchanged, but are still subject to the previous remark that concessions are made for prompt cash or immediate delivery.

There has been little if any increase in the volume of business in Pig Iron during the past week in Southern markets, but it may be said that the urgency to sell is less pressing, although low prices would doubtless be still accepted for spot cash and prompt shipment. There is rather more inquiry for forward delivery, but at such low prices that the furnaces refuse to entertain the bids, asking an advance of 50¢ ℔ ton over what the Iron could be bought for with ready money. The production of Pig Iron has been so far reduced that with even a little revival in the demand it is evident that a scarcity of Iron would soon be developed. Quotations are nominally as follows:

Foundry.

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke No. 1	15.00 @ 15.25
Lake Superior Coke No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—Good support has been given the market by prominent operators, and, while speculation may fairly be said to be on strictly conservative lines, with carrying forward of old deals from current month to October delivery comprising the main deal, prices have averaged somewhat higher, and it is said that the leading holders seem inclined to put them up to nearly the basis of present cost of importation. Some of the statisticians figure it out that the consumption in this country

during August was quite up to that of the preceding month. They also make it appear that spot stocks have been reduced to 6710 tons, against 9100 tons held on July 1, and in quarters where "bullish" sentiment is most pronounced it is claimed that Europe will be drawn upon for supplies in the near future. They figure it out that only four months' supply remains in first hands in this country and picture a lively experience before the end of the year, with an advance in prices to the parity of cost in London, plus 4¢ ℔ lb duty. During the past few days sales have been made at 19.50¢ @ 19.65¢ for prompt delivery, and 0.20¢ @ 0.30¢ has been paid to carry over September contracts to the following month. Sales were recorded of 10 tons at as high as 20.20¢ for November delivery. For small lots prices remain firm and unchanged at 21½¢ for Banca and 21¢ for Straits Pig.

Copper.—Nothing new has transpired regarding the export movement in Ingot referred to in last week's report, except that official records show heavy shipments recently, including over 1800 tons of Ingot, chiefly to Continental ports, Circumstantial evidence is strong, however, that the business on foreign account latterly has been fully as large, if not heavier, than generally reported, and even more significant is the fact that prices commonly quoted a week ago are now exceptionally low. Thus 9¾¢ would appear to be an exceptionally low quotation on Lake Superior Ingot, while 9½¢ for Electrolytic and 9¼¢ for common casting stock stand as sellers' figures against business at fully ¼¢ less very recently. Home trade demand has improved somewhat, and the combination of export and home trade movement suffices to give the market better tone, not only on private negotiations but on the Metal Exchange, where bearish maneuvering has been quite conspicuous of late. Bids there were raised to 9.65¢ for October and 9 75¢ for November and December deliveries of Lake Superior Ingot. Jobbers report a gratifying movement in the retail consumptive demand since the first of the month, orders and inquiries showing a decided increase in number, although almost entirely for small lots. The outlook from the dealers' point of view is considered more hopeful for a fair fall business. Prices on small lots are inclined to stiffen at the quotations of the past three weeks, namely 11¢ for Lake Ingot, 10½¢ for Ansonia Grade Arizona and 10¢ for Casting.

Sheet Copper.—The improvement in demand for Cornice Copper, noted last week, has continued, although considerably below the usual average for the present season. There appears to be, however, a better feeling among consumers, and as stocks are believed to be unusually low throughout the country, a very fair amount of business is looked for within the next few weeks.

Pig Lead.—The market has been very firm, with the higher level of prices that were established last week fully maintained and a fair business effected. Several round lots of common Western were taken at 3.75¢ and about 150 tons at 3.80¢ @ 3.85¢, the latter being the ruling price at the close. Dealers' price for small lots of American Pig shows $\frac{1}{10}$¢ advance over last week. For larger lots 4¢ ℔ lb is still the ruling rate, the consumptive demand being only moderate.

Lead Pipe and Sheets.—The demand for Manufactured Lead is of a dull and irregular character. Manufacturers will, it is believed, make a new scale of prices for Lead Pipe and Sheet within the next few days, in order to bring them up to a parity with the sharp advance which has taken place lately in the value of Pig.

Spelter.—Sales of 15 or 20 carloads recently have served to stiffen the market considerably, and at present there is little if any ordinary Western stock offering at less than 3.70¢ @ 3.75¢. Carload lots have realized 3.62½¢. Choice brands are held at 4¢ upward.

Sheet Zinc.—The retail demand shows no signs of improvement, there being but little doing in this material. Prices are weak and for small lots the rate per pound is noted ¼¢ lower.

Antimony.—Demand is fair and prices are quite steady. We quote at 11¢ Cookson's and 10½¢ Hallett's, for small lots.

Tin Plates.—The improved demand for Coke Plates for canners' use noted last week has continued during the present week. It is, however, almost wholly for moderate quantities and for spot delivery. Baltimore oyster packers are now coming into the market for this material, and a considerable increase in inquiries from that district has been noted within the past few days. The market for "futures," however, continues as dead as ever, showing that what stock is purchased is only such as is imperatively needed for present requirements. Prices on imported Cokes are somewhat stiffer, due probably to the better demand above mentioned as well as to the material contraction in Welsh production, owing to the shutting down of the majority of the tin-plate works in South Wales and Monmouthshire. In other lines of Tin Plate there has been an increase of sales over last week, and considerably more inquiry since the first of the month. The business done is, however, of a satisfactory nature, in that orders, although for small quantities, are more frequently repeated, and collections are considerably easier. Roofing Plates continue in moderate demand, well distributed. Some good sized orders have recently been shipped to the South, and more business is looked for from that quarter. Stocks are very low in all parts, consequently a fair running demand is considered to be assured for some time; but, with the possibility of tariff changes looming up in the future, it is unlikely that either importers, dealers or retailers will burden themselves with any heavy stocks until it is known what form the changes, if any, will take. Shipments from the other side have been unusually light for the past few weeks, and we understand that American importers are holding down orders to the smallest margin possible. Prices are fairly steady, although concessions on those quoted may be had in many cases for desirable orders and prompt cash. A London cable to *The Iron Age*, dated September 6, reports on the English market as follows: The Tin-Plate market has remained slow. American inquiries have been fair, but there is hardly any demand from 'Frisco or Canada. The closing down of many works fails as yet to stimulate prices. Liverpool quotations are as follows:

IC Charcoal, Alloway grade	12/9 @ 13/3
IC Bessemer Steel, Coke finish	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12/
IC Coke, B V. grade, 14 x 20	@ 11/6
Charcoal Terne, Dean grade	@ 11,6

Sheet Iron.—The demand for Black Sheets shows a slight improvement, but the demand is still exceedingly moderate. Orders for fall delivery, which were placed with the mills earlier in the year, are keeping manufacturers' business in gentle motion, but although the production has been greatly restricted, supplies are considerably larger than the demand. Galvanized Iron continues in good demand and stocks are said to be running quite low. Many of the idle mills may, however, be expected to start up again on any sign of scarcity being apparent, when prices may be advanced, or cost of production be reduced by lowering of wages.

Among recently authorized corporations in Illinois are the following: Rulke Pressure Blower Company, Chicago; capital stock, $1,000,000; incorporators, Peter Hartford, J. L. Hughes and Edgar M. McCauley. The Chicago fire Engine Company, at Chicago; capital stock, $10,000; for manufacture of chemical fire extinguishers and fire department supplies; incorporators, C. D. Stone, W. S. Baker and J. M. Ferguson. Dalton Company, at Chicago; capital stock, $20 000; for the manufacture of heating and plumbing plants; incorporators, John F. Dalton, Peter H. Dalton and Wm. Clamsky. The Choteau Pneumatic Hammer Company, at Chicago; capital stock, $5000; for the manufacture of tools and machinery and for general contracting; incorporators, Frank A. Lapham, Daniel Egan and J. W. Dunthy. Hercules Ice Machine Company, at Aurora; capital stock, $500,000; for the manufacture of machinery and apparatus of all kinds; incorporators, Edward Worcester, W. H. Cottrell and Joseph H. Defrees. This company will be formed to take over the business of the Hercules Iron Works, forced into insolvency by the burning of their cold storage plant at the World's Fair.

Chicago Report.

Scrap.—There is no improvement in the demand, and dealers' buying prices are maintained at the following low range :

	Per net ton.	Per lb

THE WATSON PERFECT COMBUSTION HEATER COMPANY of Toronto, Canada, have one of their new Furnaces on exhibition in Annex D, boiler-room extension of Machinery Hall, at the World's Fair. They claim practically complete combustion, smokeless and odorless, of soft coal. The Furnace is shown in operation. Their advertisement appears elsewhere in this issue.

WALLACE & SONS, 29 Chambers street, New York, are about to send out Catalogue No. 7, fully illustrating the Lamp Fixture, Table and Art Goods department of their business. In its 141 pages will be found full lines of Banquet, Boudoir, Piano, Library, Hall and Table Lamps, in onyx, gold and silver plate, &c.; Dressing and Jardiniere Stands, Chandeliers, Brackets, Spring Extensions, Five o'Clock Teas, Blazers, Tables, Cabinets, Pedestals and Chafing Dishes. There are also Burners, Lamp Trimmers, Extinguishers, Police Lanterns and Plantation Lamps. Facing the title page is a bird's-eye view of their works at Ansonia, Conn. The book is printed on fine paper and for greater convenience doubly indexed.

CONDITION OF THE

Hardware Trade.

REPORTS of improved feeling are being received from different parts of the country, and there is no doubt that with the improvement in the financial condition there is a more hopeful tone in business circles. This is certainly true of the Hardware market, and this feeling is reflected in the reports which are given below from representative houses in the principal centers. The stagnation which characterized the market a few weeks ago is being succeeded by a slight movement, as there is a very perceptible increase in the volume of business. Some of the large jobbing houses who during the past month placed exceedingly few orders, and those only to meet their immediate necessities, are beginning to replenish their stock and purchasing such goods as are needed to complete their assortment and put them in a position to meet the demand which is expected during the next few weeks. They are, however, purchasing very conservatively, with an entire absence of the speculative spirit, preferring to take their chances of higher prices or difficulty in obtaining goods rather than purchase beyond their sure requirements. Traveling representatives of manufacturers and jobbing houses are sending in more frequent and somewhat larger orders, but the trade in general throughout the country are pursuing the conservative course of the wholesale houses referred to above. Manufacturers whose works have been closed are beginning to resume operations, and some who have been working on short time are increasing or preparing to increase their output. Some factories are, however, still closed, having stocks on hand sufficient to meet the present demand and being indisposed to accumulate goods. A feature of the business situation which is exceptionally satisfactory is the extent to which prices have been maintained, as manufacturers generally have refrained from cutting prices with a view to inducing sales. There have, of course, been some exceptions and in special cases some lower prices have been made, but, as a rule, quotations are well maintained and manufacturers are refusing to sell goods at unremunerative prices. There is still much difficulty in making collections, but there is less reason for complaint in this regard than during the past month or two, and the trade are thus receiving the benefit which results from the improved financial condition of the country.

Advices from Chicago.—The volume of business in Shelf Hardware is now denominated fair, having made steady progress toward improvement since the depth of depression was reached early in August. Seasonable goods are most in demand, such as Coal Hods, Stove Boards, Lanterns, Scoop Shovels, &c., but it is found that when merchants make up such orders they usually look over their stock and include small lots of other goods needed for sorting up. Prospects are getting better and travelers, through the Northwest particularly, are more hopeful for a good fall trade than they have been. Heavy Hardware jobbers report their branch of business as running considerably lighter than usual at this season. Carriage and wagon builders are very quiet and the demand from this direction is only for material needed for repairs. Manufacturers' agents are having a fair trade only, but are receiving better orders from jobbers than from retailers. The latter are buying only from hand to mouth and this will throw a great deal of their trade in the coming months to jobbers. Some of the jobbers are anticipating this condition of business and are now laying in better stocks, so as to be able to meet the demand. The long drought has caused a much larger trade than usual in Tire Bolts, so that manufacturers in that branch have had less reason to complain than their colleagues in other lines.

Notes on Prices.

Wire Nails.—The Wire-Nail market has not developed any specially new features during the past week. The mills, generally, are resuming operations, though not to their full capacity. Quotations continue unchanged at $1.50 for carload lots, f.o.b. mill, a price which is pretty firmly maintained, most of the manufacturers not showing a disposition to shade it. The volume of business is small, but some orders, principally to replenish broken stocks, are being sent in. The trade, notwithstanding the possibility of advanced prices as a result of agreement between the manufacturers, are not placing stock orders to any considerable extent, but are limiting their purchases to their immediate requirements. Small lots from store in New York are held at about $1.65.

Advices from Chicago.—Orders for Wire Nails have been more numerous and a little large during the past week, but prices show no improvement. Efforts made by some manufacturers to increase their sales have had a tendency to shake the growing belief in firm prices. The low rates named, it is true, have been for spot cash and immediate shipment, but the market now seems to be settling down again to about $1.50 to $1.55, Chicago. Jobbers are doing a good business at $1.55 to $1.60 from stock.

Cut Nails.—The Cut-Nail market continues steady on a basis of $1.05 for carload lots at mill, with concessions in special cases. The volume of business is moderate, and for the most part confined to small lots to meet the pressing needs of the trade.

Advices from Chicago.—Manufacturers of Cut Steel Nails report a continued flow of small orders, which they think is

indicative of the character of trade to be expected this fall. They are not looking for a much larger volume of business in view of the conditions prevailing in the commercial and financial world. Prices are maintained at $1.20 to $1.25 Chicago, for factory lots. Jobbers are doing a fair local trade, but have little demand from outside buyers and are selling small lots at $1.30 from stock.

Barb Wire.—There has been as yet no considerable increase in the demand and the volume of business is light. Prices are, however, pretty well maintained on a basis of $2.45 to $2 50 for carload lots at mill for Four-Point Galvanized. This figure, however, is shaded in some cases and with perhaps a little more freedom than during the past few weeks. More trade is noted among Barb-Wire manufacturers, but they are not yet in receipt of enough orders to justify the starting of all the idle factories. Prices range from $2 45 to $3.60 for Galvanized Barb Wire, according to quantity and brand. Jobbers report a considerably better trade and more inquiries coming in from other localities which have hitherto not been buying much. They sell small lots from stock at $2 65.

Cary's Box Strap Stretcher.—Cary Mfg. Company, 5–9 Elm street, New York, are offering the trade their Box Strap Stretcher for tightening straps on packing and other cases at 75 cents each, less 33⅓ per cent. discount, when ordered in fair quantities.

Cork Extractor.—The Magic Cork Extractor, manufactured by Magic Introduction Company, 321 Broadway, New York, is sold to the trade at $2 per dozen net, or $22.50 per gross.

Shot.—The following changes in prices of Shot were made on September 6 :

Drop Shot, up to B, 25-pound bag	$1.45
Drop Shot, up to B, 5-pound bag	.35
Drop Shot, B and larger, 25-pound bag	1.70
Drop Shot, B and larger, 5 pound bag.	.40
Buck and Chilled, 25-pound bag	1.70
Buck and Chilled, 5-pound bag	.40
Dust Shot, 25 pound bag	2.00
Dust Shot, 5-pound bag	.45

In lots of 2000 pounds and upward, taken at one time, a discount of 5¢ ℔ bag (25 pounds) and 2½ % will be allowed. Terms : Net, 30 days, or 2 % discount will be allowed for cash remitted within ten days from date of bill. Freight equalized with any Shot manufacturing point.

Old Rubber.—The market for this material continues dull. The following quotations denote approximate prices, New York delivery :

Car Springs, ton lots, ℔ lb.	....	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb..	....	@	.03
Rubber shoes, less than carloads, ℔ lb	2¼	@	.03⅛
Large Hose, ℔ ton	....	@	9.00
White Wringer Rolls, ℔ lb.	....	@	.04¼
White Syringes, ℔ lb.	....	@	.05

Old Rags, Paper, &c.—Little is doing at present in these lines, and the market maintains a condition of dullness. There are, however, indications of a better feeling, which, with the resumption of operations by paper mills, expected in the near future, may develop a material increase of business before the end of the month. Meanwhile prices are about as follows, delivered in New York :

No. 1 White Rags	℔ lb 3	@	3¼¢
No. 2 White Rags	℔ lb		1¾¢
Mixed Rags	℔ lb		¾¢
Blues and 3ds	℔ lb		1 ¢
Hard Sized White Shavings	℔ lb		2⅛¢
No. 1 White Book Shavings	℔ lb 2	@	2⅛¢
No. 2 White Book Shavings	℔ lb		1¼¢

No. 2 Mixed Shavings	℔ lb		⅛¢
No. 1 Printed Books	℔ lb 1	@	1¼¢
Ordinary Mixed Books	℔ lb ½	@	¾¢
Newspapers	℔ lb		⅛¢
No. 1 Manila Paper	℔ lb 1	@	1⅛¢
No. 2 Manila Paper	℔ lb ⅝	@	¾¢
Bogus Paper	℔ lb		½¢
Common Paper	℔ lb ¾	@	½¢
Straw Chips	℔ lb ⅛	@	⅛¢
Binders' Clippings	℔ lb ½	@	⅝¢
Jute Butts	℔ lb		1 1-10¢
No. 1 Jute Bagging	℔ lb		1¼¢
Mixed Bagging	℔ lb ¾	@	1 ¢
No. 2 Bagging	℔ lb ½	@	¾¢
Hemp Twine	℔ lb		2¼¢
Manila Rope	℔ lb		2½¢
Jute Rope	℔ lb 1½	@	1¾¢
Mixed Rope	℔ lb ¾	@	⅞¢

Old Metals.—There is a little more movement in the market for Old Metals. Prices depend largely, however, upon special circumstances, urgency of need for material, &c. The following quotations for New York are therefore only approximate :

Heavy Copper	℔ lb		8¾¢
Light and Tinned Copper	℔ lb		7½¢
Heavy Brass	℔ lb		6¢
Light Brass	℔ lb		5¢
Lead	℔ lb		3¢
Tea Lead	℔ lb		2¾¢
Zinc	℔ lb		2¾¢
No. 1 Pewter	℔ lb		14¢
No. 2 Pewter	℔ lb		7¢
Wrought Scrap Iron, ℔ gross ton	$12.00	@	$14.00
Heavy Cast Scrap, ℔ gross ton,	8 50		
Stove Plate Scrap, ℔ gross ton,	5.50		
Burnt Iron (delivered at mill), ℔ gross ton	6.75		

Trade Notes.

In an advertisement on another page the Vanderman Plumbing & Heating Company, Willimantic, Conn , call attention to some of their special tools for plumbers and steam fitters' use. Among the goods noted are Lead Pipe Cutters, Lead-Pipe Benders and a Joint Runner. They also invite the trade to send for Vanderman's Plumbers' Estimate and List Book, published in two editions, the prices of which are given.

In another part of this issue Joseph Huse & Son, 95 Blackstone street, Boston, Mass., call the attention of the trade to their complete line of Mica.

The Geuder & Paeschke Mfg. Company of Milwaukee, Wis., advise us that on account of a fire occurring in their warehouse August 30 their stock of manufactured goods in the warehouse was totally destroyed, incurring a loss of about $22,000, which, however, is fully covered by insurance. Their factory and general stock rooms, being located in an entirely different part of the city from this warehouse, are intact and, as they have a very large stock of raw material to replace the goods destroyed, they will suffer but little inconvenience and are in shape to fill all orders for Tinware and Sheet-Metal goods with but very little delay.

Sidney Shepard & Co., Buffalo, N. Y., issue a pamphlet of some of their wares, entitled "Seasonable Goods for the Months of," below which is a calendar for six months beginning with August, 1893, and ending with February, 1894. Sheet-metal goods of various sorts are noted, such as Coal Hods, Coal Vases, Stove-Pipe Elbows, Tea Kettles, Oil Cans, Eave Troughs, Stove Boards, &c. Other goods are Registers and Ventilators, Dampers, Lanterns and various Kitchen Utensils.

A J. Corcoran has removed from 76 John street to Corbin Building, Broadway and John street, New York. This firm manufacture the well known Corcoran Windmill; also Wood Tanks, Pumps, Tank Valves and Fixtures. Circulars are issued describing the Tanks made by A. J. Corcoran, which are both rectangular and round and of various sizes. These Tanks are used in many parts of the country and one of the circulars gives a list of those who have made use of them. Mr. Corcoran had been at 76 John street for about 26 years.

The Eastern Tinware Company's factory at Portland, Maine, started up on Monday on 40 hours' time in order to fill orders for goods.

The Lalance & Grosjean Mfg. Company's rolling mill, at Harrisburg, Pa., was started into full operation on Monday last. The firm's factory at Woodhaven, L. I., is running on half time, temporarily.

The Columbia Can Machine Company have been organized at Saco, Maine, with a capital of $250,000, to manufacture cans of all kinds, as well as tools and materials.

The Burns Stamping & Mfg. Company of Chicago Ridge, Ill., have been forced to place their affairs in the hands of a receiver. This, however, is not due to financial embarrassment, as has erroneously been stated in the Chicago newspapers. The trouble grows out of the location of the factory on a tract of land donated to the company by a land association. The company have complied with their part of the conditions preliminary to the passing of title, but the land association interposes objections which are considered unwarranted, and refuses to grant the deed. This puts the company in a peculiar position at this time, and a stockholders' bill was filed to protect their assets and bring the matter to a focus. The company have good reason to expect a decision by the courts in their favor, and their creditors are giving every assistance in tiding over the present unsatisfactory state of the company's affairs. Prospects for future business are excellent, and the managers of the company look forward to a prosperous career as soon as this controversy is settled in their favor.

The Anthony Wayne Mfg. Company, Fort Wayne, Ind., have prepared a repair chart, for hanging, of the parts of the Anthony Wayne, Wayne American, Western Star and Wayne Combination Washers. On one side of the chart are illustrations of the parts, numbered or lettered, and on the other side the names of the part with the price of each. This arrangement simplifies the ordering of repairs, as well as acquainting the merchant with the price to be charged.

Joshua S. Ingalls & Co. of Troy, Ohio, manufacturers of Craig polished Sheet Steel, have run their mill steadily since the beginning of the year, and have sold more Steel up to date than last year. They have not reduced their force by a man, nor have they reduced hours or wages.

News and Notes.

Negotiations between the governments of Japan and Mexico in regard to the introduction of Japanese labor into the latter country have been carried to a successful issue. Japan will permit her people to emigrate to Mexico, whose Government will, in turn, guarantee them protection. They are needed for employment in the coffee, sugar and cotton plantations of the Republic, as well as in the mines and factories.

The Baltimore *Sun* states that four steamers laden with an aggregate of 13,000 tons of iron ore from Santiago, Cuba, were discharging at Sparrow's Point, Md. It is said that the Maryland Steel Company will store 40,000 tons of ore in bond, and unless business becomes more active the company will work upon what is stored, which means a temporary curtailment of imports.

Scrap-iron dealers in Boston are agitated over the threatened action of the Navy Department in discontinuing the use of scrap iron for the manufacture of chain cables at the Boston yard, owing, it is said, to tests made having proved that chains made from scrap are inferior in tensile strength to those made from new bar iron.

An international agricultural exhibition is being arranged in Vienna for April, May and June, 1894.

Talk of an underground system of rapid transit for New York is cropping up again.

The new United States cruiser "Olympia" had her first trial trip on the bay at San Francisco on Thursday. Everything is reported as having been satisfactory and it is expected that more than the contract 20 knots will be obtained from the vessel when the official trial is made.

The Manitoba Government has issued its official bulletin regarding the crops of that province, which in all sections are reported as excellent. The estimated yields are given as: Wheat, 22,000,000 bushels; oats, 16,000,000 bushels; barley, 4,000,000 bushels; and flax, 150,000 bushels.

The Watkin tower, at Wembly Park, near London, is approaching completion. Sir Benjamin Baker is the engineer of this great erection, which, when finished, will have a hight of 1150 feet, or 176 feet more than Eiffel's tower in Paris.

Among the recent arrivals from Europe were Andrew Carnegie and Henry Phipps, Jr.

The Commissioner of Patents has refused an application for a trade-mark, applied for by Governor Tillman of South Carolina, for whiskies dealt in by the State, on the ground that the State has no right to trade in liquors, except within its own limits, and is therefore not entitled to a registered trade-mark.

Arrangements are being made by the Federal immigration authorities for the establishment of inspecting stations at various points on the Canadian frontier in order to maintain a more efficient system for the inspection of immigrants coming to the United States by way of Canada.

The Present Labor Market.

It has been noticed by the New York tinners that there are at the present time quite a number of Western tinners in the city looking for work. Inquiries about Boston discover that city to be the final destination, though why or what they intend to do when they get there is unknown. A short time since a great many of the local plumbers were visiting the different shops in search of a job, but at present the number out of work is noticeably less. The steam and hot-water fitter has been more fortunate all through the dull season, for while many did not have work all of the time every one had more or less work each week. Men who have some experience or aptness in stove jobbing are now finding employment in that field in the absence of work at their regular trade or something more agreeable.

Deterioration of Products.

The market is now flooded with cheap articles whose actual value, as based upon the service they will perform compared with their cost, shows them to be much dearer than articles of better quality costing much more. An amusing illustration of this is to hand in the experience of a gentleman upon whose premises had come a plague of mice. Traps for these nuisances, of a variety tried years ago and found excellent, were purchased at 8 cents apiece. When first introduced this sort of trap was "a killer," and hence was selected in full anticipation that by its aid the nuisance would speedily be abated. But these traps in the days wherein they made a reputation sold at 25 cents each. The householder preferred to set his traps in favorable positions with tempting baits of cheese rind, but the only things captured were the baits. The mice went in, gratified their appetites with a dainty lunch, and then, as they could not go out the way they came in, squeezed their way through the wire bars with little effort and apparently no inconvenience, and held themselves in readiness to accept, with thanks, any future invitations to similar lunches that might be extended to them. The purchaser of these traps is now occupying himself with attempts at determining how many mouse traps at 8 cents apiece, that will catch no mice, would equal in value a good, serviceable trap, for which 25 cents is the retail price.

Manners and Money.

The art of all arts is the art of succeeding, and success in business requires tact. Tact, in turn, is simply an intelligent use of commercial politeness. The time has gone when a surly, ill-tempered and excitable man can hope to work his passage to success. It is as necessary for a salesman to possess tact and a polite manner, adjustable to his customers' preferences, as it is for him to be intimately acquainted with the details of the goods themselves. Take a salesman of tact out of a dry goods or grocery store and put him behind the counter of a hardware store and he will sell more goods and earn a larger salary than an ill-tempered hardware clerk who has spent his life among the nails and locks. This same principle is seen in the versatile talents of business men, who make an equal success of any line of trade they engage in, for the reason that they bring to bear upon the particular line their tact and polite manners, and this holds their customers regardless of outside competition. When you go to buy a box of pens, or a loaf of bread, you don't always go to the store which has the largest variety or the closest prices, but from force of habit and personal preference patronize some smaller store where you meet a clerk or proprietor whose manners are agreeable and cordial.

True Politeness.

Politeness, however, to be of much permanent value must not be a mere veneer of fine words and "soft soap" mannerisms; it must have a sincere atmosphere, which is only the result of a real interest in the public, not only individually, but as a class. The kind of politeness which utters fair words and sweet promises to the face, and laughs in its sleeve behind the back of the customer, only survives until its deception is discovered. The man who cringes for public patronage with his mouth and hates the public in his heart has never touched the lever of real manners, which are born from within and not hatched on the surface. We often meet people who speak of "the public" as if it were a separate race of people entirely distinct from themselves, forgetting that "we" are the public, and that in honestly serving the public we are simply serving ourselves. A man can no more separate himself from the public by imaginary barriers and succeed in business than he can lift himself off the ground with his boot straps. When a man has real politeness, he practically takes the same view of his goods as does the customer, and finds no pleasure in forcing a sale which is not a fair exchange of values. The short-sighted man may think he is losing ground if he lets a customer go out of his store without purchasing something, but many of the best paying customers a merchant can have are secured by looking after their end of the bargain, and declining to urge goods which he, himself, would not care to purchase for the purpose required. This does not imply that a merchant needs to be indolent in pushing for sales, or lacking in enterprise; it means that the merchant who can, in some slight degree, assume the position of an impartial advisor as regards the interests of his patrons will succeed where a dozen "hustlers and bluffers" would signally fail. It is all right to slap your customer on the back and ask about the health of his youngest child in an anxious manner, but it is not just the thing to injure his spine in the operation, or apply the same treatment to a bachelor.

Withholding Information.

Notwithstanding the indisputable evidence that a change of ideas is profitable, many men otherwise liberal treasure up for their own exclusive use the information derived from personal experience. It is a well-known fact that the most advanced students in all fields are inspired with new ideas from those who seek their aid, and are in return ever ready to give all information in their power. With such examples on every hand a merchant is often found who will not help another, though in a different line, with a suggestion that would save his name and business. There are many salesmen who will let another lose time and sleep accomplishing results that could be readily accomplished by a mere hint from them. There are tinners, plumbers and heating men who have learned little things, sometimes themselves, but more often from others, that they could give without disadvantage, yet withhold while seeing their fellows suffer great inconvenience from the lack of the information. Though often enough this withholding of information is due to a mean spirit, in far too many cases it is due to indifferent interest or lack of ambition. If you know something that could be as valuable to others as it is to you just see if you don't profit most in the end by giving it to several. "He has got to leave his gold where it won't melt" is often exultingly said of the despised miser, but how much more despicable

is the man whose mind is stored with golden information and who daily refuses while living to rise equal to the dead miser by leaving his hoard to become valuable to others when it can no longer benefit him.

Electric Fans.

As the summer passes we see more and more of the electric fan. It has come to stay, and seems to mitigate, to some extent at least, the oppression of a hot and stuffy room. It produces merely a circulation, not a renewal of the air, but its results are decidedly beneficial. When we look back only a decade and see the impossibility of the introduction of such a fan, simply from lack of motive power, we may more fully appreciate how rapid has been the introduction of this article of comfort and convenience. Each season brings out new designs, but all of the general type of the disk or propeller face, with motors of more varied descriptions. No great change is, however, likely to result in prevailing styles, and more thorough circulation with true ventilation (a renewal of the air) will doubtless come through the adoption of electrically driven incased paddle fans to force cool, fresh air into the apartment.

Burnt Air.

BY L. M. W.

The freqent use of the "burnt air" argument by those who find in it some advantage suggests that more light on the subject might be of advantage. Any one who will take the trouble to critically examine the subject and study authorities will find that it has been demonstrated that air heated to a temperature of several hundred degrees and afterward cooled had in no way deteriorated. If the passing of air over perfectly clean red hot plates by which its temperature was raised 1000° does not destroy its invigorating influence or vitiate it in any way, the question arises, to what is due the disagreeable experience that we all have so positively felt at times? The smell is due to dust in the air, and the fact that all dust is not gold dust leaves the reader to guess what kind of cremated dust he is inhaling, and whether it is worth while to go to some trouble to filter out this objectionable commodity. Another impression of burnt air is derived from the effects of overheated air on the mucous membrane with which it comes in contact through breathing. It also creates a stifling sensation, partially due to the fact that after a good full breath only a trifle more than half as much oxygen has been drawn in as would have been if the temperature had been half as high, for it must be remembered that air expands considerably in reaching a high temperature. Very hot air, furthermore, is ordinarily very dry and naturally absorbs moisture rapidly, leaving the throat and the exposed membrane parched and inflamed to a greater or less extent, making them very sensitive to changes of temperature. Do not malign the air by saying it is burnt, for the only thing burnt is the possessor of the imperfect hot air heating system.

Protection from Lightning.

The following article by Alexander McAdie is reprinted from the *Popular Science Monthly*, several illustrations from photographs of lightning flashes being omitted:

During the year 1891 205 lives were lost, that we know of, in the United States, east of the Rocky Mountains, directly through the action of lightning. How many were lost indirectly, and how many cases there were of shattered health and more or less permanent injury, we can only surmise. The financial loss due directly to lightning was certainly not below $1,500,000 To get at something like a commercial estimate of the damage done by lightning in the past few years in this country, I have made use of the *Chronicle* fire tables for the six years 1885–90, and find that some 2223 fires, or 1 3 per cent. of the whole number, were caused by lightning, and the total loss was $3,386,826, or 1.25 per cent. of the whole amount lost by fire. During 1892 we have a record of 292 lives lost. The damage may be estimated at as high a figure as in 1891. These losses are the more appalling when we recall that the year is virtually less than six months. Over 95 per cent. of the casualties due to lightning occur between the months of April and September. It is, therefore, quite pertinent at this time to discuss the question whether or not we are able to protect ourselves from lightning. Some five years ago the question would have been answered readily and with all sincerity, "Yes, a good electrical connection with the earth—a stout, continuous copper rod, for example—will suffice" To-day no such answer can pass unchallenged, for reasons which we shall see.

In 1888, after years of dispute, we had first settled down to the calm enjoyment of the belief that rods did protect. The Lightning Rod Conference had shown, in quite an exhaustive report, that Faraday's position (as opposed to the opinions of Harris) was correct, viz —that the problem was one of simple conductivity; that a solid rod was better than a tube or tape, which would give greater surface with less copper; that solid volume was everything, superficial area nothing; and that, provided the metallic passage afforded the flash was continuous, any flash might be successfully carried off and harmlessly conducted to the ground. This conference, while not strictly an official body, was one that, from the character of its members, carried great weight. It was a joint committee of representative members of the Institute of British Architects, the Physical Society, the Society of Telegraph Engineers and Electricians, the Metrological Society, and two co-opted members.

In 1888 came Dr. Oliver J. Lodge's remarkable course of lectures before the Society of Arts upon the oscillatory character of the lightning flash. Then followed the famous discussion at the meeting of the British Association. As this debate was one in which quarter was neither asked nor given, and the question at issue was clearly understood by all to be whether a lightning conductor, when constructed in accordance with the directions of the conference, would absolutely protect, it may not be out of place to give here a synopsis of the arguments advanced. Mr. Preece, who opened the discussion, defined the functions of a lightning conductor as twofold: "It facilitates the discharge of the electricity to the earth, so as to carry it off harmlessly, and it tends to prevent disruptive discharges by silently neutralizing the conditions which determine such discharges in the neighborhood of the conductor. To effect the first object, a lightning conductor should offer a line of discharge more nearly perfect and more accessible than any other offered by the materials or contents of the edifice we wish to protect. To effect the second object, the conductor should be surmounted by a point or points; fine points and flames have the property of slowly and silently dissipating the electrical charges; they, in fact, act as safety valves If all those conditions be fulfilled, if the points be high enough to be the most salient features of the building, no matter from what direction the storm cloud may come, be of ample dimensions and in thoroughly perfect electrical connection with the earth, the edifice, with all that it contains, will be safe, and the conductor might even be surrounded by gunpowder in the heaviest storm without risk of danger All accidents may be said to be due to a neglect of these simple elementary principles. The most frequent sources of failures are conductors deficient either in number, hight, or conductivity, bad points or bad earth connections; . . . and there was no authentic case on record where a properly constructed conductor failed to do its duty. . . . He personally had under his supervision at that present moment 500,000 lightning conductors, and, fixed throughout the offices (post office and telegraph) had apparatus protected by about 30,000 or 40,000 lightning protectors."

Dr. Lodge said that "if his views were correct, very few buildings are effectively and thoroughly protected at the present time. . . . He had read carefully the conference report, and found a large number of entire failures; . . . one noteworthy one, a brass rod an inch thick on a steeple which was smashed to pieces and the spire destroyed. Again, the best protected building in the world, the Hotel de Ville, at Brussels, on which M. Melsens had spent so much time and trouble. It was elaborately protected; protected by innumerable conductors with admirable earths made in a variety of ways, bristling with points all over the top—everything carried out in the most approved style, regardless of expense. Yet in the month of June the building was struck and set on fire. . . If a lightning conductor can prevent a flash from occurring by its repellent action, well and good; but he had shown in his lectures that there are cases where a point has no protective action whatever, when a point could be struck by a thick and heavy flash. There were other cases where the point acts with a brush or fizz and neutralizes the electric charge without a flash. They could not always do it. And so the lightning rod has two functions; one is to be repellent if it can, and the other is to carry off a flash when it cannot help receiving it. There was a certain amount of energy which they must dissipate somehow, and they could not expect to *hocus pocus* it out of existence by saying they could conduct it to the earth. The quicker they tried to conduct it down to the earth the more searching and ramifying disturbances they were likely to get. It might be better to let it trickle down slowly by using a moderately bad conductor than to rush it with extreme vehemence down a good conductor, just as it would be safer to let

a heavy weight suspended in a dangerous position down slowly rather than let it drop as quickly as possible. . . . If a man holds a lightning conductor when a flash passes down it, he will most likely be killed. . . . It did not matter about the earth; . . . a spark was likely to occur . . . he had made experiments in the laboratory with a rod very thick and a yard long, in circuit with a Leyden jar discharge. He took a platinum wire as fine as possible to make the contrast greater, and arranged it so as to make a kind of tapping circuit; if, then, the bottom end was arranged so as to be in contact with the rod and then let the top end be ⅛ inch away, then they would have a splendid conductor, better than any lightning conductor ever was. They would have no trouble about earth. It seemed absurd for any portion of the discharge to leave this conductor to jump across and make for the little strip of wire. Nevertheless, a portion of it did, and from every spark that went to the conductor, a side branch went to that little wire. . . . What are the conditions of a flash? He assumed that a flash behaved like experiments in the laboratory, but it was a question whether a cloud discharge was of this kind. A cloud is not like a conductor; it consists of globules of water separated from one another by interspaces of air; it may be compared to a spangle jar; when a spangle jar discharges, you have no guarantee that the whole of it discharges—it discharges in a slowish manner. It might be that there was with a cloud first a bit of a discharge and then another bit, and so on, so that there might be a kind of dribbling of the charge out of it, and they might therefore fail to get these sudden and oscillatory rushes. . . . But we must provide for the possibility of a sudden discharge."

Hon. Ralph Abercromby contributed to the discussion facts brought out by an examination of some 90 photographs of lightning flashes in different parts of the world. In one instance the whole air was filled with threads of lightning coming down like the roots of a tree from the sky. He thought it was very much a question where the area of protection would be when the whole air seemed to be pouring lightning down upon you. He would also like to find out whether buildings were struck during rain or when it was not raining. In connection with the fact that thunderstorms were confined to the lower ten thousand feet of the air, he mentioned the fact that in Norway there were two kinds of thunderstorms: one occurred in the summer, he believed, when the lightning clouds were high, and very little damage was done; on the contrary, in winter time the clouds were very low, and the churches were frequently struck.

Lord Rayleigh, Sir William Thomson and Professor Rowland discussed the questions whether or not the experiments actually represented the actual conditions. M. de Fonveille called attention to the most extraordinary lightning conductor in existence, the Eiffel Tower, and the fact that Paris was practically free from calamities produced by lightning, because a sufficient number of lightning rods had been erected according to the principles advocated by the many official boards, substantially the same as the conference. Prof. George Forbes thought a copper alternative path better than an iron one. Sir James Douglas, speaking from an experience of 40 years with a large number of conductors, was of the opinion that the rods, when properly constructed, were entirely adequate. In the matter of copper *vs.* iron he pointed out the practical consideration that iron corroded rapidly compared with copper. Mr. Walker further pointed out that this corrosion of iron was not a question of weather alone, but, as in the case of the top of the chimney of a factory, there would be some chemical action. Mr. Symons brought out with respect to iron conductors that galvanizing would not entirely overcome the difficulty.

(To be continued.)

WORLD'S FAIR NOTES.

E. W. Bliss Company

of Brooklyn, N. Y., and their Stiles & Parker Press Company, make a very large and interesting exhibit of presses, dies and special machinery for working sheet metal at Column L 42, in Machinery Hall. All the machines shown are belted up and can be put in operation for the instruction of visitors. They comprise specimens of the Nos. 3½ and 14 Bliss toggle drawing presses, Nos. 18, 19 and 21 Bliss adjustable power presses, No. 95½ Stiles straight-sided double-crank press, two Stiles drop hammers and Nos. 0, 1, 2, 3, 3½, 4 and 5 Stiles power punching presses. The No. 14 toggle drawing press is a huge machine used in the manufacture of large sheet metal ware, weighs 70,000 lbs., will take in a blank up to 44 inches in diameter, and will draw to a depth of 14 inches, making 7 strokes per minute. This machine, however, is not the largest built by the company. Their No. 209, not exhibited, takes a blank 60 inches in diameter and draws to a depth of 18 inches. The No. 3½ press takes a blank up to 20 inches in diameter and draws to a depth of 5 inches. The two presses shown serve their purpose in illustrating the system on which these machines are built. Cams are entirely dispensed with, the blank-holder being operated by means of toggles. According to the size of the press, one or two rock shafts are used to which the blank-holder slide is connected by means of toggle links. These rock shafts are operated from the main shaft by a peculiar system of link work which imparts through the blank holder a thoroughly uniform pressure to the blank. The strain arising from the pressure put upon the blank is transferred through the straightened toggles directly to the frame of the press instead of falling on the main shaft. In the larger sizes the company's new automatic friction clutch is used. Its action is practically instantaneous, avoiding entirely the heavy shock which, in the regular clutches, tends to destroy the clutch parts, frequently causing expensive delays and repairs. The adjustable power presses are specially adapted to cover nearly every kind of blank cutting, perforating, forming and combination die work, covering a large proportion of the operations needed in the manufacture of cans, pieced tinware, brass goods, trimmings, &c. In the presses shown there is a knock out attachment for discharging the work from the upper die, thus dispensing with springs, which often prove unreliable. The large double-crank press exhibited is intended for operating very large but accurate cutting and perforating dies, as, for instance, for armature rings, and is built very solidly and substantially. The drop hammers shown are of two styles, one being intended for forging, embossing, design stamping and other work requiring the dies to be keyed in the bed, while the other is adapted to sheet metal stamping. The power punching presses, of which such an extensive line is shown, are adapted to nearly every kind of blank cutting, punching, perforating, forming and bending, covering a large proportion of the operations needed in the manufacture of hardware, locks, cutlery, guns, sewing machines, typewriters and other articles made out of sheet metal. The pitman is made of steel, the crank pin runs in gun metal bushings, and the presses are further fitted with the Stiles eccentric adjustment, permitting rapid and very accurate adjustment and transmitting the pressure entirely through solid metal instead of throwing it upon screw threads; also with a patent graduated adjustment marked to $\frac{1}{100}$ inch, and with the Stiles automatic clutch, which allows the shafts to be turned for setting dies while the wheel is in motion without endangering the operator. In showcases samples are exhibited of the work done by these machines, covering a very great variety of shapes in different metals.

Jarecki Mfg. Company

of Erie, Pa., have an exhibit of pipe-threading and cutting tools at Column K 47, Machinery Hall. Their exhibit is very tastefully arranged, the large threading machines being placed along the sides of the space, while in the rear a pyramid of shelves has been built to hold pipe fittings and specimens of the work done on the machines. A unique arch, formed of threaded cast-iron pipe, fittings and branches, has also been built across the rear, towering above the pyramid. The machines shown are designed to cut and thread pipe from ¼ inch to 12 inches in diameter. They are operated in a variety of ways. Some are driven by hand, others by electric motors, some by belt from the exposition power plant and others by attached engines. They are shown in actual use and receive much commendation from pipe fitters for their ease of adjustment, convenient arrangement and good work. The dies are quick-opening and adjustable, each set of four pieces cutting two sizes of pipe. A large assortment of the Jarecki screw plates and pipe cutters is also shown.

One of the features of the exhibit is a showcase containing highly polished specimens of valves, nozzles, oil cups and other goods, arranged in a most attractive manner.

Photographs on Marble.

A German photographic journal gives the following particulars of a process used by a Mr. Villion for transferring photographs to marble: Coat an unpolished plate of marble with the following solution: Benzine, 500 parts; spirits of turpentine, 500 parts; asphaltum, 50 parts; pure wax, 5 parts. When dry, expose under a negative, in sunshine, for about 20 minutes. Develop with spirits of turpentine or benzine, and wash in plenty of water. Then cover the plate where it is intended to be left white with an alcoholic solution of shellac, and immerse the same in any dye which is soluble in water. After awhile, when enough of the coloring matter has entered the pores of the stone, it should be taken out and polished. The effect is said to be very good.

THE LETTER BOX.

Squared Roofing Tin.

From W. H. B., *Monroe, N. Y.*—"J. L." in *The Metal Worker* of September 9 makes a very happy suggestion in requesting that corners of roofing plates be clipped before coating. My suggestion that they be then edged and packed in boxes, ready for laying, was not intended to cover the whole output of terne plates. Many roofers, I have no doubt, would be pleased to know that plates clipped, coated and then edged, and packed ready for laying "flat-seam" work, were to be had by simply specifying them, instead of the usual flat plates. I predict that some enterprising manufacturer or jobber will offer plates "ready for laying" to those who desire them. All other kinds of "ready roofing" are already offered.

Sheet iron edged and packed, ready to lay, continuous tin roofing, eave troughs, conductor, elbows and cornices, ready made, are at hand; why not have "flat-seam" roofing clipped add edged ready for use also? It is hardly likely that a roofer will clip and edge a lot of plates at "odd times" when the first job that may present itself is one requiring a standing seam.

A large proportion of plates are ordered from jobber or manufacturer after the kind and style of roof are determined upon. The plates are often directed to be shipped direct to the job, and may never see the inside of the roofer's shop, but even if they did, would not "J. L." find it a convenience to buy them ready to lay, if costing no more or perchance less than if he prepared them?

Objections raised on account of lack of uniformity of width of edges turned would seem trifling, as flat-seam folders have so long been in use that the size of the fold has long since been established.

The new quadruple folder will no doubt follow the established order of things. At any rate the plates ordered for any specified roof could be relied upon as to uniformity in width.

The additional expense incurred by increased size of package to hold the sheets edged should be trifling, and the freight charges but little, if any, more. The weight of sheets folded must be the same as if flat, and only an additional weight of wood need be considered in reckoning the freight charges.

Gas Tar For Roof Paint.

From S. & H., *Watsontown, Pa.*—Will you please answer, through *The Metal Worker*, whether or not gas tar is a good paint for a sheet-metal roof?

Note.—This subject has been often discussed in the Letter Box, the latest time in April, 1893. A strong general impression exists that gas tar destroys rather than preserves tin roofs, though some have been brought to notice that have had many coats and are still in good condition. A sufficient number of layers of tar or any other water-proof material will make a rain-proof roof of itself and obviate the need of any other impervious coating. A roof made of fine wire netting might be coated with tar so as to shed water for a time as completely as a new tin roof. But as a preservative of the tin, which is the true purpose of paint or other material, gas tar is not to be recommended.

Safety of Steam Heating Boilers

From J. A. D., *Michigan.*—I find people in this part of the country using horizontal wrought iron or steel tubular boilers in some of the best residences. They are generally placed in the center of the basement in houses of from 40,000 to 80,000 cubic feet of space. I have heard of a church in Indiana and a hotel in Connecticut and also a house that were blown to pieces. Do you think there is any danger from these boilers on account of the ignorant attention they may receive from the servants in a household?

Note—From a practical standpoint we do not think there is any danger in steam heating so far as explosion is concerned. The boilers are built amply strong and every provision is made for preventing accident. Furthermore, the pressure used in ordinary steam heating is so very low that there is a very remote chance of the boiler exploding. We do not recall the instances referred to by our correspondent, but we should advise him not to be worried by such reports. Our correspondent would undoubtedly feel perfectly safe in using a range boiler and water back, and yet we presume there are ten fatal accidents due to the explosion of the water back in cold weather by the stoppage of the circulating pipe to one accident due to the bursting of a steam heating boiler.

Source of Air Supply.

From L. M. W., *Delaware.*—Reading the article on "Furnace Heating and Air Supply," by Oscar Weiderhold in a recent *Metal Worker*, suggests another advantage that might be gained from the use of the fan. The air at the top of a building is pure and free from dust compared with that near the ground. If the shaft or box that carried the air supply to a furnace had its receiving point near the top of the building a less quantity of dust would be taken in. Any possibility of warm air being drawn from the furnace and sent out of doors would be prevented by the action of the fan. The top could be arranged with an ornamental cover to keep out rain and snow and a wire screen used to prevent birds and other things from getting in. The cleaner air supply would obviate the necessity of an air filter made of cheese cloth, as is sometimes used, that not only requires to be frequently changed, but also acts to some extent as an obstruction, particularly when clogged. The odor of "burnt air" would be forgotten, if no dust come in contact with the hot furnace. The housemaid would have less use for the feather duster, and many ornaments and articles of furniture would preserve their freshness for a longer period, to say nothing of the satisfaction of knowing that one was breathing clean air. Whether the electric fan and taking the air supply from a high point can be made practical and satisfactory in use may be easily demonstrated. Even if successful, it does not necessarily follow that the practice will become general, though their use may be occasionally adopted where the advantages are considered sufficient. The purity of the air that is supplied and the constancy with which a good volume is furnished, free from dirt, is a matter worthy of consideration by the heating trades.

Single vs. Double Heating Pipes.

From W. E., *Orange, N. J.*—What benefit is derived from covering the studding with tin in partitions in which furnace pipes are run? There are always a number of places left untinned through which the wood could catch fire if such a thing were possible. Even the shavings which are liable to fall against the heating pipes will not burn. Is not iron lath in furnace work unnecessary?

Note.—For the purpose of securing the ideas of those in the trade regarding the above questions, the letter was handed to two heating engineers, whose answers are given below. We should be pleased to have our readers give their views regarding the questions propounded by our correspondent, as the subjects mentioned are of interest to many. The first answer is as follows:

"When single heating pipes are run through partitions, the exposed studding are covered with tin to protect them from the heat radiated from the heating pipes. If the covering does not come in close contact with the wood, the air space thus formed is an additional protection. It is true the efficiency of the covering would be greatly lessened if openings were left as described by the correspondent, but it is supposed a skilled furnaceman would do his work in such a manner that openings would not be left. If shavings can lie against a heating pipe without burning, it simply goes to show that the pipe in question was not hot enough to ignite the shavings. This would not prove by any means that single pipes could not be heated sufficiently to ignite wood. When pipes are run through partitions the custom with most furnacemen is to make the pipes as safe as possible. On this account the pipes are made double, and in some cases covered with asbestos paper. As wooden lath are liable to come in contact with the sides of heating pipes, as an additional protection some form of iron lath is used, that the danger from fire will be reduced to a minimum. Regarding the danger

from fire when single heating pipes are brought in contact with wood, by the application of heat for a long time to wood, even though the temperature be not much above that of boiling water, wood becomes so baked and charred that it is liable to ignite spontaneously, or burn with great rapidity when fire is accidentally applied. The melting point of tin is given at 442°. If the single partition pipes are heated sufficiently to melt the tin coating, or to cause the surface to turn black, it will be seen that the wood work is exposed to a temperature of 442° or over. It has been stated that wood exposed to a pipe heated to a temperature of 300° for about six months was found to be charred to a depth of ¼ inch, which goes to show that single heating pipes should not be brought in close contact with wood."

The second answer, referred to above, is as follows:

"For some time after furnaces came into use in this country dealers were afraid to run pipes to the second stories of dwellings and other buildings, fearing disastrous consequences in the shape of fires, and it was a long time before the furnaceman dared to consider means of supplying the heat to the upper floors of buildings. Single pipes were first used for the purpose and run up in the corners of rooms and often exposed, though occasionally protected by wall paper or screens. Later single pipes were placed in partitions of buildings, but made very small, and the studs were protected by pieces of tin nailed thereon, virtually forming a double stack; but this method proved unworkmanlike and also expensive and at a later date wire lath or metal lath came into use and was placed on studding between which hot-air pipes ran. Another step in the advancement of the work came when asbestos paper was manufactured and dealers began gradually to wrap the single pipes with asbestos paper. This was a long step in advance, but was not perfection by any means, for the reason that it was found frequently that the rats and mice gnawed off the asbestos paper, leaving bare the stack and thus facilitating the radiation of heat. Finally came the double stack, or one stack within another with an air space between, reducing the danger (if indeed there was any danger) from fire to the minimum, and furnishing an economical and satisfactory pipe for the conducting of hot air from the furnace to upper rooms. In actual use it has been discovered that a double hot-air pipe will convey a very much larger percentage of heat than will the single pipe wrapped with asbestos paper or protected by wire lath, and as now made by machinery the double pipe is furnished to the trade by the leading makers of furnace fittings at a lower cost than the single pipe alone could have been produced a few years since.

"One advantage that is evident in the case of double pipes is that there is an absolute freedom from danger from fire. No cases are on record where a double pipe properly put in has caused a fire directly in the building; but it is true that a single pipe radiates a large amount of heat into the partition walls and dries the wall to such an extent that in case of any fire in a building this dried-out partition quickly spreads the flame and adds to the fury of the conflagration. Inasmuch as fires in houses frequently originate in the basement, where shavings, oil or rubbish are found, it often happens that the fire finds ready access to the partitions in which the hot-air pipes run, and these partitions are converted into so many flues for the spread of the flames.

"The amount of heat conducted by the double stack is fully one-fourth greater than that conducted by a single stack of the same size, showing the excess of radiation from the single stack. While wrapping such stacks with asbestos paper, either single or double thickness, reduces this radiation, it has been found that no matter how well wrapped with such paper, there is still an appreciable loss of heat from the single stack. The only merit that can be claimed for the single stack is that space is saved and a larger stack can be used for the same partition, but this is a fancied advantage only for the reason that the larger stack will not conduct any more heat than will the smaller stack, owing to the reasons set forth above. The custom of covering the studding in which hot-air pipes run with metal lath is fast going out of use, owing to the fact that the cost is much greater than where double stacking is used and with no attendant advantage, and in many smaller places it is difficult to procure such lath of suitable width, and loss is the result where this work has to be done."

Question in Plumbing.

From C. E., *New York.*—I want some advice on a plumbing job that I am called upon to do. A customer, without consulting me, had built a brick vault under his kitchen to receive deposits from soil pipe, one side of the vault having a large inlet for the water to run in and through it, and a 6-inch tile at the other side connecting with a water sluice way. He intended to leave the vault open at the top, but I told him if he insists upon using it he must close the top of the vault. I propose to dispense with the vault altogether and use simply a soil pipe with a running trap in the ground and an inlet at the elbow at the foot of the perpendicular soil pipe.

Answer.—Our correspondent incloses a rough sketch, from which it appears that a supply of water from a pond is running continually through the vault, carrying the soil out through a drain into the water sluiceway. The reason for the vault we fail to understand, and agree with our correspondent that it would be wiser to run a continuous pipe to the sluice, connecting at the elbow to another pipe from the pond, which would keep the main drain constantly flushed. The objection to the vault would be the same as to the old-fashioned traps, which were of such large capacity that they never were properly cleansed or flushed, but remained veritable cesspools in the plumbing system.

Wants a Rule for Finding Capacity of Furnaces.

From H. W. K., *Jacksonville, Ill.*—Will you give in the *Metal Worker* a rule for finding the capacity of hot-air furnaces? If you could give the rule used by the manufacturers I would be obliged. I have received a great deal of valuable information on furnace work, but have looked in vain for such a rule.

Note.—We know of no such rule, but can appreciate how valuable it would be to furnacemen. No doubt one rule would not apply to all constructions, and much difficulty would be met in formulating rules that would, but this should not prevent the progressive furnacemen from making the attempt. Impressions and experience tending to such an end could be exchanged with advantage in the Letter Box.

Method of Connecting Boilers.

From W. N. S., *Ansonia, Conn.*—I would like to know if there is any objection to connecting up a boiler by taking the hot-water pipe from the water back to the top of the boiler, and connecting it there by a T-joint? I know that it is not the general way, but is there anything about it that will hinder it from working? Hot water would come much quicker and direct from the water back, and I can see no reason why the boiler would not heat as well as by the old plan of connecting at the side.

Note.—This method of connecting a boiler is not new and has been tested with satisfaction by many. One plumber used a trap having a drop of 2 feet in the upper pipe connected in this way, to demonstrate to a skeptical friend that it would not hinder circulation or heating. Some difference of opinion exists on this subject, which was discussed in *The Metal Worker* in the spring.

Heating Coil Outside of Fire Pot.

From J. R., *Chambersburg, Pa.*—Will the readers of *The Metal Worker* give their experience and opinion whether a coil of pipe put around the outside of the fire pot of a brick-set hot-air furnace will heat the water enough to warm a room by means of a radiator? The cold air that comes to supply the furnace would play right on the coil. Whether such an arrangement would be successful is something I cannot tell, and I thought that if anybody had tried such a plan I would like to know of it, for I never heard of anything of the kind.

According to a recent report of the Paris Gas Company, the consumption of gas in Paris during the year 1892 was 3,500,000 meters less than in 1891. The decrease is wholly in the night service, the day consumption for cooking, gas motors, &c., showing an increase to 27 per cent. of the total consumption. The increasing use of the electric light is given as the cause of the falling off in the volume of gas used for illuminating purposes.

PLUMBING and GAS FITTING.

The Chicago Master Plumbers.

The Chicago master plumbers held their regular meeting Monday evening, September 11, at their hall, 197 Madison street, President T. P. Culloton in the chair. There was a large and enthusiastic gathering of the members, many of whom had returned from their vacations and were consequently filled with renewed vigor and old-time energy. Considerable discussion was indulged in regarding the methods of testing house drainage and ventilating pipes. Attention was called to the fact that while iron soil and waste pipes and their connecting ventilating pipes might be made perfect and able to withstand the tests applied to them, a building could not be considered to be in a good sanitary condition when tile sewerage pipes were used within its confines. Considering the reports regarding cholera, it was recommended that the sewerage and catch basins connected with each building should be put in the best condition possible.

Trap Ventilation.

We have the following communication from M. W. Hopkins, B.A.Sc., C.E., resident engineer to the Hamilton Sanitary Association, at Hamilton, Ontario, and who was formerly assistant engineer to the Montreal Sanitary Association:

The articles on "Trap Ventilation," by Mr. Glenn Brown, F.A.I.A., and Mr. Wm. Paul Gerhard, who seem to differ somewhat on the advantage of back vents for traps, have been very interesting for two reasons: First, because of the knowledge we acquire in reading them, and second, because it shows us that high authorities can differ on vital points. The question is a very important one because, as Mr. Gerhard says, it costs money to ventilate traps when they are scattered throughout the house. If, however, it is necessary, we should not allow this cost to deter us from doing it. If it is not necessary, there is money saved.

In writing reports on the sanitary arrangements of old buildings this feeling has come very strongly to me. There are many cases where it bothers me to decide whether to recommend a vent pipe to be taken from the trap or not. My conscience will be pricked whichever I do. If I do, it will cost the owner considerable money. If I do not, I perhaps haven't done my duty.

The three objections Mr. Gerhard gives in *The Metal Worker* of September 2 seem to me not to have so much force as would at first appear His first objection only applies to old buildings and very high buildings. Now, if it is good in a new building, it is good in an old building, the only objection being in the cost. Of course, if the cost is prohibitive it must be done without, on the same principle that a poor man would rather submit to having the air he breathes seasoned somewhat with sewer gas than pay to be free from it; or he would rather live on mush and milk than pay for roast beef, &c., although he would willingly admit that the latter was better.

Then we will all agree that there will be a certain hight of houses that will prevent vent pipes going separately through the roof or joined into the soil pipe above the highest waste connection; also we will admit that we can easily picture to ourselves old houses with fixtures scattered throughout where a man of ordinary means would rather do without trap ventilation than pay for it, or we may conclude that a poor man would generally willingly do without trap ventilation in such cases. But then we have to consider that poor men do not have fixtures scattered throughout the house, nor do they build very high houses, and then for the highest houses in New York or any other city the separate ventilating pipe passing up through the roof need not be so very large, and if this vertical pipe received no waste connections, the vent pipes from each story could be joined directly into it, and the expense would not be so very great. Again, large houses are usually inhabited by wealthy men who can afford surely to have the sanitary arrangements of their houses perfect if they can afford to drink champagne and keep an army of servants. Then it would seem that if it is better to have trap ventilation the cost should not prevent its use. Poor men generally have only a few fixtures and those close up to the soil pipe and only on one flat, so that the trap vent can be joined into the soil pipe just above the fixture.

Also the objection to having trap ventilation in old houses with fixtures scattered throughout holds if there is no trap ventilation, for then there are long dead ends, which Mr. Gerhard objects to, and water closets would have to be ventilated any way in such case. So such buildings should have trap ventilation, according to the above authority. Then this objection will hold for high buildings also, unless the fixtures are grouped close around the soil pipe or waste pipe, as the case may be. If that is the case it would not cost much to run a separate ventilating pipe up alongside the soil pipe and join it into it above the highest waste connection.

His objection No. 2, given in *The Metal Worker* of above date—namely, that a vent pipe increases the evaporation in the trap—should not have much weight, for if the fixture is not used all summer the trap will become unsealed any way; and if the fixture is not left unused for some such period of absence of the residents the traps, if ventilated, will not unseal, if they have a proper seal to begin with.

As to objection No. 3, it is very rare indeed that the vent pipe becomes stopped up from splashings from the trap, so it would seem to be worthy of little weight.

It seems to me that there is another reason why traps should be ventilated and that is that then the smoke test or other test can easily and thoroughly be applied to the whole system periodically. It is almost impossible to test a long dead end with the smoke test in reasonable time, unless the leak is very large, for the smoke will not go up the pipe if there is no hole at the other end. This is, also, it seems to me, a very strong reason for having an intercepting trap on the main drain. If there is no trap the smoke test will not be of much use and no other test can be applied to the pipes of an old building as thoroughly and well.

This would seem also a very good reason for placing the intercepting trap outside of the foundation wall and not inside, as is recommended in most of the plumbing by-laws of cities. In a great many of the houses I have tested I have found leakages in the drain just where it passes through the foundation wall, caused by settlement of the building or from neglect to make the joints in this part well. Now, if the trap is inside of the wall, when the drains are periodically tested with smoke, &c., these leakages will not be detected. Whereas if the trap is placed outside of the wall and some distance away from it, all the drains in and near the house will be properly tested if there is a proper fresh-air inlet just inside of the trap.

I consider this a thing worthy of much consideration, for I very often find a serious leakage at this point.

Plumbing for a State Normal School.

We are indebted to Richard Horstmann, Sanitary Inspector of Public Schools, New York City, for the following description of some excellent plumbing work, executed under the direction of a recent graduate of the New York Trade School:

Knowing your great interest in everything pertaining to plumbing, I take great pleasure in writing a few lines about some good work I saw on a visit to Pennsylvania. Saturday afternoon, August 12, I started with my family to spend Sunday at Stroudsburg, Monroe County, Pa., near the Delaware Water Gap. While in Stroudsburg I was invited to visit and inspect the new State Normal School, costing $100,000. This being a school building, interested me all the more. The building itself is a stately structure. Of course the plumbing interested me most, and reflects great credit both upon the contractor, George E. Stauffer, and the young man who drew up the specifications, John Ingram, Jr., representative of Louis Waefelaer. The following will probably interest members of the New York Trade School, as he was a graduate of the class of 1887. It appears the school trustees only purchased plans and specifications for carpentry and mason work, and when the building was about completed they decided to have plumbing. Hearing of Mr. Ingram, they invited him to draw up specifications and plan locations of 33 syphon closets, 10 porcelain enameled baths, slop sinks, washstands and slate urinals. I saw a copy of same, and they are first class; nothing extravagant and right to the point. Contract called for completion of job by August 26. It was started July 17, and finished on time, Mr. Ingram having supervision of the job.

To be brief, I will only mention that good judgment was displayed in providing extra lines of vent pipes from the dead ends of the horizontal soil and waste pipes, which are located in the basement, first, second and third floors, thus allowing a full circulation at both ends.

The closets are on one side and the bathtubs and basins on the opposite sides of the rooms. The dead ends of soil pipes connect into a 3-inch and the dead ends of the waste into a 2-inch line on each floor, terminating in attic, where they are connected together with the main risers into an 8-inch pipe, carried through peak of roof. There are two dormitories to the building, one for males and one for females, the arrangements of pipes being alike in both, thus avoiding having a number of pipes coming through the roofs (which in no case are an ornament to a building with a peak roof).

Brass screw ferrules have been inserted on these lines and wherever practical throughout the building for cleaning purposes, in case of stoppages, thus avoiding endless trouble and expense should a stoppage take place, Pipes from leader traps outside of building have been extended to top of ground, with screw ferrules inserted, so that in case of a drought they can be filled with water. In the attics of these dormitories are two 1000-gallon wrought-iron tanks, supplied from street. Then 2-inch fire taps are arranged on each floor, and supply pipes so arranged that all fixtures can be controlled separately by means of stop cocks.

Taking into consideration that the building was about completed, and no allowance made for plumbing, the trustees are to be congratulated upon their choice in selecting Mr. Ingram to take charge and give them such a fine plumbing job.

Chicago Plumbing Regulations.

November 30, 1891, the City Council of Chicago passed an ordinance relating to plumbing, Section 12 of which is as follows : " When required by the Commissioner of Health all work must be tested by such test as this department decides upon, and in the presence of the inspector. Defective pipes must be removed and all defective work made good and conform to this ordinance." In conformity with this ordinance the Department of Health has sent out the following circular to those interested :

" On and after November 1, 1893, Section 12 of the ordinance relating to plumbing and drainage will be enforced in the following manner :

" When the soil, waste, vent, revent and all other pipes (within building) connected or to be connected with sewer are placed in position, they shall be tested by water in the presence of an inspector of this department, and upon completion of building a second test by peppermint shall be applied before work will be accepted by this office.

" Certificates of tests and inspection will be issued by this department. Architects and other interested parties are advised to demand said certificates before acceptance of said plumbing and drainage work."

TRAPS AND VENTS.

THE CATALOGUE of the Glauber Brass Mfg. Company of Cleveland, Ohio, for 1893 is being distributed to the trade. The cover is dark green, with the firm's name and address embossed in silver bronze, and a view of their building on the back. The title page proclaims that they make a specialty of manufacturing high grade brass goods for plumbers, steam fitters and engine builders, and are the sole makers of Glauber's patent stop and waste cocks, basin clamps and hose bands. The introduction states that only the Glauber brass composition is used in their goods, which, with the features of excellence, has created a demand that required increased producing facilities. These they say are found in their new quarters, which are claimed to be among the largest and most complete brass manufacturing plants in the country. Following the introduction are 50 pages of text and illustration showing the adaptation of the Glauber patent to all forms of cocks. Next are noted compression bibbs, basin cocks, unions, &c. Then the Magic basin clamp, made to fit any kind of a bowl, and an adjustable basin clamp are referred to. Next are rubber connections for plumbers' hose couplings, nozzles and Glauber's patent hose bands. These are followed by a variety of steam valves, water gauges whistles, air cocks, gauge cocks, brass and glass oil cups and lubricators. The last page is devoted to the Keystone union, made of iron with a soft metal seat, which can be used for either hot or cold water work and a tight joint made without a perfect alignment of the pipes.

A PLEASANT CALL will be missed by the plumbers who fail to be in when visited by the representative of the Glauber Brass Mfg. Company, Cleveland, Ohio. A. M. Buchmann is now in the West, and J. H. Glauber in the East, for the purpose of explaining the merits of their high-grade goods, and their specialties, the Glauber patent stop and waste cocks, basin clamps and hose bands, and other standard brass goods. The 1893 catalogue of the firm is ready for distribution.

CERTIFICATES OF COMPETENCY have been granted to Bailey & Knott, Wm. H. Demarest and H. C. & J. E. Sowle by the Examining and Supervising Board of Plumbers and Plumbing of Gloversville, N. Y.

IT IS SAID that Wm. McCoach, a well known Philadelphia master plumber, has now become a builder.

HARRY ROBBINS of Maplewood, Mass., has transferred his plumbing business to Reagh's Block.

THE WAYS AND MEANS COMMITTEE who are to provide the Buckner Orphans' Home at Dallas, Texas, with the necessary plumbing and heating arrangements free, have added to their list of members Walter Donovan, D. F. Sullivan, John G. Hunter, H. H Jones and F. A. Campbell.

A UNITED STATES PATENT has been granted to Frederick Tyers of Nottingham, England, for an improvement in molds for making plumbers' joints. The invention relates to making branch or T joints for connecting lead or composite pipe or fittings. In carrying out the invention the piping and the end of the branch or fitting are prepared and tinned in the usual manner and placed in a position where they are held by a mold of special construction, formed with a large recess corresponding to the size and shape it is desired to make the joints. The molten metal is then poured into the mold so as to fill the enlargement, which metal when set is securely attached to the piping and branch or fitting, after which the mold may be removed.

THE G. W. DAVIS PLUMBING COMPANY of El Paso, Texas, is one of the largest plumbing houses in the Southwest, and is composed of G. W. Davis, B. T. Davis, his son, and Eugene Murray. G. W. Davis brings to the management of the business 15 years of practical experience and a wide acquaintance with the latest improved materials. They will carry a large and well-assorted stock calculated to execute small and large contracts for their customers and builders with promptness. The company are now engaged in completing one of the finest plumbing jobs in that section, having contracted to provide the fixtures and do the plumbing at the new Twelfth Company Post, Fort Bliss, for $36,000.

HOWARD R. SHEPPARD of the stove manufacturing house of Isaac A. Sheppard & Co., Philadelphia, has taken out a patent on circulating boilers. It is intended for use where the boiler is set horizontally. The connection from the water back can be made at the middle of the boiler, or in another style at one end. In one form it consists of the usual head with a flange to receive the boiler shell, but has two openings on the circumference to receive the pipe connections. A chamber is cast in connection with one of the openings that has an opening near the top of the boiler. When the connections are to be made at the middle of the boiler the casting is a circle with flanges on each end to receive the boiler shell and openings for the pipe connections. With one of these openings a chamber follows the shape of the casting and opens near the top. This is to promote circulation, deliver the hot water at the top of the boiler with little loss of heat, and to reduce the cost of connections.

CERTIFICATES have been issued by the Board of Plumbing Examiners at Los Angeles, Cal., in addition to those already issued, to the following master plumbers : C. H. Wotton, James Burk, L. C. Lowman, W. E. Warden, Ed. Brown, H. Gersen, Thomas M. C. Bradley, Alexander Stewart and William Newell. Journeymens' certificates were issued to O. C. Beach, M. Burns, Alexander Campbell, J. R. Armstrong and Frank Craycroft.

WATSON & PEALE, a firm of Philadelphia plumbers, are giving their attention entirely to custom work, and have no contract work on hand.

NOTICE is issued to the trade under date of September 7 by M. H. Loftus, North Adams, Mass., that he has bought out the interest of his late partner in the plumbing and heating business heretofore conducted under the firm name of the Lucey Plumbing & Heating Company, and will hereafter carry on the business at the old stand, 25 Center street, under the firm name of the Loftus Plumbing & Heating Company.

D. M. KEITH of the Hughes & Keith Plumbing and Chandelier Company, Denver, Col., while on his way East stopped in Chicago to visit the World's Fair and to renew his acquaintance with old-time associates.

F. J. MCCORMICK, a prominent plumber of Dayton, Ohio, has been in Chicago attending the World's Fair.

O. D. PECK, secretary of Peck Bros. & Co., has returned to Chicago from his visit East.

T. B. BUTTERWORTH, secretary of the San Francisco Master Plumbers' Association for the past seven years, called last week at the rooms of the Chicago Master Plumbers.

A NOVELTY in the way of plumbers' pots for lead and solder has been patented by Charles Brush of Newburg, N. Y. The specification points out the waste due to the oxidation of the molten metal, which forms an oxidized layer that has to be removed from time to time. To overcome this difficulty he has designed a melting pot with a floating seal, composed of metal or other suitable material. This is slightly smaller than the inside diameter of the pot, and is concave on the upper side, with a hole through the middle. By pushing down the seal with the ladle the metal rises into the hollow, and a ladleful can be taken out. On removing the ladle the seal rises and cuts off the air from the melted metal.

STEAM AND HOT WATER.

The Eureka Automatic Radiator Relief Valve.

The accompanying illustrations show sectional views of the Eureka relief valve for steam or hot-water radiators, manufactured by Hodge Brothers, 15 Chardon street, Boston, Mass. The valve is made in two styles, Fig. 1, with bottom inlet, for coil, indirect radiators, steam traps, &c., and Fig. 2, with side inlet, for radiators. The valves are made of cast brass, the shells screwing on to the base, which has a lead seat,

The Eureka Automatic Radiator Relief Valve.—Fig. 1.—Valve with Bottom Inlet.

there being no soldered joints. The cap screws on and can be set up with pliers so no one can get to the adjustments to tamper with them. The float is hollow and closed, so that it rises at the least water, and as the valve stem is attached to the top of the valve, it closes when the water approaches. The expansion tube is made of hard rubber.

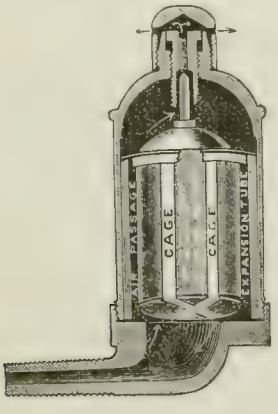

Fig. 2.—Valve with Side Inlet.

The cage which holds the float is suspended from the top of the cylinder and as soon as the heat reaches the valve closes the same by expansion from the escape of steam, so it is pointed out there is never any leakage of water or escape of steam, the valves being automatic in their work. They are tested at the factory to 100 pounds pressure and adjusted to close by heat as soon as it reaches the valve and against the leakage of water as soon as it reaches the float. The valves are adapted for use on either steam or hot-water systems or the combination of both. By their use the air is permitted to escape as soon as the pressure is turned on, so that instant circulation is the result and no noise is occasioned in the heating system. The bottom of the cage being larger than the float prevents the inrush of air or steam from striking the float to raise it by pressure.

The Wm. H. Page Boiler Co.

of Norwich, Conn., are now prepared to show to the trade a full line of their steam and hot-water boilers at 484 Pearl street, New York. The windows are lettered in white, calling attention to steam and hot-water heating apparatus, and display a No. 1 Volunteer hot-water boiler and an array of radiators. On the sample floors the Volunteer steam and hot-water boilers are arranged on the right and the All Right line on the left. A feature claimed for these goods, particularly the Volunteer, is the ease and quickness with which they can be erected and the few joints required. Special attention is called to the superior fitting of the draft and feed doors. All are provided with their patent regulating device which was found to give excellent results during the past winter. The fire-pot section of the volunteer is made with projecting pins which are said to prevent ashes from collecting against this surface, to promote combustion and absorb heat more freely. Quite a strong point is made of this feature. Another practice followed with the Volunteer steam boiler is to tap one of the water sections and heat a radiator that is below the water level in the boiler with hot water. This they say is done with universally satisfactory results when the radiator and all of the piping is below the boiler water line. A new size of the Volunteer is the No. 12, which has a 36-inch fire pot and is expected to develop a capacity equal to their large sectional boilers.

The waterways and flue spaces are ingeniously contrived to promote circulation and to realize the heat from the products of combustion, while they have free passage to the chimney. The same care has attended the development of the All Right boilers, which are made for setting in brick. One of their features is the oval fire-pot section and crown, which is all cast in one piece, and quite a skillful bit of foundry work, in addition to many advantages from a heating standpoint and freedom from joints. The Volunteer boiler, for hot water, is made in seven sizes, to supply from 200 to 1200 feet of radiating surface. For steam the smallest size is omitted. The All Right boilers for hot water are made in four sizes with fire pot of same diameter in inches as their numbers, which are respectively 18, 21, 25 and 30. They are rated to supply from 300 to 1500 square feet of surface. For steam boilers are of the same numbers and dimensions.

HEATING NOTES.

President Bond of the American Radiator Company, Chicago, has been making a visit to the Boston and New York offices.

L. J. Libby, who for a number of years past has sold the Spence boiler on the road in New England, has severed his connection with the American Boiler Company and accepted a position with the well-known firm of Olds & Whipple, Hartford, Conn., to take charge of their heating and ventilating department.

The United States Heater Company, Detroit, Mich., continue their enterprising system of advertising circulars, the last issue of their Postal Traveler announcing that they have not left the road, but have been busy during the late financial disturbance in bringing out a new boiler which they offer the trade under the name of the Hecla steam boiler, and which they describe as a modification of the well known Capitol hot-water heater. The same front and back are used, and the same grate and ash pit. The differences are the steam gauge and other trimmings which are not used on the hot-water heater. The interior water sections, however, have been changed to adapt them for steam. The middle waterway of the Capitol has been increased in depth in the Hecla so as to give increased steam and water space, and in order to make ample allowance for the fluctuation of the water line. The most notable change in the Capitol, however, is the enlargement of the water leg and the outermost water tube, of which it is a continuation. There has likewise been introduced into this outer water space a diaphragm for the purpose of providing for circulation in each section. Another feature of the Hecla is the slightly funnel shaped form which is given to the vertical water tubes, and which permits every globule of steam, as fast as it is formed, to rise unimpeded so that there is a constant and uniform movement of steam upward from the heating surface to the steam chamber.

American Radiator Company, 92 Centre street, have just shipped two carloads of Perfection hot-water radiators for the United States Treasury Building at Washington.

The Herendeen Mfg. Company, Geneva, N. Y., are distributing as an advertising circular a *fac-simile* of a letter sent them by John Thorpe, chief of floriculture of the World's Columbian Exposition, in which he refers to the excellent results obtained by the four No. 8 Furman steam boilers which are in the greenhouse of the World's Fair, adjacent to the Horticultural Building.

At the Montreal, Canada, Industrial Exhibit, H. McLaren & Co. of Montreal had on exhibition a fine line of Safford radiators made by the Toronto Radiator Mfg. Company of Toronto. Radiators for every possible requirement were included in the display, which was very large and complete An artistic bestowal of coloring enlivened the design of the goods and con

tributed the effect of elegance to the massive impression given by the goods. Another display made by them was composed of bathtubs manufactured by the Steel Clad Bath & Metal Company. From a sanitary standpoint these baths present the advantage of having no wooden casing and a free circulation of air all about them is permitted. Their smooth polished surface added to their attractiveness and resting on massive claw feet of graceful shape and pretty colors they received a full share of the visitors' attention.

A VERY ACCURATE little pocket barometer is received from the Albany Steam Trap Company, Albany, N. Y., which foretells a change of weather and its probable character by the change in the color of six little spots on a white ground on a hard rubber disk. Of more interest to the steam fitter are the circulars which come with it showing the Blessing specialties manufactured by them. The Albany union is claimed to be extra heavy and with "no rubber joint to leak, no rust to stick." The special bucket return steam trap is said to automatically drain the water of condensation from all heating apparatus and return it to the boiler whether the coils are above or below the water level in the boiler. The reduced pressure system of steam heating using Blessing's combined automatic pump and governor to return the water of condensation back into the boiler under pressure is shown in another circular and is of interest to those who are heating buildings with steam from a power plant.

AT A RECENT CONFERENCE between the Boston Master Steam Fitters and Journeymen's Union the following agreement was reached: That master fitters employ only union men, and that the latter will only work for members of the association; that board will be paid for men working out of town, and that all overtime be paid as double time; that apprentices shall serve a term of two years; that there shall be one apprentice to every six journeymen and the establishment of a minimum rate of wages.

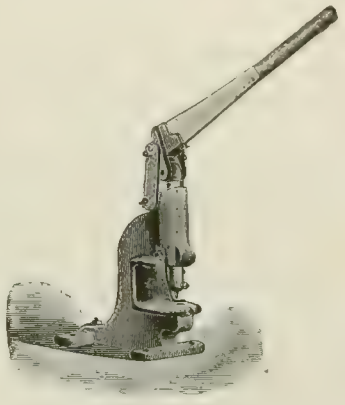
THE catalogue issued by the Toronto Radiator Mfg. Company, Limited, Toronto, Ontario, is a handsome volume, of oblong shape, measuring 10 x 7 inches. The front page is a collection of views of the works and branch warerooms of the company, showing six different buildings located in St. John, Winnipeg, Montreal, Quebec, Victoria and the main works at Toronto. There are also agents in Hamilton and Auckland, New Zealand. This illustrated catalogue, B, published for the season 1893–94, is devoted to Safford hot-water and steam radiators primarily, and also gives attention to other steam specialties and fittings. In a prefatory address to the trade they call attention to their excellent facilities for handling a large trade, and also refer to the merits of the Safford radiator, the simplicity of which is particularly commented upon. It is pointed out that with their patent right and left nipple system they are enabled to connect the loops of their hot-water radiator simultaneously at the top and bottom without the use of bolts, packing or lead. Following this preliminary portion are illustrations with descriptions of the several Safford radiators, beginning with the Favorite pattern. Among later goods are the Daisy pattern, the dining room radiator, Favorite pattern corner radiator, circular radiator and curved radiator. Then the direct-indirect and later notice is made of window radiators and stairway radiators. The Safford Perfect and Provincial complete the list of direct radiators. Indirect radiators are next mentioned, and attention is given to radiator valves and other fittings. Some 20 pages are devoted to half-tone engravings of large buildings in which the Safford goods are employed. Toward the end of the volume is a list of references. Following the list of references is a chapter entitled "Useful Information Pertaining to the System of Heating by Hot Water and Steam," compiled by John Taylor, secretary and general manager for the company. The information here is given in a compact form and will be serviceable to many people in the trade. Several tables in this connection will also prove of interest. Next to this chapter come specification forms, followed by plans of buildings heated by direct and indirect methods, among others being the Bank of Hong Kong and Shanghai, located at Tientsin, China.

C. W. WRIGHT, 96 Lake street, Chicago, general agent for T. C. Joy & Co.'s radiators, is distributing a circular calling attention to special features of this line. The new Crescent window radiator, for steam or hot water, is illustrated. This a low radiator, several rows of loops in depth, so as to secure great power and effectiveness within the smallest space. The Orient is another new radiator, for steam or hot water, 39 inches high, of a very richly ornamented pattern. A series of cuts is also given showing the cross section of the Orient, as compared with cross sections of loops by other makers of radiators. In printing the cuts red ink is used to show the unobstructed radiating surface and black ink the obstructed radiating surface. According to these cuts the Orient shows a remarkably small obstructed surface. It also contains hot-air flues between the loops for the purpose of increasing the circulation of hot air and thus adding to the heating power of the radiator.

A VALUABLE CATALOGUE is issued by the Nason Mfg. Company, 71 Beekman street, New York, under recent date. The outside appearance is attractive, being bound in dark bronzed cardboard, with the company's name and a radiator in tasteful scrolling embossed on the front cover, with a representation of the Equator heater on the back cover. The goods included cover a wide variety, among them being wrought and cast iron pipe, brass and iron valves and fittings, and general supplies for steam, gas, air, ammonia and oil, steam and gas fitters' and plumbers' tools and supplies, and steam and hot-water heating specialties. All the goods are illustrated, and very complete tables are given of prices, sizes and other essential particulars. Fittings of all sorts are noted, and there is a full assortment of specialties in the lines mentioned. At the close of the book more particular attention is given to the Equator and Gulf Stream boilers of their manufacture, with which the trade are familiar, and also to their radiators and other heating specialties. Pages 193 to 226 are particularly valuable to the steam and hot-water heating trade, as they contain much practical information on those systems of heating. The information presented is compiled by the Nason Mfg. Company from various well-known authorities. Altogether, the book is a very comprehensive publication, and will be appreciated by the trade.

Hand Lever Punch.

The accompanying illustration shows a new hand-lever punch that is being put on the market by R. M. Clough of Tolland, Conn. The principal features of this new punch are that it is bolted to the top of the bench and is operated by a lever which can be used either on top or in front. The lever is connected to a toggle and links, which, swinging over the center, makes a powerful punch. The links are so placed as to punch in



Hand Lever Punch.

direct line to the spindle or slide, this construction, it is pointed out, reducing the friction to a minimum.

Prize Competitions.

Prize Competition No. 27 (Reopened).

Local Associations of Merchants.

This competition closed July 8, but in view of the exceptionally few replies which have been received from the trade and the importance and practical nature of the subject, we have reopened it, and extend the time up to which responses will be accepted to September 16.

Some points in regard to the subject appeared in the announcement concerning the competition in our issue of August 24, and will probably be of service to those who are intending to compete.

The committee to whom the papers in Competition No. 25 were referred have awarded the prizes as follows:

First prize to J. E. JANSSEN.
Second prize to A. Q. CASSELBERRY.
Third prize to J. P. HUMES.

In a recent special trade edition, dealing with the most prominent industrial and commercial establishments of New Orleans, La., the *Times-Democrat* of that city makes extended and interesting mention of the Morris McGraw Company, Limited, of 45 and 47 Tchoupitoulas street, where the company have a large six-story structure. The business of the concern embraces wooden, willow, glass and tin ware, cordage, and general house-furnishing goods of all kinds, and their operations extend, it is said, over a wide territory, including Louisiana and the Southern States. They are agents for a number of Northern and Western manufacturers, and also manufacture some lines of goods themselves. Special mention is made of Morris McGraw, president, and John McGraw, treasurer and general manager, as progressive and able business men.

TIN PLATES.

Tin Tea Chests.

A new opening for the tin-plate trade is suggested by the *Iron and Coal Trades Review* of London, in the field of packing chests for tea. According to the report of the British Commissioners of Customs, just issued, the displacement of China tea by tea of East Indian growth is yearly becoming more pronounced, the use of the latter in the United Kingdom having risen in 1892 by 22,500,000 pounds, while that of Chinese and Japanese origin has fallen by 17,900,000 pounds. These facts, remarks our contemporary, will be read with interest by those tin-plate manufacturers who, in seeking new fields in which to place the sale of their productions, have conceived the possibility of supplanting the ungainly, lead-lined wooden chests now in use by stronger, lighter and more durable boxes made of tin plate. The tea boxes at present in use both in India and in Ceylon have to be imported from China, there being no timber free from taint, uniform in weight, and otherwise suitable for the purpose in the East Indies. The children of the Celestial Empire are fully aware of this; they know also that the development of the Indian trade can only proceed at the expense of their own, and they, therefore, make the planters pay heavily for the chests they require.

Recent Sheet and Tin-Plate Statistics.

The Bureau of Statistics has included in its last monthly report a series of statistics relating to imports of sheet iron and steel. No comment or explanation accompanies the tables. We print below the imports of iron and steel sheets for consumption:

Sheets of Iron or Steel, Common or Black, Including Iron or Steel Known as Common or Black Taggers' Iron or Steel, and Skelp Iron or Steel, Valued at 3 Cents Per Pound or Less. (Duty, 1.4 Cents Per Pound).

[Thinner than No. 25 wire gauge.]

*Estimated at three and one-half times last quarter's production.

The first table evidently represents the expectations of producers early in 1892 and the realization thereof a year later. It is quite clear that an estimate based upon three and a half times the product of the last quarterly return is eminently safe from the standpoint of the compiler, but the fact is ignored that some of the mills only began work during the period which forms the basis of the compilation, and that the latter is, therefore, very inadequate and looks unfair.

SCRAP.

THE DEADWOOD, S. D., *Times* says in a recent issue: It is definitely ascertained that the discovery made by Noah Siever some weeks ago on Bare Butte Creek, near Galena, carries tin in sufficient quantities to warrant further development work. An open cut has been made on the side hill 15 feet in length and a 12-foot face, showing the vein to be in place and 3 feet wide, the apex of the vein being 9 feet below the surface. The ledge has been traced westerly to Ruby Gulch, about a mile distant.

DURING the week ending September 9 all of the works owned by the Falcon Iron & Nail Company, Niles, Ohio, were in operation. They comprise seven light sheet mills, two tin mills and one skelp mill, together with sufficient puddling, scrapping and bar rolling capacity to furnish material for the mills mentioned. The galvanizing shop, containing two pots, was also in operation. Fully 750 men were employed. There is no certainty in regard to a continuance.

THE CUMBERLAND STEEL & TIN PLATE COMPANY, Cumberland, Md., are now running their mill to its full capacity after a shut down of ten days for necessary repairs.

MERCHANT & Co., Philadelphia, are offering to the trade American continuous roofing plates manufactured by the American Tin Plate Machine & Mfg. Company according to the Buckman process, which was described in *The Metal Worker* some time ago. The chief feature of the process is the production of a continuous sheet of terne plate, the machine cleaning, coating and joining the sheets automatically. This roofing plate is made and sold in rolls 60 feet long and 20 inches wide, containing 100 square feet. The rolls when ready for shipment are in convenient shape, being in the form of a cylinder about 10 inches in diameter and 20 inches long. An inspection of the sheet shows that the coating has been evenly distributed, and is without break or spot. Apparently a good deal of tin is used in the mixture, giving a bright look to the plate, and the coating is of even thickness down to the extreme edge. The convenience of having the tin furnished in a long strip will be appreciated by the roofing trade. It should be further observed that the sides of the strip are absolutely straight and parallel, which is sometimes a difficult result to accomplish in joining ordinary sheets in the shop if they do not happen to be accurately squared. If the rolls were crated or incased in some way so as to protect the outer layer from scratches and other marring during transit, the improved appearance would be worth the outlay.

BRITISH TRADE returns for August show a material falling off in the exports of tin plates to the United States during that month. The quantity was 15,000 tons, againt 24,000 tons sent over in August, 1892.

BY LATEST ACCOUNTS no less than 29 Welsh tin-plate works were shut down, ostensibly on account of the coal strike. It is reported, however, that in most cases the real reason was a dearth of orders and current market prices being lower than the cost of manufacture.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

A NEW heating apparatus of the most approved modern character will soon be installed in the Washington House at Williamstown, N. J, so says the landlord.

CONTRACT amounting to $1800 has been awarded to the Holyoke Steam & Gas Pipe Company of Holyoke, Mass., for installing the boiler and steam heating plant, including a new chimney, in a school building at Windsor Locks, Conn., under the supervision of J. M. Allen of Hartford, who made the plans.

A NEW heating and ventilating plant has been installed by the Exeter Machine Works of Exeter, N. H., in the Dunbar Street School at Abingdon, Mass.

THE Board of Supervisors of Milwaukee County, Wis., have been notified by Superintendent Fred. Wetenkamp of the urgent necessity of repairing the boiler and steam heating apparatus in the almshouse.

EDWARD FLINN is superintending the plumbing work in the town hall at Fairhaven, Mass., and keeps six men busy. There are twelve water closets, sixteen washbowls, three soapstone sinks and one copper bath for the janitor's family. Hot and cold water will be furnished to all of the bowls, which are set with marble slabs, supported by nickel-plated legs. All the water closets, washbowls, brass pipes for hot water, soapstone sinks and main supplies are in and the large water tanks are lined with copper. A water back will complete the kitchen, and about three weeks' more work by the plumbers will complete the job.

THE CARMAN THOMPSON COMPANY, Lewiston, Maine, have filled a $1000 contract by putting a new steam heating plant in the school building at Canton.

THE trustees of the Levings Methodist Church, at South Troy, N. Y, have decided to put a new heater in the parsonage.

CITY ARCHITECT WHEELRIGHT of Boston awarded the contract for plumbing the new hospital for contagious diseases to Henry Hussey & Co. for $10,000.

T. J. KINNEY put in the plumbing fixtures at the Dunbar School at Abingdon, Mass., and the closets are said to be models of neatness.

THE THEO. JACOBS COMPANY, 72 and 74 Market street, Chicago, are to furnish two 48-inch by 14 feet horizontal tubular boilers, feed pumps, surge tank, hot-water heating tank, and all the paraphernalia connected with a first-class heating plant, for the Carolina Hotel, Rush and Indiana streets. American radiators will be used for the 8000 feet of radiation required.

THE FARQUHAR HEATING COMPANY of 58 Dearborn street, Chicago, and 217 West Locust street, Des Moines, Iowa, have, among others, the following contracts for heating: Hubbard, Iowa, combination of hot water and warm air in school house; Mason City, Iowa, combination of hot water and warm air in residences of Geo. E. Winter and Wm. Hoy; Sigourney, Iowa, circulating tube water heater for store building of C. B. Dobie; Forest City, Iowa, combination of hot water and warm air in residence of E. Secor; Mason City, Iowa, two low-down surface burners for Christian Church; Polk City, Iowa, two large Panama warm-air heaters in school house; Groundy Center, Iowa, circulating tube water heater in residence of A. F. Willoughby; Blue Island, Ill., circulating tube water heater in residence of A. N. Townsend; eight Panama warm-air heaters in row of flat buildings of O. W. Burke; Harvey, Ill., circulating tube water heater in residence of C. A. Carr; Chicago, circulating tube water heater in residence of W. F. Blocks, 1628 Indiana avenue.

JAMES B. CLOW & SON, manufacturers and dealers in supplies for plumbers, railroads and water works, Lake and Franklin streets, Chicago, are to furnish 600 tons of iron pipe, 112 Eddy hydrants and 56 Eddy valves for the water works at Harlem, Ill.

THE J. L MOTT IRON WORKS, 311 and 313 Wabash avenue, Chicago, have lately received orders for Sunray heaters from San Francisco, Cal.; Decatur, Ill.; Clinton, Iowa, and Fort Gratiot, Mich.

COE & MCMILLAN of Monticello, Ill., have lately installed a steam plant in the Talono High School, consisting of a No. 10 Haxtun boiler, with 872 square feet of direct and 516 square feet of indirect radiation. They have also just finished the plumbing in the two flats in Monticello for J. D. Knott, and have the contract for the plumbing in a residence for David White.

AT FAIRFIELD, MAINE, the Odd Fellows are considering the heating of their building with steam and hot water, and the advisability of furnishing heat for adjoining buildings.

HENRY WILLARD has been awarded the contract of putting the heating apparatus in the new house of V. N. Ryan, at Milford, Mass.

MALVEN, GORDON & Co. have the contract for putting a new steam heating apparatus in the German Lutheran Church at Port Jervis, N. Y.

THE RETAIL STORE.

The Wayne Combination Washer.

The washer illustrated in Fig. 1 is made by the Anthony Wayne Mfg.

Fig. 1.—The Wayne Combination Washer.

Company, Fort Wayne, Ind. The machine is referred to as being simple in construction and as having no parts which will get out of order. It is stated that the gear is strong, that the sud box is made of well-selected yellow poplar, well bolted together, and that the bottom consists of a heavy sheet of galvanized iron put on with a packing that makes it absolutely water proof. The standards are of hard wood, all painted and varnished. The machine combines the reciprocal pinwheel motion with an oscillating movement of the whole box. The main advantage, it is claimed, is that the machine works easily, because the water, when the machine is oscillated, is made a factor to help do the work; for as the machine is tilted either to one side or the other, the weight of the water does a large amount of the work. It is explained that the machine has a large capacity, and on account of its oscillating movement it requires a small amount of water, and that it will wash quickly, a continued motion of five minutes doing a large amount of work, as the washer has the double motion of the pinwheel and of the rush of the water through the clothes. When the machine is open and the lid thrown back, as in Fig. 2, the transverse rod to which the rack bar is attached drops into an opening in the side, thereby locking the machine, so that a wringer can be attached on the opposite end without fear of tilting the machine. The hinges are described as being of a unique design of malleable iron, made especially for this machine, and as entirely out of the way, being intended both as hinges and also to strengthen the locking device. The weight of the machine is given as 40 pounds, the point being made that it can be easily handled, besides saving a large amount in freight charges.

Fig. 2.—The Washer Open.

The Economic Steam Cooker.

Illustrations are herewith given in Figs. 1 and 2 of the new Economic steam cooker, manufactured by Rau Mfg. Company, 128 Michigan street, Chicago. The cuts show both the exterior and interior of this utensil. It will be observed that the three compartments for cooking are so arranged as to be entirely surrounded by the hot steam arising from the bottom vessel containing the boiling water. The outer compartment protects all the inner vessels from coming in contact in any degree with cold air. The manufacturers state that this is a very important improvement in their form of cooker, as it utilizes all the steam produced and thus cooks quickly, requiring not only less time, but economizing fuel and delivering the cooked food in better shape. No odor escapes from one compartment into another. It is made in two sizes, and either in tin or full nickel.

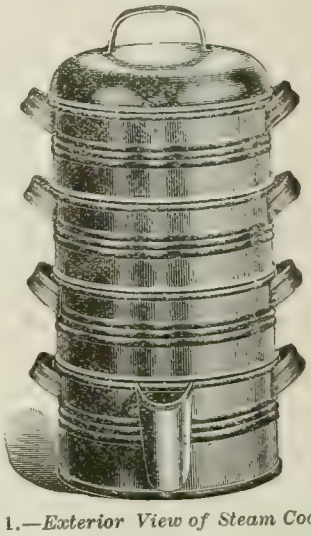

Fig. 1.—Exterior View of Steam Cooker.

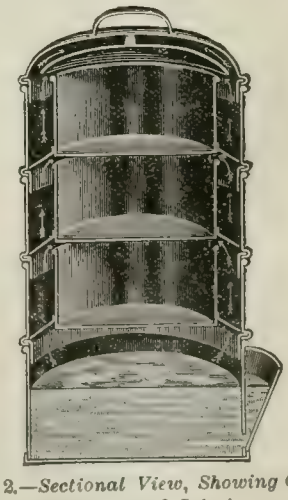

Fig. 2.—Sectional View, Showing Compartments and Interior.

STOVE TRADE NOTES.

The Future of the Hot-Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

HEATING GUARANTEES.

One feature of the furnace business that has caused great trouble and loss to the dealer is the nature of the heating guarantee insisted upon by the architect for his client, or by the owner himself. A contract is frequently taken by a dealer to install a furnace job, and the job is finished in accordance with the plans and specifications, and is accepted by the superintendent of the architect, and the dealer calls for his certificate, that he may make a settlement with the owner.

The architect says: "Give me a written guarantee to heat the building to 75° in all kinds of weather, or remove the furnace and refund two-thirds of the contract price, and I will issue the certificate." When told that the contract contained no provision for so sweeping a guarantee, or, in fact, for any guarantee at all, the architect says that other contractors agreed to give such a guarantee, and unless the dealer does so he will have to wait until the furnace is tested before he gets his pay. After much vigorous protesting the dealer gives the required guarantee, as he cannot afford to be without the money for so long a time, and departs a sadder if not a wiser man.

From that time forward he is tied hand and foot to the owner of the furnace, and no matter how poorly constructed the house, no matter how defective the furnace flue, the dealer must manage to heat the building in accordance with the terms of the guarantee, or suffer the penalty, which would mean a serious financial loss. Many a dealer has been caught in such a predicament and become soured for all time on the furnace business. No man knows, or can know, in advance of construction, the nature or character of a building, and in giving a guarantee must reserve to himself certain exceptions and rights; otherwise he must obtain an exorbitant price in order to insure him for the risk he runs.

I have figured on plans and specifications which were so drawn that if the contractor was obliged to follow them to the letter he might as well make a present of the job to the owner after the work was completed as to give a guarantee on it. A furnace contractor always should give value received on every job, but he knows or should know the limitations under which he must do his work, and that certain forces must be controlled if his work is to produce the best possible results. If the basement is low, and the pipes long, and traversing exposed portions of the basement in order to reach registers located in the wings of an L shaped structure, he must know that he is working against heavy odds, and to guarantee such pipes to heat in "all kinds of weather" would be the greatest possible folly.

In nine cases out of ten the houses to be heated by furnaces can be heated in a manner satisfactory to the owner, but the tenth house may contain obstacles which cannot be overcome, and therefore it behooves the dealer to give guarantees only after a careful study of the conditions under which the furnace must work.

In giving a guarantee of any kind the furnace contractor should have *carte blanche* in the matter of location of all stacks, pipes, registers, cold-air duct and furnace. It would be unjust to ask a man to run a race and then tie his hands and feet; and if furnace contractors are willing to take contracts for heating houses under a guarantee, and then relinquish to others the location of the registers, pipes and heating apparatus, they deserve to get their fingers burnt, and burnt badly.

I know of a case where a furnace contractor guaranteed the amount of fuel his furnace would burn during a certain period and had the pleasure of writing a check for the excess amount of fuel consumed. I know of another case where a contractor guaranteed to heat a hall, the basement of which was sided up with unmatched boards through which the cold penetrated to such an extent that the pipes were chilled and could not deliver heated air in any volume to the auditorium above.

Many dealers will recall painful experiences similar to the above and have learned the lesson of exercising great care in giving guarantees on work. The guarantee is a club in the hands of a dishonest owner, and in many cases it has been used unjustly to both the dealer and the furnace business, and when a guarantee is given it should be so worded as to protect both owner and contractor.

(To be continued.)

Reading Stove Works,

Orr, Painter & Co., proprietors, Reading, Pa., issue a very full and interesting catalogue of stoves and ranges of their manufacture, the publication being for the years 1893 94. The volume is notable on account of its thickness, there being nearly 250 pages in it. The binding of cardboard is tasteful, and the paper is of a fine grade, which renders the typographical appearance very pleasing. In an accompanying circular letter which they address to the trade they direct attention to their several special lines, and more particularly call attention to their Torrid and Torrid Sunshine furnaces, the advantages of which they elaborate. In the prefatory announcement they refer to their excellent facilities for shipping goods, and also make mention of their different branch offices, stating that they have established a branch warehouse in Boston for the accommodation of their growing trade in New England. After the usual preliminary notices concerning terms, &c., the catalogue proper begins with the line of Sunshine ranges, to which over ten pages is devoted. Next follows the Othello, the New Mayflower, other types of the Sunshine range; after which attention is given to cook stoves, the Grand Sunshine, the New Lighthouse, the New Excelsior, Penn, Harmony, Cora and various similar constructions. The Welcome Sunshine is a plain and tastefully decorated coal cook, made both with and without reservoir. At page 110 begin notices of parlor stoves, the Golden Sunshine, Sunshine Square, Merry Sunshine, Parlor Sunshine, Western Sunshine and Bright Sunshine, embracing a variety of very handsome constructions of this sort. A number of round surface and base burners follow, from which the dealer has a wide variety of choice. Wood stoves and Franklins are given suitable attention; also cannon stoves and fire places. Under furnaces, several views are presented of the Torrid Sunshine, and the construction and special features are carefully explained. The Torrid Sunshine combination heater is also noted at some length. The closing pages of the book are of more than ordinary interest for, in addition to hollow ware and miscellaneous goods noted, besides indexes, &c., there is some interesting reading about the operation of stoves, the defects of chimney drafts, &c., while further still is a chapter under the general title of "Selected Information," giving tables and some other matter that will be of not a little service to the dealer.

St. Louis Stove Trade.

The era of depression, so far as the St. Louis stove trade is concerned, seems to have disappeared entirely, and the four local foundries, namely, the Excelsior Mfg. Company, Buck's Stove & Range Company, Western Stove Mfg. Company and Bridge & Beach Mfg. Company, are all enjoying an excellent trade. A visit to these foundries finds their stock in excellent shape and at this writing they are able to fill all orders promptly. During the past week, however, orders have been coming in very fast. Orders received by these four foundries on Monday, 11th inst, will aggregate close to 2000 stoves. It would seem that just now is a propitious time to send in orders, as should the present heavy demand continue, and indications are that it will, the end of September will find the local manufacturers bare of stock. It will be impossible for the traveling representatives of these concerns to see all their trade during the next two or three weeks, and the only way out of the difficulty is for the dealer to send in his order by mail.

The Fuller & Warren Company, Troy, N. Y., through Walter P. Warren, president, issue a notice to their customers, in which they mention that in consequence of the past financial disturbance which may disturb early fall trade and make customers hesitate to place large orders for immediate shipment, they shall endeavor to keep constantly in stock and ready for immediate shipment on receipt of orders a large and assorted supply of their wares. They refer to their large corps of trav-

eling salesmen, but urge that as it is impossible to call on all their customers as frequently as they should desire they request to be favored with orders direct without waiting for the traveling salesmen.

John Van.

The engraved likeness of John Van of the John Van Range Company, which we give herewith, shows the face of one whom the trade long knew and honored. Last week we printed a notice of his death and the more important incidents of his life. He died at the age of 81 years, having lived in Cincinnati half a century. He was born and passed his boyhood in Montreal, but at the age of 20 years he was driven out with a price on his head for participating in the French Revolution. In the business world he is chiefly known for his introduction of the wrought-iron range, which has done so much to revolutionize the modern kitchen apparatus. Mr. Van was twice married, but survived both of his wives. He leaves six children, five sons and one daughter.

H. Rendtorff & Co.

6 Lake street, Chicago, have just issued a supplementary catalogue and price-list of stoves and ranges, consisting of 16 pages in a neat paper cover. The Ideal wrought-steel range is first illustrated. This is characterized as "a medium-price, first-class range which is built upon honor" The door panels, corners and name plate are nickel plated. Flues are asbestos lined throughout. The oven is thoroughly braced and bolted. It is made in six styles and five sizes, for hard coal, soft coal, coke or wood. The Crown Andes base burner, improved for 1893–4, comes next. This stove is designed in the latest style, has a large swell front, high dome, artistic carved nickel sections and extra large solid fire pot, which is easily removed without taking stove apart, and draw center grate or duplex grate with annular shaking ring. Every stove can be used as a single or double heater. Each is made with hot-air ventilating flues, in order to connect by a pipe with room above, thereby utilizing all the heat. Two sizes are made. The Pearl Andes is a new parlor heater, square style, with large mica section, nickel dome, hot-air circulation, double heating attachment if desired, duplex or draw-center grate, and is made in two sizes. The Ideal Oak, A series, has a one piece ash pit and screw-register draft, making the ash-pit section perfectly air tight. The ash pan is very large. It is intended for any kind of fuel and is made in five sizes. The Ideal Oak, B series, has been redressed for this year and is also made in five sizes. A new Todd stove is offered named the Ideal Todd, which is handsomely ornamented, has an automatic damper, reversible pipe collar, automatic inside upper door, patent removable linings and high collar and is made in two sizes. The Ideal oil heater is a finely finished oil stove, with central draft burner, full hot-air flues, mounted on casters, and is furnished either full plated or half plated. The firm also call attention to their line of zinc and crystallized stove boards made in their own factory.

Chicago & Erie Stove Company, Limited.

Erie, Pa., favor us with a catalogue of their goods that contains much to interest those who are concerned in the use and sale of ranges, stoves and furnaces. The present volume includes several specialties that have been added to their line, and also an increased assortment. The first article noted in the catalogue is the Superb Helper, a wrought steel range, the special features of which are patent double acting balanced oven doors, double kicker, asbestos lining, &c. Alluding to the construction of these ranges, they state that there are, by actual count, 957 different parts and pieces in the smallest size made with reservoir, all of which are carefully arranged and fitted by hand. The construction and merits of the many different sizes and styles of the Superb steel ranges are considered at some length, attention likewise being given to their double hotel ranges. The next line taken up is the Patent Quick Helper ranges. These are described as successfully combining many advantages offered by both steel and cast iron ranges. Coming to the regular cast-iron goods, there is offered the Duplex Invincible range, made in various sizes and styles; then the Capital Helper, Perfect Helper, Albert Helper, the Renowned, Fairmount and others follow. Various wood ranges are shown; then attention is given to heating stoves, beginning with the Art Invincible, Brilliant Helper, Duplex Helper, Invincible Helper, Royal Helper and Art Helper. Following these are various cheaper grades of stoves of the plainer sort, cannon stoves, &c., while at the close are illustrated and described the Advance portable furnace and the Chief air heater. The Chicago & Erie Stove Company, Limited, also issue this catalogue from their Chicago house, which is at 171-173 Lake street, that city.

JOHN VAN.

Some New York State Stove Dealers.

The following notes refer to some representative stove dealers at Montgomery and Walden, Orange County, N. Y.

At Montgomery will be found A. N. Wade, who is the successor to D. M. Wade, his brother. His stock includes several varieties, among which may be mentioned the Howe Ventilator, the Radiant Manhattan and others of Eugene Munsell & Co.'s line of goods. The West Shore range is also a leader with him. D. M. Wade, who yet remains about the store, tells many an entertaining story of the good old times when he used to run a tin cart for miles around. There were but few tin shops in that section 41 years ago when he began business. Stoves were also few. There hangs above his desk to-day a large cut in a frame of the old Sheer & Packard cook stove. That stove and one made by the Orange County Furnace at Middletown, and which was called the Orange County Air Tight constituted their line. The parlor heating stoves were yet unheard of.

Brown Brothers are also in business at Montgomery, handling almost exclusively Perry & Co.'s line of Argand stoves and ranges. Burdette, Smith & Co.'s steel ranges occupy a prominent place on their floor. They do a large business among the milk factories nearby in the way of repairing and manufacturing milk cans.

Four miles distant from Montgomery is Walden, a very enterprising town, whose chief industry is the manufacture of cutlery. There also are two very enterprising stove dealers, one of whom, A. K. Wade, is a brother of A. N. Wade of Montgomery. His line of stoves consists of the Howe Ventilator and Perry & Co.'s ranges and stoves. Mr. Wade is known as a hustler in the stove and furnace business and also takes many large roofing contracts. He has recently moved into his new store, just opposite, which he purchased. Probably no dealer in this section has more friends among the traveling men than Mr. Wade. He uses them all well, gives them a hearing, talks considerably about the tariff on tin plates and the condition of the country, and then often gives the traveler an order so that he will not go away skunked, a great remark with him.

Schoonmaker & Williams have a fine store down near the post office. The Andes and Acorn are the leading lines of stoves which occupy their floor. They make a special drive on Acorn ranges. On one side of their store is as complete a stock of Andes goods as can be found anywhere in that section of the

State. Seeds and agricultural implements are also among their extensive line.

The Indianapolis Stove Company,

Indianapolis, Ind., issue a catalogue of the heating goods of their manufacture which will be received with interest. The volume, of convenient size, measures 6 x 8 inches, and is bound in tinted paper. Following an alphabetical index and an announcement to the trade respecting terms and prices, the catalogue proper opens with the Atlantic cook stove for coal or wood, having a four-hole top and with and without bracket reservoir; the Crown, made in three styles; next the Atlas, in a similar number. The Clifton is a stove with four holes and bracket reservoir, the special features being nickel knobs and name plate, pouch feed, shaking and dumping grate and other attachments. The Tremont ranges come next, then the Windsor, in four styles; Charm, Kitchen Queen, the Improved Indianola, Dexter and the Monon. Nearly 29 pages are given up to ranges and cook stoves, after which the catalogue continues with a line of heating stoves made by this firm. We enumerate the names of the goods referred to, which are arranged in the following order: Burr Oak, with and without extension top; Black Oak, with extension top; Columbia Oak, Silva Oak, the Indiana Franklin, Nation cannon, Star cannon, Mars, Express, Carbon, followed by parlor stoves for coal, wood or gas, of which several styles are made. The Avon is a medium price square heater, made for both coal and for wood. A variety of box stoves are noted toward the end. The final pages of the catalogue are devoted to hollow ware and sundries.

ODD PLATES.

ROBERT ROBINSON & SONS 105 Lake street, Chicago, issue an illustrated circular describing the Splendid and Novelty oil heaters, which they are now offering to the trade. The Splendid is made in two sizes. The No. 10 is a small stove, for heating small rooms and offices, and its shipping weight is but 25 pounds. The No. 15 is a large stove, mounted on a roller base, which contains a portable tray, has a tank holding a gallon and its shipping weight is 60 pounds. The Novelty is a new departure in oil heaters. It is similar in appearance to the cheerful open Franklin stove, having a swell front, nickel dome, nickel foot rail, nickel legs, nickel name plate, nickel hood plate, brass mantel rail and plain castings, blacked instead of japanned. The tank holds 6 quarts, and the tank and burner can be taken out through the lower door. It is mounted on three feet, on a roller base with portable tray, and its shipping weight is 70 pounds.

THE MICHIGAN STOVE COMPANY'S wall match box, which they are distributing this season, is handsome enough to be a World's Fair souvenir.

THE STOVE FOUNDRY of Baldwin & Graham, at New Castle, Pa., has started up after an idleness of several weeks. About 200 hands are employed.

REEVES & HORNER of 45 North Second street, Philadelphia, stove dealers, are making a specialty of stove repairs, and their efforts in this direction have proved so successful that they have followed it to an unusual extent. The practice of storing the different pieces of stove repairs in heaps or bins, without regard to order or arrangement, makes it difficult to keep track of stock and causes much confusion in the filling of orders. The firm of Reeves & Horner have adopted a system of their own, which enables them instantly to produce the smallest part of any stove made in Pennsylvania, New Jersey, Delaware, Maryland and Virginia at the present time. Their system has necessitated the use of upward of 8000 separate bins. In connection with this system of keeping stock a register or journal is kept in which are recorded the names of all stoves and furnaces at present known to the trade, and many which have dropped out of the recollection of even their makers. The record is so perfect that every change and addition which has been made in the lines of the different manufacturers has been noted; and the firm claim to be able to supply parts for stoves made over 50 years ago. This register has entailed a vast amount of labor on the part of Mr. Reeves, who has had many years of experience in this line. An idea of the extent of the record may be gained from the fact that it provides for over 64,000 changes of patterns of stoves and heaters, with every piece of repair usually carried in stock.

THE BUSY WHEELS of the stove plant of D. G. Littlefield & Co. of Albany, N. Y., makers of the West Shore range, continue to revolve, and the management report comfortable sales of this popular range.

THE PERRY STOVE COMPANY, Albany, N. Y., are running their large plant, on the island below the city, full, and anticipate a silver lining to the cloudy market in the shape of a good fall trade. They have on hand, to tempt the dealer, a most artistic as well as serviceable line of Argand heating and cooking goods. The World's Argand and the other line of parlors are still favorites, while there is a long list of heaters of various shapes and sizes from which to select.

THE ONLY STOVE MANUFACTURERS who exhibited at the New York and New England fair, recently held in Troy, N. Y., were the Phillips & Clark Stove Company of Geneva, N. Y., and Troy, and the Andes goods were tastefully displayed in a tent and attracted a great deal of attention.

THE HULBERT OIL GAS HEATER COMPANY of St. Louis, Mo., have been chartered, with a capital stock of $10,000, to manufacture gas burners, heaters, &c.

THE WEIR STOVE COMPANY, Waltham, Mass., have shut down temporarily.

THE CHATTANOOGA STOVE COMPANY, Chattanooga, Tenn., are working their plant at its full capacity, and find their shipments compare favorably with those of previous seasons.

THE STOVE WORKS of Lowerman Bros, at Bridgeport, Ala., have started on fall orders, and the firm say that their outlook for a busy season is promising.

GEO. R. PROWSE, 224 St. James street, Montreal, Canada, has at the Industrial Exhibition being held in that city a considerable display of coffee urns, hotel ranges, broilers, plate warmers, carving tables, open heating stoves, refrigerators and water filters.

CHARLES E. COLEMAN, representing Eugene Munsell & Co., New York, has just returned from a season's trip and reports sales in advance of last year, partly due to the fact that he began traveling the latter part of May. Mr. Coleman will now be at the company's office, 218 Water street, New York, until January and will be pleased to meet there his many friends in the trade.

WE ARE INDEBTED to A. Weiskittel & Son, Baltimore, Md., for a batch of blotters carrying an advertisement of the Fire King gas heaters and cookers. The goods include stoves, ranges, water heaters, heating stoves, ovens, &c., and the trade are invited to send for a new catalogue and examine the merits of the goods. Many new patterns of gas heating stoves have just been brought out.

WE HAVE RECEIVED from Dr. Edward Kirk, 1208 Vine street, Philadelphia, a circular relating to his chemical compound, which he recommends for "purifying, softening and reducing wastage in cast iron when melted in a cupola, and fluxing the cupola." He refers to the flux known as Kirk's chemical compound flux, which was used many years ago, and which he discontinued making in 1883, as he found defects existing in its working. Since that time he has been engaged in overcoming the defects, and, according to this circular, has succeeded to so great an extent that he now offers a chemical compound which removes from cast iron the impurities producing a deleterious effect. Along with the circular of the compound is a two-page pamphlet on the cupola furnace that will be of interest to foundrymen.

A SPECIAL CIRCULAR issued by the Chicago & Erie Stove Company relates to the patent Model Helper four-hole steel range with 8 or 9 inch pot holes and oven 18 x 20 inches. An illustration is presented of the apparatus and a general description given. On the back of the circular is a reference to the cast-iron adjustable braces and other features of their ovens.

THE STOVE MANUFACTURERS were represented at the Convention of Boards of Trade and Commercial Organizations, which met in Washington September 12, to urge upon the Senate of the United States the repeal of the Sherman Silver Purchasing act, by D. A. Dangler of Cleveland and J. A. Lansing of Scranton, both of whom were appointed upon a committee to wait upon Senator Voorhees, chairman of the Finance Committee.

THE MILWAUKEE GAS STOVE COMPANY, 15 and 17 Erie street, Milwaukee, Wis., have brought out a small but very pretty catalogue describing their latest productions. Attention is first given to their line of Perfection gas grates. These are designed for mantel settings and are made in two sizes, finished in ebony, antique copper or antique silver, guaranteed to burn all kinds of gas. They are made with an asbestos back for directly radiating heat, but additional heating power is afforded by the circulation of air between the heated surfaces. The chimney connection is a positive flue easily controlled by a damper. The burner and valve are the result of long and very thorough experiments in which all difficulties have been overcome. The design of these grates is artistic in the highest degree. Round gas heaters with asbestos fronts are next shown in three sizes. Then follow round gas heaters with polished copper reflector

fronts, also in three sizes. A square reflector heater and a square asbestos heater are made in one size each, in ebony, nickel or antique copper finish. An illustration is given of the Perfection burner and needle valve as used in the company's gas ranges, and one of the ranges is shown with boiler attached ready for operation. A. R. Sille, 128 Michigan avenue, Chicago, is general agent for these goods.

CHARLES NOBLE & Co. of Philadelphia are in the market this year with a line of goods very little changed since last season. Their Pilot caboose stove now has four round holes instead of two round and two square holes, as formerly; and other stoves have been somewhat improved in their dressings. They are prepared to meet an unusually large demand for their Iron King cook stove, which is said to be exceedingly popular in the South as well as in the North. Their stock of Liberty, Melrose, Sam, Extra, Busy Bee, Wide Awake, National, Sterling and Index ranges, Noble Cook, Elmo, Cotton King, Liberty Cook, Star Queen, Lily, Palmetto, New Dexter and Nine Plate cook stoves, Housekeeper elevated oven kitchen ranges, Beauty brick set ranges, Peerless and Dauntless parlor cooks, Liberty Square and Delta parlors, and Liberty and Liberty Junior sheet-iron heaters is large, as also is their series of self-feeders. The only new stove which they are introducing this season is the Ruth, a handsome cook stove designed to meet the demand for a low-priced article. It has four holes, nickel plate on oven door, is suitable for wood or coal, has 15-inch oven and a fire chamber 18½ inches long.

J. B. STANBROUGH of Owego, N. Y., has a fine display of Stewart ranges and Splendid parlor stoves, made by the Fuller & Warren Company, at the Tioga County Fair. He is now working off the second carload of these goods bought this year, and his experience at fairs heretofore has been that he has sold everything that he had on exhibition.

THE BELLAIRE STOVE COMPANY of Bellaire, Ohio, had a most attractive exhibit at the West Virginia State Fair. It was in charge of Secretary E. H. Rider, and consisted of cooking and heating stoves. The Brilliant Star and Morning Star ranges, the Peerless Star and Morning Star cooks, and the Star Franklin and Model Star parlor heaters were the features of the display.

Squab roasted in plain sight while you wait, irons heated in 3 seconds without fire and water boiled in less time than it takes to tell it without stove or coals are a few of the novel sights at an electrical display in the basement, says the St. Louis *Globe-Democrat*, in describing the wonders of the Electrical Building at the World's Fair. This is one of the favorite resorts of enterprising housekeepers. The electricity does the work with such marvelous speed and without the drawbacks of heat and smoke, that it seems the ideal agent. Many of the visitors seem to be afraid of shocks, but are assured that none are possible.

An exhibition of mining and metallurgical appliances is to be held at Santiago, in Chili, next year, opening March 15. Any information in regard to it can be obtained from Señor Julio Perez Canto, secretary of the Sociedad de Fomento Fabril, Santiago.

Trade Notes.

W. H. BUCKIUS, Canton, Ohio, issues a neat price-list of Tinware which he manufactures and sells, the divisions of the catalogue being as follows: Deep Stamped Ware, Shallow Stamped Ware, Sieves, Spoons, Tinners' Trimmings, Japanned Ware, Pieced Tinware, Granite, Agate, Blue, White and Gray Enameled Ware, Erie Hollow Ware and Miscellaneous Goods. The 64 pages of the catalogue are profusely illustrated and tables of sizes and prices accompany the goods.

THE ADAMS & WESTLAKE COMPANY, 110 Ontario street, Chicago, Ill., are distributing, as a souvenir of their exhibit at the World's Fair, an engraving of a gold-plated Empire brass bedstead. The bedstead is an exquisite piece of work and the reproduction in the engraving is faithfully done.

THE SHEET MILL of Summers Bros. & Co., Struthers, Ohio, has been in operation for several weeks.

THE KEWANEE BOILER COMPANY, Kewanee, Ill., and 96 Lake street, Chicago, are building a battery of 60 inch by 16 feet boilers for the General Electric Company of Peoria, Ill. The same company have just completed 12 boilers, 60 inch by 18 feet, with stacks and breeching, for the Consumer's Oil Company of Waco and Houston, Texas, and Little Rock, Ark.

THE CHATTANOOGA FOUNDRY & PIPE WORKS, at Bridgeport, Ala., are running with 80 hands on orders that will last a year.

THE NIAGARA STAMPING & TOOL COMPANY, Buffalo, N. Y., issue a circular of testimonials respecting the tools and machines of their manufacture for sheet-metal workers. The circular has an attractive appearance due to the interlining with red ink. The letters are from many prominent users, including many stove makers and other well-known firms. They relate to the tools of the company, and all express the highest satisfaction with them. The testimonial letters are signed and dated in all cases.

A NOTICE APPEARS in this issue of an auction sale of 10,000 cases of Gray Enameled Opal Ware and Blue and White Ware, at 12 Murray street, New York, by the Lalance & Grosjean Mfg. Company through E. Bissell, Son & Co. This is, we are advised, the largest offering ever made by the above company.

THE WAGNER MFG. COMPANY, Sidney, Ohio, state, in a circular to the trade, that the fire which destroyed a portion of their factory on September 6 will not interfere with their shipments in the least. Their line of goods includes high-grade Hollow Ware, Sugar Kettles, Mauls, &c.

CLINE MFG COMPANY, 67 West Washington street, Chicago, have just issued a catalogue of their specialties, illustrating and describing a new Tea and Coffee Steeper, Cline's Perfection Roaster and Baker, improved steam Washer, fire-proof Kettle, Turtle Cuspidor, Challenge steam Cooker, rotary Cake Cutter, Pot and Lid Lifter, Steak Pounder and Ice Chopper, Florentine Water Filter, Ideal toothed Bread Knife, steam Cooking Table, ornamental Clocks, Curling Irons, Foot Warmers, &c.

THE WOLFF GAS RADIATOR is the subject of a prominent announcement elsewhere in this issue made by the Wolff Gas Radiator Company, 164 Franklin street, New York City. A large illustration is shown of this device and its constructive features and operation are briefly commented upon.

BERGER BROS. of Philadelphia are calling the attention of architects and roofers to their facilities for supplying their well known Eave-Trough Hangers and Pipe Fasteners. These goods are being used on all classes of buildings and present a very neat appearance. The Hangers are now largely used for outside hanging troughs. The firm are, as usual, well stocked with a general line of roofers' and tinners' supplies and prepared to meet the demands of a heavy fall trade.

THE ROLLING MILLS of the McCullough Iron Company, Northeast, Md., which have been working on reduced time, were put into full operation this week in order to meet increased orders.

Penny-in-the-Slot Gas Meter.

The Liverpool *Mercury* describes the penny-in the-slot gas meter, previously mentioned, which has recently been introduced into that city for the benefit of the poorer class of persons who cannot, ordinarily, afford to use gas. There are now some 9000 of these meters in use in Liverpool, and the system is reported to work with complete success. The meter contains three dials, marked L, S and D, and no sooner has a penny been dropped into the slot than the hand of the "D" dial records it. When 12 pennies have been introduced the dial stands at "0," while the hand of the "S" records that 1 shilling's worth of pennies are in the drawer, and so on until £20 worth of gas is paid for. The hand can only move one way, so that by this invention the householder practically gets an indisputable receipt for the pennies he puts into the slot and the total amount he has paid for his gas. An indicator shows how many feet of gas are in the meter "paid for but unconsumed." When all the gas paid for has been used the flame does not at once go out, but under a new arrangement the meter automatically warns the householder that the supply is nearly exhausted by gradually lowering the flame at least one hour before turning the gas off.

A "nickel-in the-slot" telephone is the latest device, and it is said to be finding a good field of usefulness. One which has recently been placed in a hotel at Wilmington, Del., is thus described: All you are compelled to do is to drop in your nickel, dime, or whatever it may be, and the telephone does the rest. Slots are made for a nickel, dime, a quarter, half dollar and a dollar. When either of the above denominations is dropped in the slot, the telephone rings at the exchange, and then the operator knows how much money has been dropped in the slot and how long and to what point the person is entitled to talk.

The French Minister of Agriculture estimates that nation's wheat crop of the year at about 278,000,000 bushels, being 32,000,000 bushels less than last year. Compared with the estimates of consumption, this leaves a deficit of very nearly 52,000,000 bushels to be supplied to France from foreign sources.

TRADE REPORT.

The Iron Market.

Extraordinary efforts appear to be made by a number of steel works and rolling mills to secure work enough to start, or to get enough to keep running even at a slow rate. Naturally, distant markets are sought, and it appears that Western Pennsylvania is the principal aggressor, while the natural territory of the Eastern Pennsylvania mills is the favorite battle ground. These raids have a very unsettling effect upon values, which are really now only being established after what has amounted to practically two months' suspension of business. While, therefore, the announcements of the partial resumption of work at the mills may be regarded as encouraging so far as the volume of business is concerned, they imply woeful sacrifices so far as prices are concerned. Of course it was well understood that improvement could only develop after the tonnage of orders had reached a comfortable total for the mills, but few believed that the start could possibly be made from a lower range of values than that previously attained.

Pittsburgh openly quotes $19.50 for Billets, and even intimates that slightly lower prices would be accepted as a starter; and now comes the report that the Amalgamated Association has sent out circulars to its lodges to ask authority to propose to the manufacturers a reduction of 10 % in the finishing departments. Practically, if accepted by the manufacturers, this would mean an increased pressure from the Western mills, with their cheap crude material.

From Western markets, notably from Chicago and Cincinnati, come reports of very good sales of Southern Iron, but at very low prices. In New York a 5000-ton block of warrant Iron is being pressed for sale by bankers, and there is soon to be the spectacle of an auction sale of Charcoal Iron. Some of the wreckage is evidently being cleared away, since the chance has come to dispose of stuff at any price.

Pig Iron.—The New York market continues very quiet, and some sales agents observe even that consumers have again withdrawn. Reports of exceptionally low transactions, notably for Southern Iron, are gaining currency. There is now being offered by bankers, who a year ago advanced $6 a ton on Southern warrants, lots of No. 2 and No. 3 Southern Foundry and some Gray Forge aggregating a little over 5000 tons. It is reported also that a considerable block of Charcoal Iron is to be offered at auction in this city at an early date by a bank which had advanced on the Iron. Happenings like these are not likely to encourage confidence among buyers. To this must be added the fact that quite a number of Northern furnaces which formerly made exclusively all ore metal are using increasing quantities of cinder and are cutting prices accordingly. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14 25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

The accumulation of stocks has had a depressing influence on prices in the Philadelphia district, and some large buyers are reported to have been asked to make bids at lower figures than they have ever bought Iron for up to this date. There is a semblance of steadiness, but when any one likely to take a large lot comes along prices begin to soften at once. Carload and 50 to 100 ton lots command something pretty close to quoted rates, but on these terms the market is limited, so that quotations do not stand for much in times like these. All depends on the size and financial strength of the buyer, but in ordinary cases asking prices are about as follows for Philadelphia deliveries, and 20¢ @ 30¢ less at such points as Harrisburg, York, Baltimore, &c.: $13 @ $13 50, delivered, for Plain No. 2, $13.75 @ $14.25 for No. 2x and $14.50 @ $15 for No. 1x.

As yet there has been no improvement in the demand for Pig Iron in Pittsburgh and vicinity, but with increased operations among the mills and Steel plants, there should soon be a better Iron market. While production is lower than at any time since the long Coke strike, it is nevertheless true that stocks are also considerably heavier. Until this condition of affairs is righted by consumption overtaking production and cleaning up these stocks it is not to be expected that prices will show any improvement. The closing of the Rail mills has also knocked a large hole in consumption, and no improvement from this quarter can be expected for some time. In the Mahoning and Shenango valleys the same condition of affairs prevails, nearly all the furnaces having considerable Iron piled up. We quote as follows:

No. 1 Foundry	13 00 @	13.25	cash.
No. 2 Foundry	12.00 @	12.25	"
Charcoal Foundry No. 1	15.00 @	16.00	"
Charcoal Foundry No. 2	14.00 @	15.00	"

Considerably more inquiry is reported from Chicago for Coke Iron. The largest dealers state that the inquiry is better than for any time during the past two months, and in some cases comes from unusual quarters, indicating that consumers are not able to get the Iron they have been in the habit of taking. Thus far actual business has developed to only slight extent from this increased inquiry, although apparently reliable reports are out that two or three heavy transactions have been entirely closed in Southern Coke. Most of these were for Foundry Iron, all for deliveries running over 12 months, and of course all at very low prices. Shipments on contracts are heavier than they were and foundrymen report a better outlook among their customers. The feeling is decidedly better in every direction, but the impression is general that the return of activity will be gradual rather than rapid. Lake Superior Charcoal is still very dull. Prices are about as follows, subject to concessions for prompt cash or on large quantities:

Lake Superior Charcoal	$16.00 @ $16.25
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.50 @ 12.75
Local Scotch	14.00 @ 15.00
Ohio Strong Softeners	15.75 @ 16.25
Southern Silvery, No. 1	@ 14.50
Southern Silvery, No. 2	@ 14.00
Southern Coke, No. 2	12.60 @ 12.85
Southern Coke, No. 3	12.10 @ 12.25
Southern, No. 1, Soft	12.60 @ 12.85
Southern, No. 2, Soft	12.00 @ 12.25
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	@ 18.85
Hocking Valley, No. 1	15 25 @ 15.50
Jackson County Silvery	16.50 @ 17.00

In Southern markets a decided increase is reported in the volume of business in Pig Iron during the week, which is evidently the result of a more confident feeling which pervades the trade and the better condition of the financial situation. Some buyers who have long contemplated taking advantage of the low prices current have bought some round lots of Pig Iron, and the sales in the aggregate were upward of 20,000 tons, mainly of Nos. 2 and 3 Foundry Iron. The sale was partly for spot cash, No. 2 Foundry going at $8.25 and No. 3 Foundry at $7.50, spot cash and for prompt shipment, and 25¢ @ 40¢ ₱ ton more for delivery the remainder of this year and one month into next year, f.o.b. Birmingham. If the demand keeps up there will soon be a scarcity of Iron in the South, for so many of the furnaces are out of blast that stocks are already at a low point. In fact, there is now more competition with the Northern furnaces than there is between the Southern furnaces. Besides the above sales there was rather more than the usual run of orders for carload lots, and there

was a fair run of Eastern orders. There is no movement in Charcoal Iron. Quotations as follows:

Foundry.

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke No. 1	15.00 @ 15.25
Lake Superior Coke No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—There has been a further advance in prices, and, while speculative deals have figured with no prominence, enough Tin has moved out from first hands to strengthen the position here considerably and materially reduce the margin of difference between prices for current month and later deliveries. A week ago November delivery commanded 0.55¢ ℔ lb more than spot stock. At the present time the difference is not over 0.20¢ and the early deliveries seem to be relatively the strongest. There has been a good, healthy consumptive demand, involving nearly, if not quite, as much Tin as usually passes from first hands at this season of the year. At the close of the week prices were up to about 20.20¢ for current month delivery, 20.40¢ for October and 20.50¢ for November and December delivery. Dealers' prices for small lots have been advanced about ¼¢ ℔ lb, and are now generally quoted at Banca Pig 22¢, Straits Pig 21½¢.

Copper.—The condition of the market is practically the same as was outlined in last week's report. New export purchases have been on a smaller scale and the home trade buying makes only a fair showing, but deliveries have cut deeply into surplus stocks, besides taking up a good percentage of current production. Prices are firmer and, upon the whole, rather higher, not only for Ingot, but for furnace material. Several hundred thousand pounds of Lake Superior Ingot have been sold at 9¾¢. That price was subsequently bid and refused. At this writing 9⅞¢ @ 10¢ are the popular quotations. Casting Copper is quoted at 9½¢, and 9½¢ @ 9⅝¢ seem to be the inside figures for common casting stock. A brisker demand from small consumers has been noted during the week, and quite a good amount of retail business has developed. Quotations for small lots remain unchanged, but prices seem inclined to harden, in sympathy with the advance in market price of Ingot Copper.

Sheet Copper.—Better business is reported in the market for Sheet Copper during the past two weeks. A marked increase in small orders, as well as in inquiries, appears to have developed since the easing in the general financial situation has set in. Stocks in retailers' and consumers' hands having for long been unusually small are becoming depleted, and the actual necessities of business have probably caused an augmented demand at the earliest date at which the necessary funds for payment could be procured. Prices for small lots remain the same as previously quoted, but there is no longer any talk of shading them on desirable orders.

Pig Lead.—Limited offering and very fair demand have combined to bring about a further advance in prices. Good-sized lots of Common Domestic have been sold for prompt and near future delivery at from 3.85¢ up to 3.92½¢, and the offering at less than 4¢ is now extremely light. Some lots could have been secured at 3.95¢ from second hands. Consumers are more liberally supplied than they have been for some time past, but all accounts go to show that stocks at producing points are unusually low, and the indications seem favorable for a firm market during the balance of the year. Jobbers' prices for small lots have been generally put up ⅛¢ @ ¼¢ ℔ lb. For American Pig 4 15¢ @ 4 25¢ is now asked, according to size of order. The retail demand is only moderate for the season of the year.

Lead Pipe and Sheets.—A fair business in manufactured goods is reported, but a reaction appears to have set in from the brisk demand which was experienced earlier in the summer, and sales all around fall considerably below the normal volume for the present season, largely owing to the depression in the building trade. No advance in prices on Sheet Lead and Pipes has yet been decided upon by manufacturers, but should the market price of Pig Lead continue to rise it is more than probable that the price-list will be advanced in the near future.

Spelter.—Sales in this quarter have not been equal to those reported last week, but a very fair business has been effected in a quiet way and the market shows quite firm tone. Ordinary Western brands would readily bring 3.77¢ @ 3 80¢ for early delivery. Speculative bids of as high as 3.85¢ @ 3 87½¢ have been made for distant future deliveries. Choice brands are held at the usual premium and have met with rather better sale.

Sheet Zinc.—A dull and perfunctory demand is all that can be said in regard to the market for Sheet Zinc. A revised list, referred to in another column, has been issued by the Matthiessen & Hegeler Zinc Company, which gives the price of Sheet Zinc in 600-lb casks as $4 ℔ 100 lb, and changes are also made in the extras and in the discounts. There is a disposition among dealers to lower the retail prices ¼¢ ℔ lb for small lots.

Tin Plates.—The market continues in much the same condition as was reported last week. There is, if anything, a better feeling and less inclination to weakness in prices, although for spot cash and substantial orders material concessions from popular quotations could probably be still obtained. Except in a few instances of Cokes for canners' use, absolutely nothing is being done in "futures." The market is entirely a spot one, but it has a healthy movement at that. A very fair business has been done during the past week in ordinary Cokes and Charcoal Ternes, and the demand appears to increase. Stocks in dealers' hands are ample, but not excessive. Consumers, however, are not holding any quantities of material, but are purchasing as their needs arise. The consumptive demand for domestic Ternes is reported as quite brisk, and manufacturers of this material are in some cases unable to fill all their recent orders. A London cable of September 13 to *The Iron Age* reports on the English market as follows: Tin Plate market has undergone very little change. Demand has been meager and stocks at Swansea have increased to 261,000 boxes in the face of stoppage of several works. Liverpool quotations are as follows:

IC Charcoal, Alloway grade	12/9 @ 13/3
IC Bessemer Steel, Coke finish	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12/
IC Coke, B V. grade, 14 x 20	11/6 @ 11/9
Charcoal Terne, Dean grade	@ 11/6

Sheet Iron.—The demand for Black Iron shows a little more life, but one or two mills have recently resumed operations, which will further add to the floating stock of material, and probably prevent any advance in price, for which manufacturers may be looking. Prices quoted, although nominally unchanged, might be materially shaded on desirable orders. Galvanized Iron continues in fair demand. As some mills have resumed the production it is thought that supplies will fully equal demand and prevent any probable scarcity. Russia Iron shows little movement, owing to the financial depression, which has prevented consumers investing in what is regarded as a "fancy article." The season's first consignment of Russia has arrived, but it was nearly all taken beforehand, so there is little new stock in the market as yet.

We learn from W. J. Burton & Co., Detroit, Mich., that despite the stringency of money and hard times the sale of the Eastlake metal shingles has not been affected, orders and sales for the present time being in excess of those of last year. They have just supplied Eastlake shingles for roofing a high school and M. E. Church at Springlake, Mich., and have contracts for furnishing the same for two ward schools at Jackson, Mich., besides a number of residences.

Rau Bros, Louisville, Ky., dealers in stoves, tinware and hardware, have been burnt out. The insurance is said to cover the whole of their losses.

Chicago Report.

Scrap —Consumers at a distance are inquiring for Scrap, but are trying to buy at very low prices, so that dealers are still offering country collectors the following rates, delivered in Chicago:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4 00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5 00	....
Cast Borings	3.00	..
Turnings	4 00	...
Horseshoes	8 00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	6 ¢
Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2 1-10¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	2 ¢

Anthracite.—Business is steadily improving, and the movement is now something like it should be at this season. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

THE RAVEN STOVE POLISH COMPANY have removed their Chicago office to Saginaw, E. S., Mich., where their factory is located. They decided on this change in order to better facilitate business. We understand that they are having an exceedingly large trade, and are very actively at work in supplying the demands for their well-known line of goods.

THE WAGNER MFG. COMPANY, Sidney, Ohio, are sending out a circular letter stating that "though a portion of their factory was destroyed by a recent fire their shipments have not been in the least interfered with. Anything that may be needed in high-grade Hollow Ware, Sugar Kettles, Mauls, &c., will be promptly shipped and satisfaction guaranteed."

LALANCE & GROSJEAN MFG. COMPANY, 19 Cliff street, New York, favor us with their supplement No. 2, dated September 1, 1893. The supplement is devoted to Agate Iron Ware, White and Blue Enameled Ware, Retinned Ware, Pieced Tin Ware, Tinners' Stamped Trimmings and Japanned Pieced Ware.

CONDITION OF THE

Hardware Trade.

THE IMPROVEMENT which has been perceptible for the past few weeks still continues, and there is a noticeable increase in inquiries and in business. Most of the mills and factories which have been closed have resumed operations and others which have been working on short time are increasing their output. The improvement in the money market is evidently having its effect both on trade and collections.

With a view to ascertaining the condition of things among the trade throughout the country we have recently addressed inquiries to representative Hardware merchants among our subscribers in every State and Territory in regard to the volume of trade, character of stocks, prospects for business, &c. The replies to these inquiries have brought out a mass of definite and detailed information in regard to business in all sections and the feeling of the trade in reference to the future. In manufacturing communities merchants have evidently felt the financial stringency more severely than in other sections, and the silver States also report business as very dull. Taking the country as a whole, it appears, however, that many merchants have found trade nearly as good as in previous years. In many sections business was excellent in the spring, but July and August are generally referred to as having been exceptionally dull. In some States, however, business was fair during these months, notwithstanding the financial disturbance. Our correspondents report a general improvement as fall approaches, though merchants are cautious in buying and credits are scrutinized closely by jobbers and manufacturers. A gradual improvement in business is generally anticipated and on a more conservative and healthy basis than heretofore. Comparatively few merchants anticipate the usual volume of business during the remainder of the year.

STOCKS.

A very conservative policy is evidently pursued by the retailers in regard to the stocks of goods which they carry. As a rule stocks are considerably smaller than at this season, and a hand-to-mouth buying is generally pursued. Spring purchases were generally large, but stocks have been cut down as much as possible during this summer, the aim of the merchants being to carry as small an assortment as will meet the requirements of their trade.

PRICES.

Our correspondents report that while a few manufacturers are offering inducements for stock orders in the way of special discounts, the majority prefer to close their factories rather than cut prices, and jobbers also, as a rule, have refrained from urging purchasers. Merchants in many sections having been obliged to ask for extra time and extension, have not been in a position to either purchase largely or to endeavor to obtain lower prices.

COLLECTIONS.

Collections are very generally referred to as having been hard to make, but money appears to be easier during the past two or three weeks. The financial condition, as is well known, being the great obstacle to business, the lack of money which has prevailed and the distrust which has existed have had the effect of largely curtailing trade. Many of our correspondents, however, refer to collections as having been fair, but some of them allude to a disposition on the part of their customers to make the financial disturbance an excuse for deferring payments which it was in their power to make.

PROSPECTS FOR BUILDING.

The general impression is that after the buildings now in course of construction are completed little or no new work will be undertaken. A large amount of building was commenced in the spring, especially in the South, but fall work in nearly all sections of the country will be light on account of the financial stringency. Architects are not planning much new work and building is practically at an end for the year. In some sections work begun in the spring was abandoned in the summer for an indefinite time.

AGRICULTURAL CONDITIONS.

Owing to unfavorable conditions the crops of wheat, corn and other grains are below the average in most sections. There are, however, exceptions, and some States report excellent crops. The fruit crop has been good and has brought fair prices. The hay crop also, in some States, is large and the marketing of it will put a good deal of money into circulation. While prices for farm products are low, farmers are frequently referred to as in comfortable circumstances, owing to the good crops and good prices during the past two or three seasons. Many of them are referred to by our correspondents as disposed to hold their crops for better prices and as able to do so, as they are not encumbered with liens and mortgages. The effect of this will be to make money scarce with them and curtail their purchases to a considerable extent. Crops will, however, in many cases be marketed without unusual delay, and this will, it is expected, benefit business, as the money finds its way into trade circles.

PROSPECTS OF TRADE.

As a result of droughts and early frosts in some sections, destructive storms in others, short grain crops in the North and Northwest and a small cotton crop in the South, with the low prices which are ruling, and with factories closed or running but part of each week, the outlook for trade during the next few months, especially in view of the financial stringency, could not be expected to be especially prom-

ising. In the face of all these discouragements, it is the opinion of many conservative and intelligent Hardwaremen that if no further disaster overtakes the country an improvement in trade is assured. The States depending largely upon a single product, as the South upon cotton, the Northwest upon grain, the Silver States upon mining, &c., will, it is expected, be longer in recuperating than those States which have diversified interests.

Advices from Chicago. — Orders are stated to have increased every day last week for seasonable goods as sold by Shelf Hardware jobbers. The demand for staple goods and for straight Hardware is, however, improving but slowly, although every order contains a greater or less list of this character. The business running so largely to seasonable goods shows that merchants are still ordering only what they must have to meet the immediate or prospective pressing wants of their trade. The demand for Sheet Iron is notably heavy and jobbers are now complaining that their receipts from the mills are by no means up to contract and they are having difficulty in supplying the wants of their customers. The Cordage trade has made a decided gain in activity. Stocks at both factories and in jobbers' hands here were allowed to run so low during the summer that the fall demand has brought on a very heavy movement suddenly, and more orders have been entered during the last week than in several months previously. An immediate stiffening in price was the consequence; in some cases a gain of one cent per pound is reported. The Heavy Hardware jobbers are also doing much better. Last week witnessed quite a revival in this line. Inquiries are coming in frequently from the country trade, and seasonable goods are beginning to move in this line also. Sleigh stock is in request for the extreme Northwest. Collections are very fair from all localities.

Notes on Prices.

Wire Nails.—A moderate degree of activity characterizes the Wire-Nail market. A good many small orders are being received, and it is understood that negotiations are in progress with some large buyers. The market, in the matter of price, is not entirely regular. Some of the mills are holding firmly to $1.50, f.o.b. mill, on all ordinary lots, but other manufacturers are understood to be shading this figure slightly. Negotiations between the manufacturers, with reference to an organization which will result in the control of the market, are still in progress, but it is understood that some difficulties have been encountered, and it remains to be seen whether or not the manufacturers will be able to surmount them.

Advices from Chicago.—A better inquiry and much more business are reported by the Wire-Nail manufacturers. Some very good orders have been received the past week from large buyers who either believe that this is a good time to stock up or else find that their trade are making heavy drafts on such goods. The last may probably be the case, as the leading houses all report a good movement in progress. Manufacturers' prices have recovered to some extent from the recent decline, and one large concern has made a distinct advance of 5 cents per keg since our last report. The general quotation on factory lots is now close to $1.50, Chicago. Small lots from stock are selling at $1.55 to $1.60.

Cut Nails.—There is little new to report in the Cut-Nail market. Quotations are evenly maintained on a basis of $1.05 for carload lots, f.o.b. mill. More inquiry is reported, but the movement of Nails is comparatively small. Small lots from store in New York are held at $1.25 to $1.30.

Advices from Chicago.—A very fair movement from factory is reported in Cut Steel Nails. The inquiry in this line is increasing and the coming week promises to be one of even better trade. Prices are unchanged at $1.20 to $1 25, Chicago, for factory lots, and $1.30 for small lots from stock.

Barb Wire.—The Barb-Wire market is comparatively quiet, the volume of business being moderate. Manufacturers are desirous of obtaining orders, and as a result prices show indications of slight weakness. The market is represented by the quotation of $2.40 to $2.45 for carload lots at mill for Four-Point Galvanized.

Advices from Chicago —The demand for Barb Wire is very much better. The August movement in this line turns out to have been better than was expected at the time, as manufacturers estimate that it fell but 20 or 25 per cent. below August of the previous year. The gain on the business of July was very great, as the trade that month was only about one-half of that of last year. Jobbers report a better movement from stock, but only in small lots. The car load trade is going almost entirely to the manufacturers. Prices are unchanged, carload lots being quoted at $2.45 for Galvanized and small lots from stock $2.60. Special brands are selling at a good advance on these prices.

Washing Machines. — The Wayne Combination Washer, a description of which was given in our last issue, which is manufactured by the Anthony Wayne Mfg. Company, Fort Wayne, Ind., is sold at $42 per dozen. The following are the prices of the other machines of their manufacture:

	Per dozen.
No 1 Anthony Wayne Washers	$42
" 2 " " "	36
Wayne American Washers	33
No. 2 Western Star "	36
" 3 " " "	39

Market Wire. — The market for plain Wire continues stagnant, with only a very moderate volume of business. Some improvement, however, is noted, and inquiries are being made which indicate that some increase in the volume of trade may be expected. Prices are slightly lower than they were two or three months ago. Most of the business is done on the basis of net prices rather than by list and discount.

Bright Wire Goods.—The market for Bright Wire Goods continues open, there being no combination or agreement among the different manufacturers. The result is that prices are low and somewhat irregular, some of the manufacturers refusing to meet the extreme quotations made by their competitors.

Fruit Picker.—The Cleveland Novelty Company, Cleveland, Ohio, sell their Gray Fruit Picker, described in our issue of September 9, to the trade at $5 per dozen, net.

Pump Curbs and Tubing.—The all-metal Pump Curb and Tubing manufactured by Bellevue Pump Company, Bellevue, Iowa, and recently illustrated in *The Metal Worker*, is sold to the trade at the following net prices:

Kegler's Galvanized Iron Chain Pump Curbs, each	$2.50
Kegler's Galvanized Iron Chain Pump Tubing, per foot	$0.10
Couplings for Tubing, each	.15

Cordage.—The Cordage Market continues in substantially the same condition as for several weeks, and the trade are evidently awaiting developments. The questions in regard to the reorganization of the National Cordage Company are not yet settled, but the general expectation is that the business will be put in shape to protect the different interests involved, but it is not thought likely that an attempt will be made to control the market, a project the difficulty of which is apparent since the failure of the National Cordage Company in this direction. Nearly all the outside concerns are in operation and report a fair amount of business. Within the past week an improvement in the demand from the West has set in, but buyers are not placing their orders with any freedom, limiting their purchases to their early requirements. The stocks in some hands are, however, reported as exceptionally low. There is also a feeling that when the pending questions with regard to Cordage interests are settled there will be a stiffening in the price if business assumes a fair volume. It is recognized that the present price of Cordage is exceptionally low and it is claimed by the manufacturers that existing quotations do not yield any profit, the margin between the cost of the raw material and the finished product being exceptionally narrow. Some well-advised parties who take a sanguine view of the market think it not unlikely that there may be an advance of 2 to 3 cents per pound. While some improvement is probable, it has, however, to be remembered that the

competition between the different manufacturers will unquestionably continue active, which will have a tendency to keep prices down.

Sheet Zinc.—Under date September 6 Matthiessen & Hegeler Zinc Company, La Salle, Ill., issue revised prices on Sheet Zinc, in which changes are made in the rate, in the extras and in the discounts. The price is announced as $4 per 100 pounds for Sheet Zinc in 600 pound casks, of the thickness between Nos. 9 and 15, inclusive, and of the widths between 32 and 46 inches, and of the lengths between 84 and 90 inches. The following are the revised extras in cents per 100 pounds:

Nos.	5	6	7	8	9	10	11	12	13	14	15
32 to 40 x 84	30	20	10	05	....	.....	....	.....	.....	..	....
32 to 46 84 x 90	....	....	....	....	none	none	none	none	none	none	none
52 x 84	....	....	100	40	35	30	20	20	20	20	25
50 x 84	....	....	65	35	25	15	10	10	10	15	15
48 x 108	....	....	50	40	30	20	10	10	10	15	15
48 x 96	....	....	45	20	15	10	10	10	10	10	10
48 x 84	105	60	35	15	10	05	05	05	05	05	05
36 x 108	70	60	30	15	15	10	10	10	10	10	10
36 x 96	55	30	15	10	10	05	05	05	05	05	05
30 x 84	45	30	20	10	05	05	05	05	05	05	05
28 x 84	50	35	25	15	10	10	10	10	10	10	10
26 x 84	60	40	30	20	15	10	10	10	10	10	10
24 x 84	65	45	35	10	05	05	05	05	05	05	05

The extra on No. 4 36 x 84 is $0.55 per hundred pounds.

The charges for small lots are as follows:

In casks of 100 pounds (all numbers up to and including No. 12), 30 cents extra per 100 pounds.

In boxes of 100 pounds (not larger than 30 x 40 inches), 30 cents extra per 100 pounds.

In 200 and 300-pound casks (all numbers up to and including No. 14), 20 cents extra per 100 pounds.

The revised discounts are as follows:

Discounts.	First Class. 15 600 pound casks, and upwards.	Second Class. 10 to 14 600 pound casks.	Third Class. 5 to 9 600 pound casks.	Fourth Class. Under 5 600 pound casks.
Special	0 per cent.	0 per cent	0 per cent.	0 per cent.
Cash with order	3 " "	3 " "	3 " "	3 " "
Quantity	3 " "	2 " "	1 " "	0 " "
	6 " "	5 " "	4 " "	3 " "

All discounts are computed straight when money accompanies the order, and the quantity discount is added to special discount in all cases. If the remittance is received within ten days of the date of invoice the cash discount will be only 2 per cent. instead of 3 per cent. and not computed straight.

Apple Parers.—There is little new in the assortment of Apple Parers put on the market this year, and prices show but very little change since last season. The apple crop is generally referred to as light throughout the country, and it is not thought that there will be the usual consumption of Parers.

Glass.—There have been no interesting developments in the Glass market during the past week, and the demand is still for small lots. There is considerable difference of opinion expressed regarding the reported small stocks of Glass on hand. It has been recently estimated that the manufacturers of the country have nearly half a million boxes of Window Glass in stock, while the stocks of jobbers and sash and door manufacturers are supposed to represent another million boxes. These figures would probably not be considered large in prosperous times. Official quotations remain unchanged.

Old Rubber.—The market for Old Rubber continues dull. The little business that is done is at about the following prices, delivered in New York:

Car Springs, ton lots, ℔ lb.	.... @	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	.... @	.03
Rubber shoes, less than carloads, ℔ lb	$0.2¼ @	.03⅛
Large Hose, ℔ ton	.... @	9.00
White Wringer Rolls, ℔ lb.	.... @	.04¼
White Syringes, ℔ lb	.... @	.05

Old Metals.—The demand for Old Metals continues light, and prices are very low. In Scrap Iron, however, the market at last shows a better feeling, after a long period of absolute stagnation. There has been a marked increase in inquiries, with some scattered orders, since the first of the month. Some of the mills now starting up will probably become buyers within the next few weeks, and dealers are looking for better trade, and possibly better prices, in the near future. New York quotations are given as follows:

Heavy Copper	℔ lb 6¾¢
Light and Tinned Copper	℔ lb 6¼¢
Heavy Brass	℔ lb 5¼¢
Light Brass	℔ lb 4½¢
Lead	℔ lb 2¾¢
Tea Lead	℔ lb 2½¢
Zinc	℔ lb 2½¢
No. 1 Pewter	℔ lb 14¢
No. 2 Pewter	℔ lb 6¢

Heavy Cast Scrap, ℔ gross ton	12.00 @ 13.00
Stove Plate Scrap, ℔ gross ton	7.00 @ 8.00
Burnt Iron (delivered at mill) ℔ gross ton	5.00 @ 6.00

Old Rags, Paper, &c.—Business in these materials shows some indications of improvement, the demand from Paper mills having revived to a moderate extent during the past week or two. Quotations for Old Rags, Paper, &c., delivered in New York are given as follows:

No. 1 White Rags	℔ lb 3	@ 3¼¢
No. 2 White Rags	℔ lb	1¾¢
Mixed Rags	℔ lb	¾¢
Blues and 3ds	℔ lb	1 ¢

The Habit of Dating.

If there is any one thing of importance next to the inherent value of calculations, sketches, memoranda and the like it is a knowledge of the time at which they were made. It is a very simple matter to put a date on everything, once the habit is established, but a very exasperating matter to have it missing when a knowledge of it would instantly settle a vexed question of priority. Almost worse than no date at all is the use of the word *new* to indicate the most recent. When one looks through a lot of drawings and finds—as may be done in well-known establishments—a lot of successive designs of the same article, each entitled *new*, he wonders what service the draftsman thought he was rendering a future generation by the use of this indefinite and aggravating designation. In these days of time and dating stamps there is no excuse for not forming the habit of dating everything, large or small, important or otherwise, and thereby avoiding all vexation and discussion over what is a very small thing to omit, but a very great thing when omitted.

The Modern Plumber.

It is doubtful if there has been an advance within recent years in any other trade equal to that which has been made in plumbing. To-day there is added to the manual skill of the trade a fund of scientific information and technical knowledge that places a true modern representative of the craft on a level with many professional men. That there will always be workers and thinkers in all trades is conceded, and, though the words "sanitary engineer" are frequently displayed as a sign where they are a misnomer, competent sanitary engineers exist and are the outgrowth of the progress in the trade. Some of the very best are practical plumbers who have read and studied until their applied science is more valuable than that of their more deeply learned brother, who is apt to become theoretical, particularly when the value of the result and the cost of its production are compared. The percentage of valuable thinkers is always unequal to the demand, and this fact will guarantee employment for the sanitary engineer, as the character of the work required is elevated above the education of the average man. This advance in the trade is pleasant to note, and it is reflected by the inquiries received from all sections for information on subjects that ten or twelve years ago were not of interest to the craft. The present seems an era of regulation, tending to better plumbing and sewerage all through the country, and those who would reap the benefit must understand and meet the requirements or be left in the march of progress.

Starting Up the Heaters.

There are two methods of leaving steam heating and hot-water heating apparatus when discontinuing their use in the spring. One method is to leave the apparatus filled with water and the other is to draw off the water while hot, and let the apparatus dry itself out by its own residual heat. Of course in a steam heating apparatus only the boiler and the return mains and risers are thus filled up to a level with the top of the boiler. In a hot-water apparatus the whole system is filled. Water standing in an inclosed space hermetically sealed, after having been exposed for a time to a boiling temperature, will remain sweet indefinitely. But if, as is generally the case in steam heating apparatus, access of air to the interior of the apparatus is permitted through air valves, and sometimes around the stems of radiator valves which are imperfectly packed, the water may become putrid and acquire the smell common to all stagnant water. The water may be rendered sweet again by continued boiling, but it will require a considerable time by evaporation into the air to free it perfectly from the stagnant odor. Hence, it is often the case in steam heating plants not provided with automatic air valves connected with drip pipes that in filling the radiators with steam when firing up in the fall a very disagreeable and unwholesome odor is caused to pervade the house. This will not occur when the apparatus is dried out in the spring, and it may be wholly avoided when water has been left in it during the summer season by drawing off the water which has stood in the apparatus and replacing it with clean water before firing up. It is supposed by many that the interior of a heating apparatus suffers less from rust when filled with water and standing cold than when emptied; and this is the reason for leaving the apparatus filled when it goes out of use, but water in a heating boiler should always be ascertained to be pure before the fire is lighted in the fall.

Young Men's Institute.

On Tuesday evening, October 3, special exercises will be held in the hall of the Young Men's Institute, 222 to 224 Bowery, New York, to formally open the educational work for the season of 1893–94. This institution has for several years been doing a very valuable work in offering to young men engaged during the day exceptionally good evening classes in subjects bearing directly on their daily work. There are technical subjects which assume a prominent place in the curriculum; classes in carriage drafting, steam engineering, practical electricity, mechanical and architectural drawing and freehand drawing; also penmanship, bookkeeping, shorthand, typewriting, English grammar and composition, vocal music, glee club and first aid to the injured. The school year continues until May, when prizes, diplomas and certificates are awarded. The classes are open to all young men from 17 to 35 years of age.

The Value of Criticism.

The most powerful factor in obstructing the spread of error is just and generous criticism. Unfortunately, this altogether useful and salutary means for promoting the spread of sound knowledge and intercepting falsehood is too often rendered bitter and offensive by the language in which it is couched. Not content with pointing out the error which he essays to correct, or the deficiency in the statement of fact which he has discovered, the critic is too frequently tempted to indulge in the language of sarcasm and to wound the feelings of the one whose failings he points out by the needless use of personal allusions or derogatory epithets, that serve no purpose whatever but to gall and irritate. If only people would remember when assuming the *rôle* of critic that the object of criticism is only to bring out truth, and that unless the person criticised has rendered himself obnoxious on such grounds as justify the shafts of sarcasm, the mere fact that he has committed an error does not justify an attack upon his character, his acquirements or his motives.

The Sheet-Iron Business.

The wonderful vitality of the iron and steel sheet business has been forcibly illustrated during the past two months of depressed trade. Bar mills and guide mills have almost without

exception been idle during that time throughout Ohio, and very little has been done in that line in other States. At the same time several sheet mills commenced operations about the middle of August, and the number has daily increased until at least 40 light sheet mills are known to have been in operation last week in Ohio, Indiana, Kentucky and Western Pennsylvania, some of them running two turns and others three turns during 24 hours. This does not include tin mills. Those included are mills making light sheets from No. 18 to No. 30 gauge. The total product of these mills for the week ending September 9 would be not less than 2000 tons. The principal uses to which this material is put are roofing, galvanizing and stove pipe, large quantities being used for stamped goods, kitchen utensils, stoves, and a great variety of purposes.

Machinery Sales at the World's Fair.

The commercial side of exhibiting at the World's Fair is one of the subjects usually and very properly kept in the background. If every exhibitor was to look for quick commercial results, and to undertake no display unless he was pretty thoroughly satisfied that he would be reimbursed his outlay by the time the show was over, there would perhaps never be a universal exposition worth looking at. The very people taking part would be makers of novelties of the catch-penny order, for which there is a good sale wherever crowds can be collected. Most exhibitors engage in an affair of this kind for the sake of the permanent results flowing from such an advertisement of their products, or to contribute to the glory of their country, of whose every achievement they are proud, or for the gratification of personal pride in showing to representatives of the world at large some triumph of ingenuity or of patient, persistent, indomitable application. And yet there is hardly an exhibitor who does not hope for some immediate return on the investment necessary to make an attractive exhibit. Even those who enter the lists from motives of patriotism and for personal glory are gratified to have their enterprise rewarded by substantial recognition. The inventor of the most ingenious piece of mechanism in the world may be flattered by the homage of the crowds that throng to see it, but such pleasure is as "sounding brass or a tinkling cymbal" to the gratification felt by the receipt of orders for the duplication of the device from practical people who appreciate its true value.

The World's Fair has thus far been a great success in attracting visitors, notwithstanding the stress of financial trouble throughout the country. There has also been a fair representation of foreign visitors, though by no means so large as had been expected. Exhibits have been quite thoroughly inspected by these visitors, who seem to have almost made it a religious duty to see everything in any way worth seeing. Registers kept by exhibitors of machinery generally are well filled, showing that they cannot complain that they have been altogether thrown in the shade by the numerous lighter attractions provided by the World's Fair managers. But when the question is asked as to the direct commercial result of the exhibits made, the answers returned show a wide variation. There are, for instance, some large makers of machinery very popular in certain trades who state that they have not taken an order for a single machine, although their exhibit is a good one, covering their entire line, and each machine can be shown in actual operation, doing its most perfect work as a matter of course, as it is run by an expert from the factory. Others report a few sales, but by no means what they expected when they looked forward to the World's Fair and heard the extravagant estimates made of the probable attendance. There are some, however, who are well pleased with what they have accomplished in booking orders and who will go home when the fair is ended well satisfied with the commercial results and ready to prepare for the next universal exposition with a great deal of enthusiasm.

The financial stringency is, of course, held primarily responsible for the lack of orders from visitors. Many exhibitors of standard machines report their callers making the remark very frequently that they "need just such a machine, but the times are now too hard and work is too slack to think of buying one." The manufacturers of machines somewhat out of the ordinary line, or making a decided improvement on the tools of the same character heretofore in use, have been more fortunate. Their orders may be affected to some extent by the unsettled financial conditions, but they are nevertheless doing very well, and find no fault with the business outcome of their World's Fair venture. If it were possible to get from all the American machinery exhibitors exact reports of the domestic and foreign orders entered, we believe the aggregate thus shown would be quite satisfactory and would be a conclusive argument in favor of making exhibits at such expositions. The fragmentary knowledge we have thus far been able to obtain covers sales made to almost every civilized country on the globe and to some that have thus far not been classified under this head in the geographies.

Something may be said in this connection with regard to the proper reception of visitors by exhibitors. Not every attendant in charge of an exhibit is by any means an ideal salesman of machinery. For many men who have been sent to the World's Fair to represent large interests look upon their function in this particular as one that can be easily discharged with very little actual labor or trouble. Some regard their appointment to such a responsible post as leave to take a holiday, and they are seldom found at the exhibit over which they are supposed to preside, but are "taking in the exposition." Others treat callers with indifference, exerting themselves but slightly in the effort to entertain and interest possible customers. The politeness of most people, especially foreigners, restrains them from entering an inclosed space unless they are specially invited to walk in. An exhibit of ingenious automatic machinery may mutely invite closer inspection, but an intervening railing which presents a barrier seems to warn the outsider to stay out, especially if there is a closed gate which some very acute railing maker has designed so that there is no visible way by which it can be opened. Unless an attendant is on the alert and personally invites a passer-by to enter who seems interested, he may miss many golden opportunities to secure customers. Machines do not sell themselves, and in these days of competing specialties there is hardly a piece of mechanism which does not have a competitor accomplishing the same purpose in a slightly different way. Hence, alertness and readiness to cultivate acquaintance with visitors are indispensable requisites for good and efficient attendants at exhibits. The most successful sellers of machinery at the exposition are men of this character. We recall one in particular who has made numerous foreign sales, who will even invite his visitors to get under a machine if they wish, so as to be able to see the feeds more thoroughly. He says his machines have been put on exhibition to be exhibited, and that he has greater success in making sales by appearing to conceal nothing than if he were to be in a chronic state of fear that foreign visitors were merely inspecting in order to steal American ideas.

Water at High Pressure.

The following item from an exchange treats of an interesting question, but the author seems to have forgotten the unfortunate result of former enterprises which attempted to make use of water under high pressure. Important progress, says our contemporary, is believed to have been made in solving the problem of storing heat, one of the latest suggestions in this line being that by Mr. Halpin, a London engineer, who proposes to use boilers and engines, but to store heat during the day in specially constructed reservoirs. As the water in the boilers is raised to 250 pounds pressure it is conducted to cylindrical reservoirs, resembling English horizontal boilers, and stored there for use when wanted. In this way a comparatively small boiler plant can be used for heating the water to 250 pounds pressure all through the 24 hours of the day, and the stored water may be drawn on at any time, according to the extent of demand—the steam engines to be worked by the steam generated by the release of pressure from this water, and the valves to be arranged in such manner that the steam shall work at 130 pounds pressure. In favor of this plan the statement is made that a reservoir 8 feet in diameter and 30 feet long, containing some 84,000 pounds of heated water at 250 pounds pressure, would supply 5250 pounds of steam at 130 pounds pressure—these data being the result of investigations made with great care by Professor Unwin.

THE LETTER BOX.

An Ingenious Safety Valve.

From C., *New York.*—The occasional appearance of an item narrating the explosion of a low-pressure steam boiler used for heating purposes prompts me to suggest a way (which, for all I know, may have been frequently tried, but which I have not seen) for positively preventing such accidents.

The steam pressure for such purposes is seldom over 8 pounds per square inch. If a connection is made to the lower part of the boiler where the water is and a pipe is led from this point up to an elevation of about 20 feet, and then returned to the fire box, the fire would be put out by the discharge of water into it as soon as the pressure reached a point when it would raise the water over the 20-foot mark. This would be about 9 pounds. If a spraying end was placed on the pipe the quenching of the fire would be more gradual and equally efficient. If it is desired to carry a higher pressure than 8 pounds the pipe must be carried to a corresponding higher point. The chief objection to the plan is that the discharge of water into a fire pot might make a dirty mess around the boiler or might possibly crack some casting, but inasmuch as the apparatus would only act when both the damper regulator and safety valve were out of order or not working, the objections above do not seem of much importance. It would positively prevent an explosion. There is also made a pop safety valve which has over it a whistle, which, if set at any pressure, will give an alarm if this pressure is exceeded. It works well and will wake up the whole household (and all the neighbors, too) if the boiler attendant has gone away and left the draft door open and the pressure gets too high. I bought one to put in my own house and speak from experience.

Regarding Furnaces.

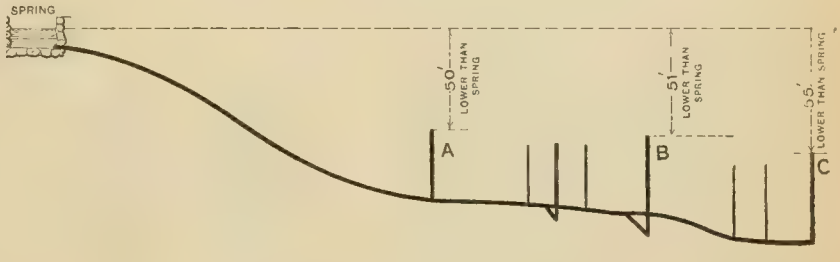
From S. T., *Boston.*—Jack Frost will soon show that he is working in the interest of the fuel dealer, and in order that the house owner may have some chance and not pay out all of his spare cash for fuel, it behooves him to have his furnace put in order before the white frost turns the leaves black. It is a good plan to take out all of the heating pipes and register boxes and give them a thorough cleaning, as the dust that is liable to collect inside may cause a bad odor when hot air is brought in contact with it. The furnace itself is liable to be covered with dust, and when a fire is started this dust is liable to burn or roast and give to the air a "stuffy" odor that is very unpleasant. By removing the dust from the furnace this disagreeable feature is obviated. The smoke pipe also demands careful attention, for if it is partly filled with soot or ashes the draft will be greatly impaired. While the furnace may show a disposition to draw in a sufficient amount of air for active business, the products of combustion may not have an opportunity to escape with sufficient rapidity. This will prevent the fuel from giving off the proper amount of heat. When a furnace is first put in it is supposed that all joints are properly cemented and gas tight. The unequal expansion and contraction of parts may cause the cement to crumble or crack so as not to properly retain the gases. A remedy is easy to suggest: the joints should be made tight by the application of fresh cement. A weak point in many furnaces is where the smoke pipe joins the radiator. The smoke-pipe collar is usually quite short, and if the furnace is set in brick the furnace may have settled unequally so as to loosen this joint, however perfect it may have been at first. The burning out of cement or warping of castings in a portable furnace may cause a loose joint through which gas or smoke may pass.

A furnace may be provided with a cold air pit, and while this may be a very proper way of setting, if surface water collects in the pit and, perhaps, in the cold-air duct, the water may become stagnant and cause unwholesome odors to pervade the house. If by any means some living creature should get into the cold-air pit, box or duct, and should there lose its life the unpleasant result to the atmosphere of the house is readily imagined. It is rather difficult to properly clean the interior of a furnace, especially when soft coal is used for fuel. When hard coal is used there is usually a coating of dust that forms on the inside of a furnace. To remove this scale it is only necessary to build a brisk fire, open the direct damper and then throw in some sheet zinc. The gas generated by the combustion of the zinc is of such a nature as to cause the scale to fall off. If there is an evaporating pan of any kind used in the furnace it should be kept clean. Supposing the furnace and connecting pipes to be in good order, it may be well to pay some attention to the house. If the fresh-air supply is obtained through a cold-air box or duct, there should be some means of exit for the foul air. For this purpose a fire place or other opening can be used when there is no system of ventilation employed.

Piping Water From Spring.

From F. B. L., *Saxton's River, Vt.*—We are having trouble with some water pipes that lead from a spring, and would like the opinion of *The Metal Worker* and its readers as to the cause. The water comes from the spring through a 1-inch main, and all of the branches are ½-inch pipes that lead to cisterns where the water runs all the time through a $\frac{1}{16}$-inch opening without any faucets. The upper half of the main is lead pipe and lower half cement pipe. Water runs well from all pipes which discharge on the lower floor, but fails at B and C, shown in the sketch, which run to the attic. Sometimes water has run well at all places. The outlet A is 50 feet lower than the spring, but is 1 foot higher than outlet B, which has a vertical rise of 25 feet. At C the outlet is 55 feet lower than the spring, and has a vertical rise of 30 feet. There is plenty of water in the spring. We are having difficulty in locating the trouble. Some contend a leak makes the trouble, others think it is a stoppage. It runs well at A, which is the highest point on the line. Could it run at A if there was a leak at or near the lower end in preference to the vertical outlets B and C, which are 1 and 5 feet lower than the outlet?

Note.—From the character of the pipe used in a portion of the main, bad joints or breaks might result from settling, when leaks would affect the supply or permit the entrance of something that would obstruct. The many rises and falls that would naturally occur in such a pipe are similar to traps, and if air collected in any or several of them more or less resistance would be met by the supply pressure. The fact that all has at some time worked well leaves no doubt but there has been some change in the conditions, which, however, may prove troublesome to detect. We would like to hear from our readers on this matter.



Piping Water from Spring.

Improved Furnace Top.

From A. W. GLESSNER, *Chicago.*—In your issue of September 9 I notice a communication from A. L. Burtis of Lockport, N. Y., with reference to an improved furnace top, concerning which I beg to call your attention to the fact that the Excelsior Steel Furnace Company of Chicago manufacture a very extensive line of furnace tops or bonnets, including among other bonnets the one shown in cut in connection with the article referred to, with the exception that the entire bonnet is made of galvanized iron. One objection, and a serious one in my opinion, to the style of furnace top shown in cut is the fact that the cast-iron frame would be a serious drawback in cutting of collar in side of bonnet. In almost every furnace job it is impossible to tell exactly where collars are to be cut in until the mechanic is on the job, and it is often

necessary to cut in collars close together, and with the cast-iron frame or any other kind of a frame it would be impossible in many cases to cut the collar in the right place. A collar would be just as apt to strike the middle of one of the ribs of the frame as to come between the ribs. I agree with Mr. Burtis that an improvement in the furnace business is being effected by improved furnace fittings made by machinery, and machine-made bonnets are also a very great improvement over the ordinary shop-made bonnets, and in a very great number of cases the shape and style of a bonnet have very much to do with the heating of a job.

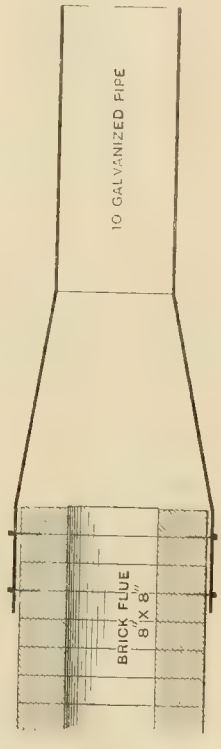
Area of Roofs.

From H. F. N., *Frankford, Pa.*—I wish to thank you for the article in *The Metal Worker* of September 9 in answer to my queries regarding the area of roofs. I understand the principle that you set forth, but its application is still beyond me. You said: "To determine under which division two sets of figures come when multiplied together, it is only necessary to add the indices—thus $1^\circ \times 1' = 1'$." I read that 1 foot multiplied by 1 inch or prime is equal to 1 inch, or prime, which conveys no meaning to my mind. Again $2' \times 9' = 18''$. I would expect that the $18''$ would be $18'$, or the same as the multiplier and the multiplicand. Finally, what is the meaning of $66^\circ\ 2'\ 6''$ in your answer? Is the $6''$ to be read as $\frac{6}{12}$? These points made clear will confer a great benefit upon me, as I have no doubt that your idea will just suit me.

Answer.—We think we can easily clear up our correspondent's difficulty. The prime marks are 12ths and the second marks are 12ths of the primes, or 144ths of the feet. Hence $1^\circ \times 1' = 1'$ or $\frac{1}{12}$ of a square foot. $2' \times 9' = \frac{18}{144}$ of a square foot. Our correspondent will understand that the primes stand for inches and if instead of multiplying them together as primes he will consider them as fractions of a foot he would have have $\frac{2}{12} \times \frac{9}{12} = \frac{18}{144}$, the same answer as given above. Our correspondent will perhaps better understand this matter of the multiplication of two quantities giving a smaller quantity if he will consider them as fractions. $\frac{1}{2} \times \frac{1}{2}$, for instance, is $\frac{1}{4}$. Proper fractions reduce themselves as they are multiplied together.

Some Ideas on Chimneys.

From CÆSAR, *Louisville, Ky.*—My methods of testing a flue are governed by certain rules that are arbitrary, and if they are not properly understood the operator will be in the dark the greater part of his time. The knowledge of chimneys is acquired only by long years of observation and experience. It is a difficult matter, however, to write up this subject intelligently, for circumstances do and will govern all cases, and the operator must be governed by them. In testing a flue I first remove the smoke pipe from bottom of flue and fill the flue with paper and burn it. This will give the average strength of the flue. Next observe the surroundings of top of flue. A flue may be ever so good and still its usefulness be destroyed by an overhanging tree or overtopped by the comb of roof or adjacent buildings. If the latter trouble is present it must be remedied by extending the top of flue upward until it rises above all obstructions. In nine cases out of ten flues are rendered useless by the manner in which they are topped out, as it is wrong to taper the pipe with the small end on the top. There is not one grain of common sense in this method of raising a flue. If a flue must be raised to work properly it should be done as shown in the sketch. For instance, if there is an 8-inch square flue, the addition must be at least 25 per cent. larger and extend high enough to correct the flue to which it is attached. There is no room for an argument on this question, for it will prove itself every time it is tried by giving perfect satisfaction. If the flue is flat it must be corrected by a reservoir at the bottom of flue.



Some Ideas On Chimneys.

Another point is this: the operator must be governed by the amount of work expected from the flue. For instance, the same result must not be expected from a furnace as would be secured from a stove. Supposing there is a flue 6 x 6, inside measure, which has worked all right with a stove attached, but must be used for furnace; what must be done if it cannot be torn down and rebuilt? It can be increased in capacity by velocity from 50 to 100 per cent. by compelling the heated air and gases that travel 1 foot within a given time to travel 2 feet within the same time. I know that I will raise a storm about my ears by the following: I have no patience with the theory of ascending and descending currents of air in a flue at the same time. My experience is that when there is a descending current in a flue there will be smoke in the house. To work a flue properly a vacuum must be created within the flue and this vacuum must be filled by the air and gases that are forced directly through the fire, and it must have no other openings between outlet collar on furnace and top of the flue. Flues that had sufficient area and hight have often proved worthless, but by using a weight and rope as many as six brick have been driven out of them that had been dropped by the builder and lodged in such a way as to leave a partial draft. The best shaped weight is obtained by using an ale bottle as a pattern, with a ring cast in the neck.

Steam Coil in Water Tank.

From L. W. F., *Massena, N. Y.*—Will you please describe in *The Metal Worker* the proper way to pipe a vat that is built up over the boiler for the purpose of heating water for a bath-house in the quickest way with the least fuel? The vat is 5 feet square and 2½ feet deep. It is now piped with 1-inch pipe in pieces 4½ feet long, and screwed together with fittings in cob-house fashion. The steam is taken from the dome of the boiler to the top of the coil, which has a gradual decline to the bottom, where a hole is made in the tank for a pipe to take the condensation back to the boiler at the lowest point, using a check valve about 3 feet from the boiler. The vat has a cover, yet it takes two hours to heat the water to 90°. I would like some light on the subject.

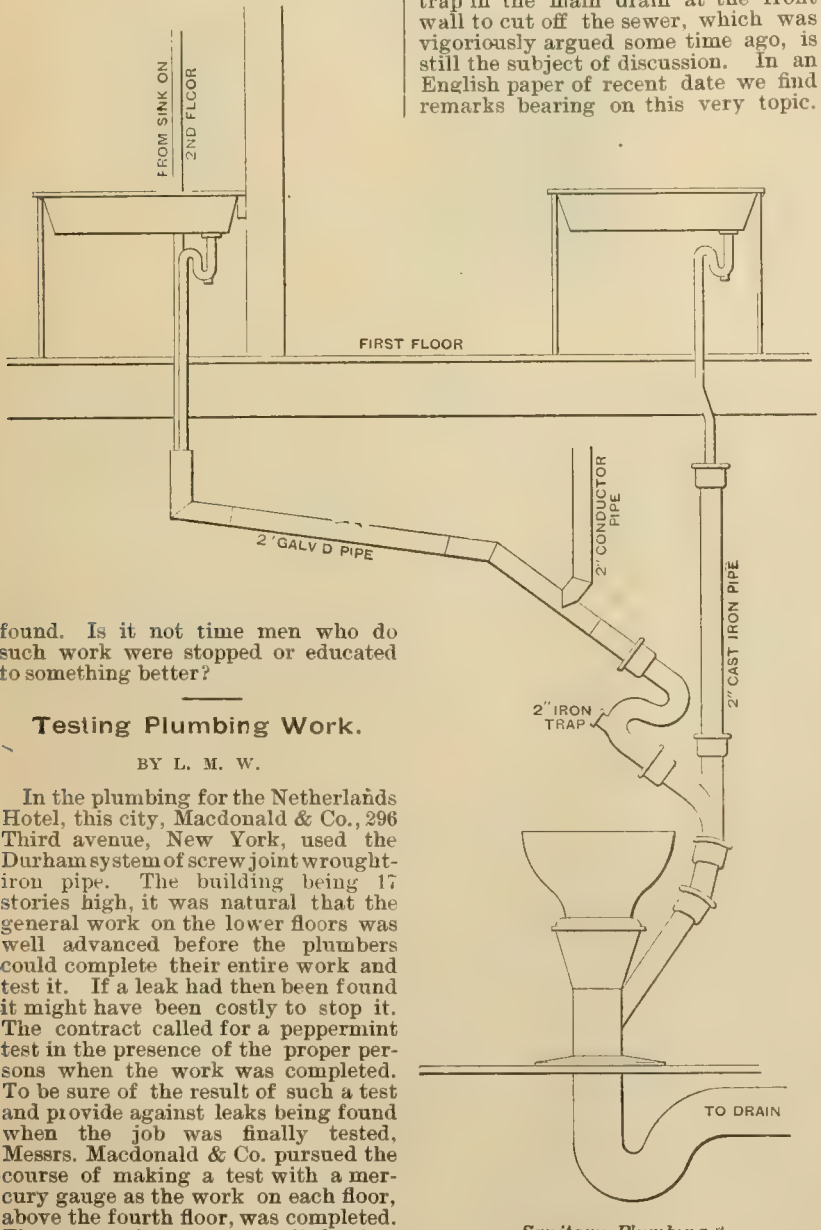
Note.—Some of our readers may be able to answer this question from the light of personal experience. It would be necessary, to give a correct answer, to know the pressure of steam. If the steam used is from a power boiler the exhaust could be utilized, and would probably be as cheap a way of heating the water as any. The number of feet of pipe that has been used in making the coil should also be known. It is generally believed that a coil running back and forth across the bottom of a tank is most effective. Some men of excellent practical experience prefer to use a large size of pipe in coils for heating water. The information given leads to the belief that an insufficient amount of heating surface is exposed in this case. By calculation this tank is found to hold about 470 gallons, and as some experienced men use 1 lineal foot of heating coil for every 3 gallons of water, there should be, according to their rule, about 155 feet of 1-inch pipe with a steam pressure under 50 pounds. If there is a high pressure of steam of 100 pounds or over 1 lineal foot of coil to 5 gallons of water might be satisfactory. Our correspondent can easily tell how many feet of pipe he has put in the coil and can calculate what change in surface is necessary to meet his requirements. In *The Metal Worker* of April 22, 1893, is an article on this subject, which discusses it exhaustively, that will be of interest.

Mr. Livesey of the South Metropolitan Gas Company, London, in an interview published in the *Daily Graphic* of that city, mentioned an instance of the obtuseness of domestics in the management of gas cooking stoves in the following experience: A gentleman had a new cooking stove fitted in his kitchen. The fitter from the gas company duly set it up and explained the working to the cook, lighting, at her request, every one of the burners. He then left. The end of the quarter duly came, and the meter inspector reported an abnormal consumption at this particular house. The company immediately sent down to inquire the cause, wishing to anticipate the indignant remonstrances of the owner of the house. Will it be believed the genius of a cook had never turned off a single burner, and that the stove had been incontinently consuming endless thousands of gas, day and night, for the full period of three months!

PLUMBING and GAS FITTING.

Sanitary Plumbing?

From H. W. S., *Portland, Maine.*—Inclosed is a sketch of some work that came under my observation as inspector of plumbing. The owner of the building proposed to make some changes and I was called to see what changes would be necessary to comply with the law, and this sketch shows what I found. Is it not time men who do such work were stopped or educated to something better?



Sanitary Plumbing?

Testing Plumbing Work.

BY L. M. W.

In the plumbing for the Netherlands Hotel, this city, Macdonald & Co., 296 Third avenue, New York, used the Durham system of screw joint wrought-iron pipe. The building being 17 stories high, it was natural that the general work on the lower floors was well advanced before the plumbers could complete their entire work and test it. If a leak had then been found it might have been costly to stop it. The contract called for a peppermint test in the presence of the proper persons when the work was completed. To be sure of the result of such a test and provide against leaks being found when the job was finally tested, Messrs. Macdonald & Co. pursued the course of making a test with a mercury gauge as the work on each floor, above the fourth floor, was completed. The peppermint test was applied, when the work was ready for it, in the presence of a number of persons interested in the result and failed to disclose a single defect. In so large a job it is hardly probable that such an experience could result unless some similar course was followed. In the applications of the tests made as the work progressed every opening was sealed. Then the mercury gauge was connected and the pressure applied to test the joints, when the mercury was raised in the tube to a point where it stood without variation for 15 minutes or more before the work was continued. After such precaution it is not strange that when the pipes were treated to a dose of hot water, strongly impregnated with the oil of peppermint, not a trace of its pungent odor could be found in the building.

TRAPS AND VENTS.

THE OLD DISCUSSION concerning the advisability of introducing a running trap in the main drain at the front wall to cut off the sewer, which was vigoriously argued some time ago, is still the subject of discussion. In an English paper of recent date we find remarks bearing on this very topic. Under the title of "intercepting traps" they are spoken of by T. de Croucy Meade, engineer to the Hornsey Local Board, in a report recently presented. His conclusions are as follows: Looking at this question from a purely official point of view, one might perhaps be tempted to favor the discontinuance of intercepting traps for the purpose of assisting the ventilation of the public sewers; but, from experience gained after years of careful investigation of sewer ventilation and drainage, I feel that I cannot advise a course which I consider fraught with danger to the inhabitants, more especially to those who occupy small class property, where the fittings are generally of a cheap and unreliable description. In districts of a semi-rural character, where there is plenty of open space surrounding each dwelling, and where all drains are kept outside the external walls, the danger of converting house drains into sewer ventilators may be lessened if special care is taken in fixing the ventilating pipe and maintaining it in an air-tight condition.

SOME exceptionally fine specimens of plumbing work are reported to be on exhibition at the National Workman's Exhibition of British Skilled Industries, now being held at Islington, London, under the auspices of the London Trades' Council.

A CIRCULAR is issued illustrating and describing the Dandy back-air vent or waste-pipe fitting made by Thomas Hyde, Albany, N. Y., for whom Fred Adee & Co., New York, are agents. These fittings are made 2, 3 and 4 inches.

THE BOARD OF HEALTH of Jacksonville, Fla., are sending the plumbing inspectors on a house to house examination of the plumbing and piping throughout the city. Five days' notice are given the owner in cases where the work is defective, when, if it is not remedied, the city makes the necessary changes. The board reports the health of the city good, without a case of contagious or infectious disease within the corporate limits. The disposition of the different States to enact laws to provide better sanitary supervision and to prevent the incompetent from doing work that has so vital an influence on the public health is commendable, from whatever source it may have come. The plumbers are open to some congratulation that as a rule they have lent their aid in bringing about this change.

AT THE LAST MONTHLY MEETING of the Green Bay, Wis., Board of Health, Plumbing Inspector H. F. Spencer reported a large increase in the users of water and that more attention was paid to providing proper drainage than ever before. The sanitary condition of the city was excellent, but one case of contagious disease being reported. The sanitary precaution arising from a fear of cholera extended far beyond the sea coast and the good effect of attention to such matters is being felt all over the country and to the furthest West.

THE PLUMBERS' UNION of Troy, N. Y., at their last meeting passed a vote of thanks to the Ross Valve Company for the handsome bamboo walking stick with a nickel-plated head representing one of their patent valves which was presented to the members on Labor Day.

INSPECTOR OF PLUMBING CHAMBERLAIN of Lynn, Mass., is finding some "skin" work in that city, and if the practice is continued there is a probability that some licenses will be revoked. Protests have been entered with the Board of Health by the plumbers and drain layers, but in every case the inspector has substantiated his charges in the interests of the citizens and good plumbing. Such

a course is likely to remove many disagreeable competitors from the field and through force of the law some men will be forced to acquire the information to do their work properly that they would never obtain from their own ambition.

IN FUTURE all who intend to go into the plumbing business in Worcester, Mass., whether as masters or journeymen, will have to submit to the provisions of the new plumbing law as administered by the board appointed. The chairman of the board is Charles H. Peck, inspector of public buildings; Dr. L. F. Woodward, chairman of the Board of Health, and John T. McCartney, inspector of plumbing, who is clerk of the board.

CERTIFICATES WERE GRANTED by the Plumbing Board of Watertown, N. Y., to E. B. Irvin and Chas. J. Dean for competency as employing plumbers, and to W. T. Norris for competency to lay sewers.

CHAS. TUCKER, 45 East Eleventh street, New York, has bought a Curtis & Curtis 6-inch pipe cutting and threading machine, and is equipped to do plumbing by the system of screw-joint iron pipe.

EDMOND L. GRUNDY, 18 Cottage street, Melrose, Mass., has been appointed inspector of plumbing for that city. He is a practical plumber with many years' experience in the city of Boston and is well qualified for the work.

THE BOARD OF HEALTH of Natick, Mass., have appointed Phillip J. Kenneally inspector of plumbing.

JAMES KILGOUR, West Springfield, Mass., has moved out on Madison avenue with his plumbing establishment.

THE NASHUA, N. H., Y. M. C. A. Gymnasium is to have bathrooms, and the plumbers are engaged in fitting them up.

A DEADLOCK between the Common Council and the Board of Health of Providence, R. I., delays the election of an inspector of plumbing at a salary of $1500 a year.

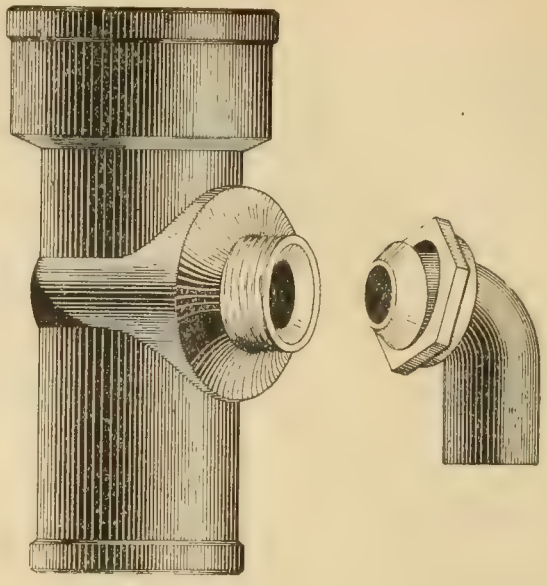
AT A MEETING called for further consideration of the plumbing and machinery for the Buckner's Orphans' Home, Dallas, Texas, D. J. Kavanaugh was elected chairman and H. H. Jones secretary of the Plumbing and Steam Heating Committee; specifications were then drawn up by the plumbers for the plumbing material needed. This committee reported to the general committee and the work has been commenced.

THE REQUEST of the Board of Health of Seattle, Wash., for the Mayor to veto the ordinance to do away with one of the sanitary inspectors calls out some comments on the enforcement of the law requiring inspection of plumbing and licensing of plumbers from M. W. Seymour. He says the law has never been enforced, and that about one-third of the shops in the city are doing plumbing without a license; that these plumbers are threatened by the inspectors, who also threaten the owners of buildings who employ them, but nothing but threatening is done. He thinks that if it is the sole duty of the inspectors to threaten, and there is no power behind them to enforce the law, there might as well be no inspectors.

DANIEL H. STREEPER, Norristown, Pa., has secured a patent on a device for thawing out frozen pipes. The invention consists of a boiler connected with a pump for supplying water to be heated and an outlet pipe through which hot water or steam from the boiler is forced by the action of the pump.

The Dandy Back-Air Vent.

The accompanying illustration shows the Dandy back-air vent or waste-pipe fitting, made by Thomas Hyde, 69 Perry street, Albany, N. Y. The illustration presented shows the fitting



The Dandy Back-Air Vent.

apart. One object of this fitting is to furnish the plumber with a simple means for connecting up a back-air vent, and it furthermore provides for ascertaining whether there is any stoppage in the vent, as it permits the back-air pipe to be disconnected at any time and replaced with little trouble. The couplings are ground into their seats so as to require no gasket, and the T being of the sanitary T form, the flow of air is not impeded by the friction of a square angle, nor can the scale from the iron or other substances fall into the branch pipe leading from the fixture. Couplings of any angle are furnished and they are made 2, 3 and 4 inches in size.

Patent and Trade-Mark Congress.

The World's Congress Auxiliary announces an unusually strong and interesting programme for its Patent and Trade-Mark Congress, to be held the first week in October. The influences which encourage or discourage progress are to be considered by able representatives of various countries, particularly England, Germany, Belgium, France, Sweden, Austro Hungary, Holland, Switzerland, Japan, Canada, Mexico and the United States.

It is expected that Hon. Henry W. Blodgett—for more than 20 years judge of the United States Courts at Chicago, and recently counsel for the United States in the Behring Sea arbitration—will be made permanent president of the Congress, and that representatives of the Association of American Inventors and Manufacturers and of the United States Trade-Mark Association will be made vice-presidents. It is also expected that Hon. Hoke Smith, Secretary of the Interior—the department of our Government from which patents are issued—and Hon. John W. Noble, Ex-Secretary of the Interior, will participate in the proceedings. Among other interesting features will be addresses from Hon. Richard Pope, Canadian Commissioner of Patents; Hon. John S. Seymour, United States Commissioner of Patents and several ex-commissioners; Hon. William F. Draper and Hon. Elijah A. Morse, members of Congress from Massachusetts; Hon. James Buchanan, ex-member of Congress from New Jersey; Hon. Carroll D. Wright, United States Commissioner of Labor; Dr. R J Gatling, president Association of American Inventors and Manufacturers; Francis Forbes, secretary United States Trade-Mark Association; Dr. C. Matzudaira, Imperial Japanese Commissioner to the World's Columbian Exposition; Carl Pieper of Germany; W. Lloyd Wise and Miss Ellen Blackburn of England; Dr. Snyder de Wissenkerke of Holland; John Bernstrom of Sweden; C. O. Paget of Austro-Hungary, and Judge Sepulveda of Mexico.

Although the programme is not yet finally made up, a large number of the papers or addresses are definitely promised. Ephraim Panning of 225 Dearborn street, Chicago, is chairman of the Committee on Organization.

At the inauguration of the new steamship services between Newport News and England on September 8, President M. E. Ingalls of the Chesapeake & Ohio Railroad, in the course of a speech at the banquet given at Newport News to the company's guests, referred to the opening of the line as a notable event in the commercial history of the country. The meats and grain and cotton and tobacco of the Ohio and Mississippi valleys, he observed, can now be carried out through the port of Newport News and by the new steamship line to all parts of Europe cheaper and quicker than through any other port on the continent. The opening of this line of steamships marks a new era in the commerce of this country. The merchant of Cincinnati, St. Louis and Chicago can to-day have his through bill of lading for goods for London and Liverpool given him direct by this line, and he can make his importations through this port. The first steamship of the line—the "Rappahannock"—sailed for Liverpool last week, and the six vessels belonging to the company will keep up a weekly service. The steamers are 370 feet in length and 44 feet in breadth, with a cargo capacity of 6000 tons, and contain fittings for 770 head of cattle.

THE METAL WORKER SKYLIGHT COMPETITION.

First Prize Essay.

By Henry M. Sanders.

PLATE 1.—GROUND PLAN AND ELEVATION OF SKYLIGHT.

Fig. 1 is the ground plan and Fig. 2 is the elevation of skylight, the skylight being 4 feet wide and 6 feet long. The bars on all four sides are placed 12 inches on centers. As in the construction herein set forth, the measurement of bars is on the curb line.

A represents the curb, B the hip bar, C, D, E and F the various side bars, which have the same form or shape, with the same miter at the curb, but with different miter developments at the top of bar. While all of these various bars C, D, E and F require miters at top and bottom, or curb, and as the curb miter is the same in all cases, we have only developed the curb miter for the bar C, on Plate V. Hence on those plates where we have developed miters for D, E and F we have only developed the top miter.

To obtain the length of hip bar *c b* draw the line *b k* at right angles with *b c* and make *b o* equal in length to hight of skylight, as shown by *f g* in elevation, Fig. 2. Draw lines from *c* to *o* and we have the length of hip bar B required, or, in this case, 36¾ inches. At point *e* on line *c b* draw dotted lines at right angles with *c b*, intersecting the line *c o* at *s*, or 18⅜ inches as the distance from bottom line of measurement of hip bar B to intersecting point at top of side bar E. The lengths of side bars C, D and F are all the same and as shown by *f h*, or 27¾ inches, in Fig. 2. The hight of skylight, as represented by *f g* in Fig. 2, is 13⅞ inches. The length of ridge bar G is 24 inches and the length of side bar E, as shown by *h m* in elevation, Fig. 2, is 13⅞ inches.

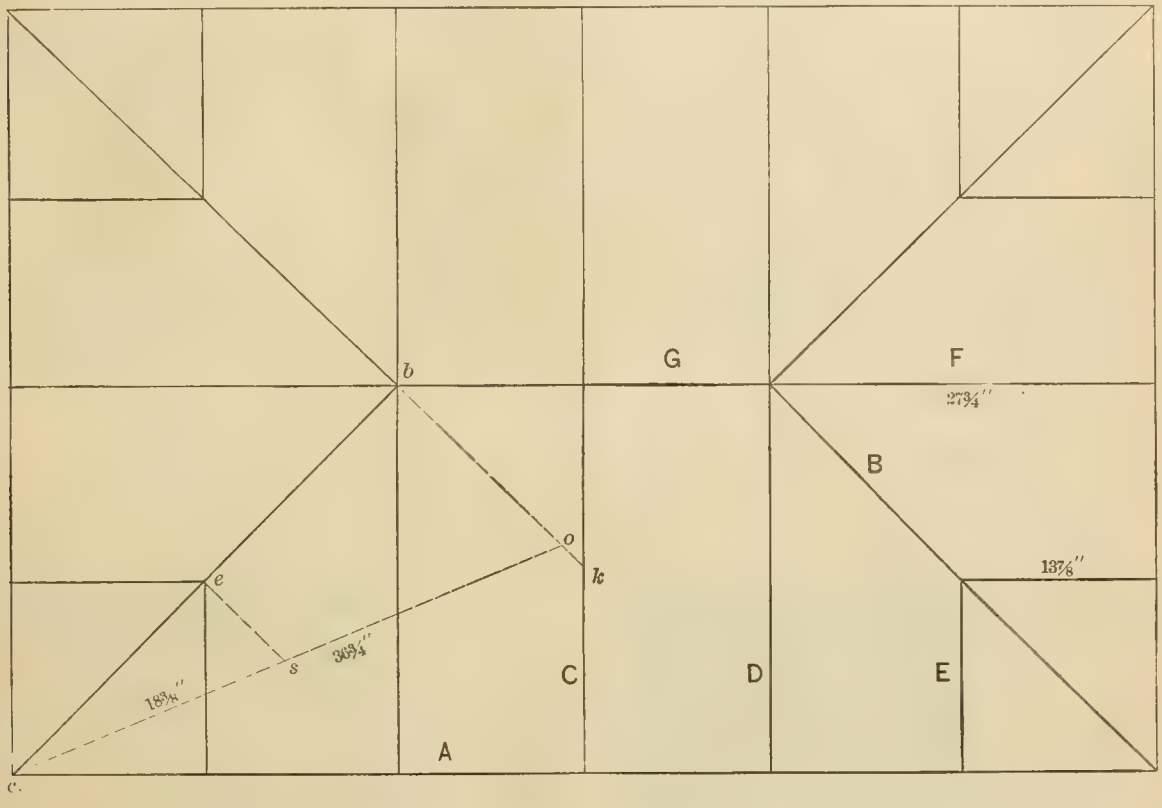


Fig. 1

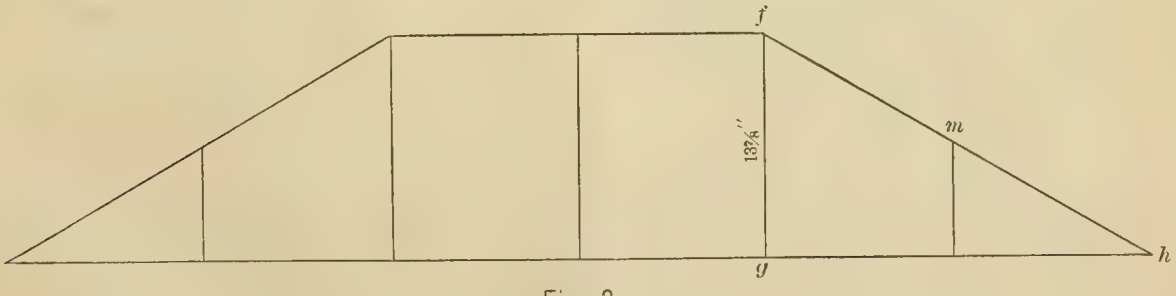

Fig. 2

PLATE I.—GROUND PLAN AND ELEVATION OF SKYLIGHT.—(SCALE, 1 INCH TO A FOOT.)

In cutting the glass for the skylight, cut it enough smaller than the space in the frame it is to occupy so as to allow about ⅛ inch space all around the glass.

In the development of miters as herein set forth I have applied a principle of development that it is believed will apply alike to any other form of bar or curb and to any other given pitch of skylight. While there is a great variety of bars and curbs in use, the ones I have selected for the development of patterns, being without curves, make less confusion of intersecting lines, and, being made with sharp angles, the bars are easily made on most machines and brakes used by skylight and cornice makers.

The size of bar I have given I have found of sufficient

strength to meet all the requirements of a skylight 4 x 6 feet, or of a similar size, on the pitch given. But as the skylight is increased materially in size we must also increase the size of bar and curb to suit the best construction. Very large skylights must have not only the bars increased in size but a core plate inside of them to secure the proper strength and stiffness to the bar. Also a cap over the gutter of bar, as shown by *c c* in section of bar, Fig. 5, Plate II.

But in the size of bar I have used for a 4 x 6 foot skylight the use of the cap plate *c c* is not considered necessary, as the bar can be made sufficiently strong by being

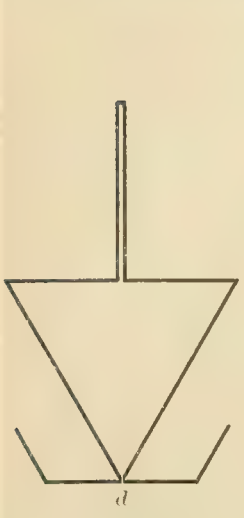

Fig. 1

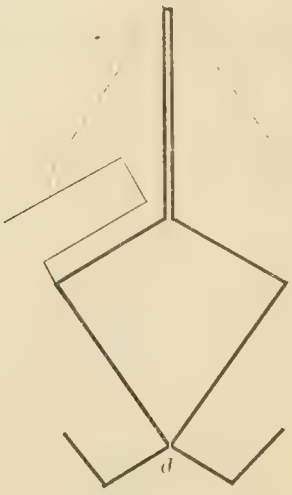

Fig. 2

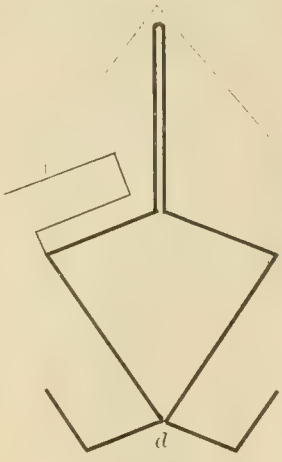

Fig. 3

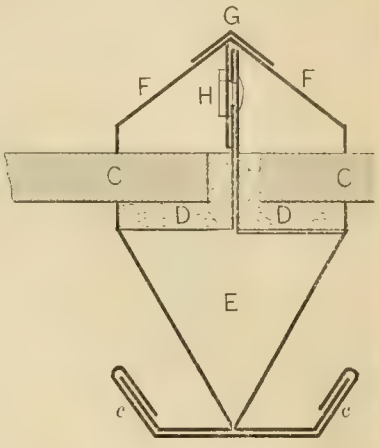

Fig. 5

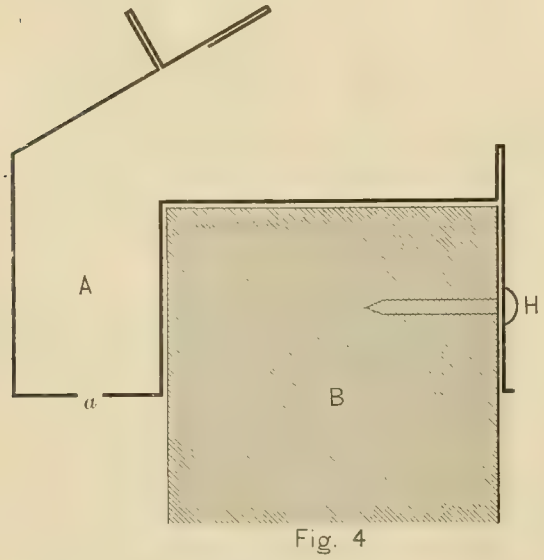

Fig. 4

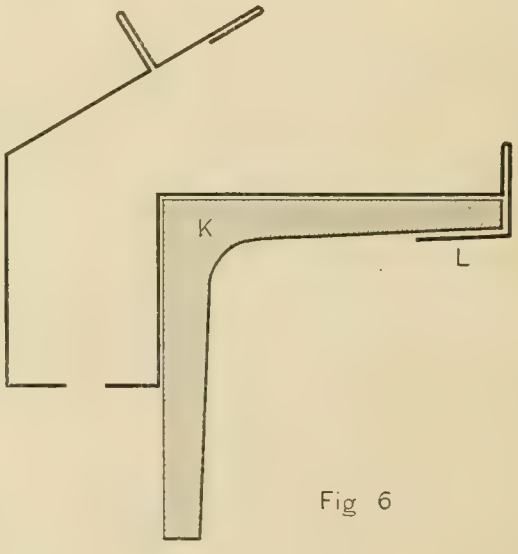

Fig 6

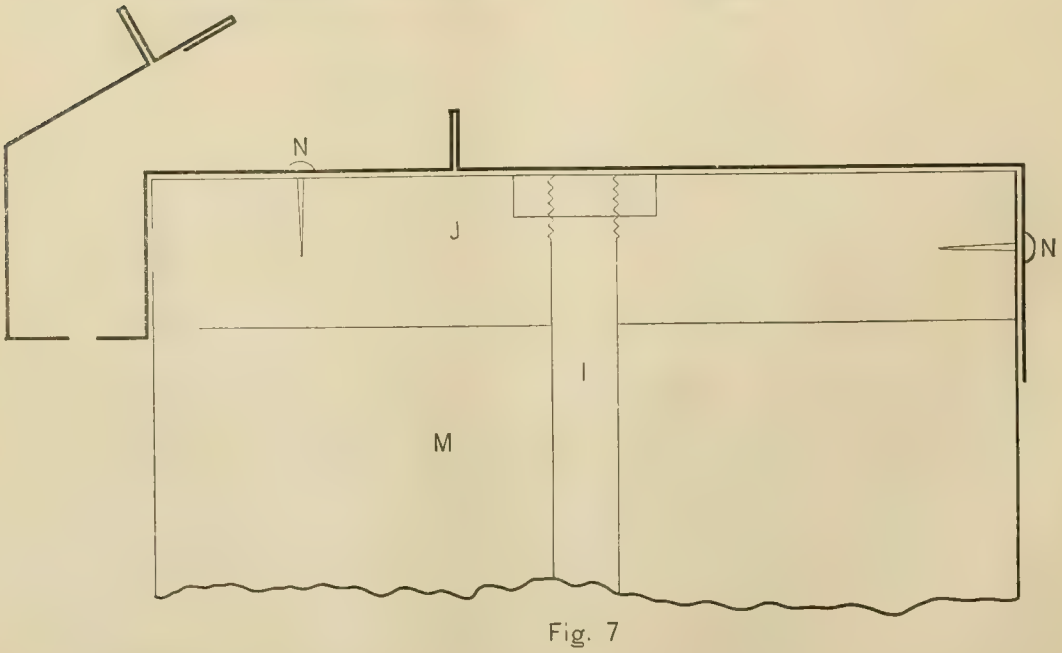

Fig. 7

PLATE II.—SECTIONAL VIEWS OF AND CURB.—(FULL SIZE.)

soldered at the point *d*, where the two sides of the bar come together, as shown in Figs. 1, 2 and 3 on Plate II.

PLATE II.—SECTIONAL VIEWS, FULL SIZE, OF THE CURB AND BARS USED.

On this plate we have represented the full-size section of the various parts we have adopted in the construction of a skylight of this size and character. Fig. 1 represents th side bars as shown on Plate I, Fig. 1, by C, D, E and F. Fig. 2, on this plate, is the ridge bar, Fig. 3 the hip bar and Fig. 4 the curb. B, in Fig. 4, is the full-size section of wooden curb, on which the skylight is presumed to set, and A, in Fig. 4, is the iron curb or base of skylight, which

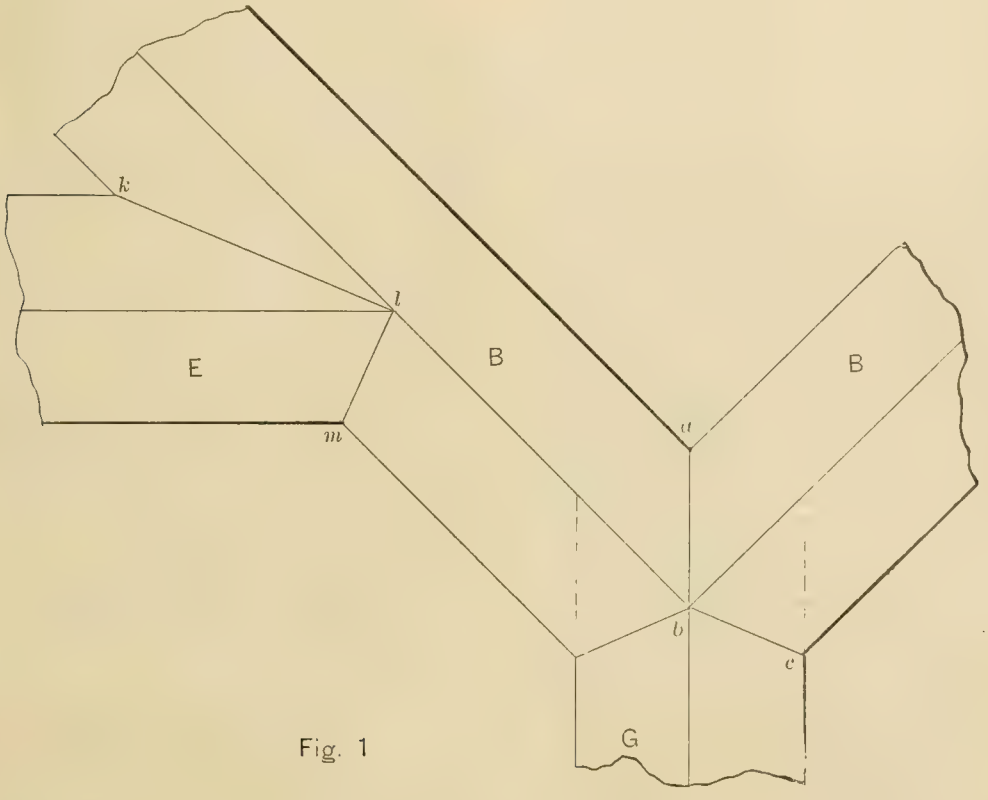

Fig. 1

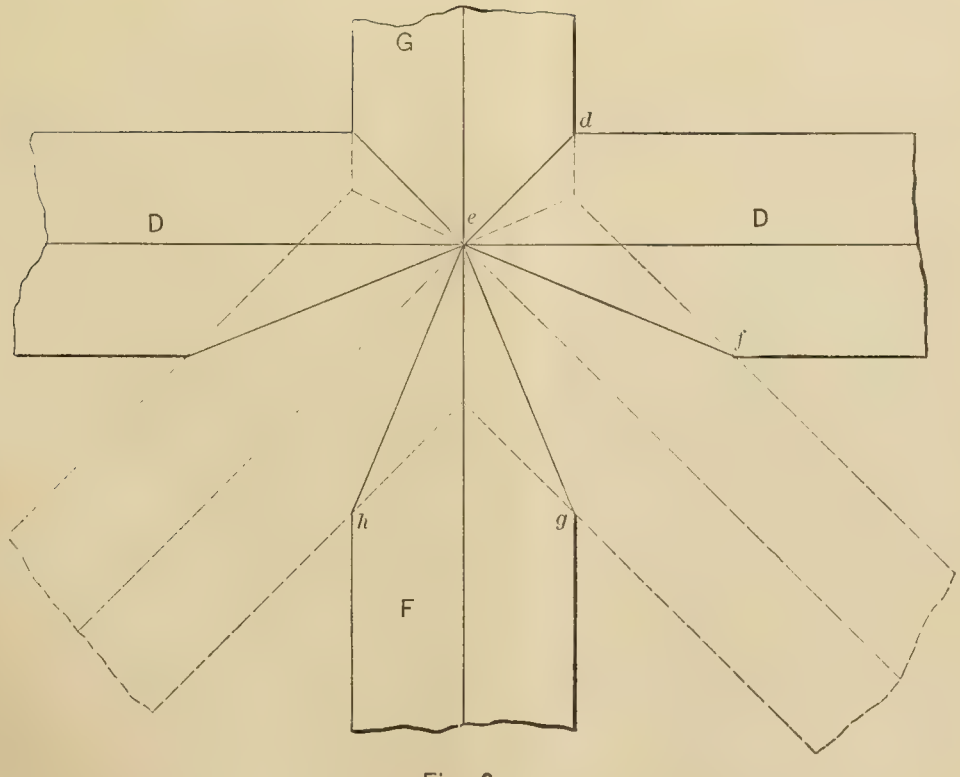

Fig. 2

PLATE III.—PLAN OF MITERS AT TOP OF BARS.—(FULL SIZE.)

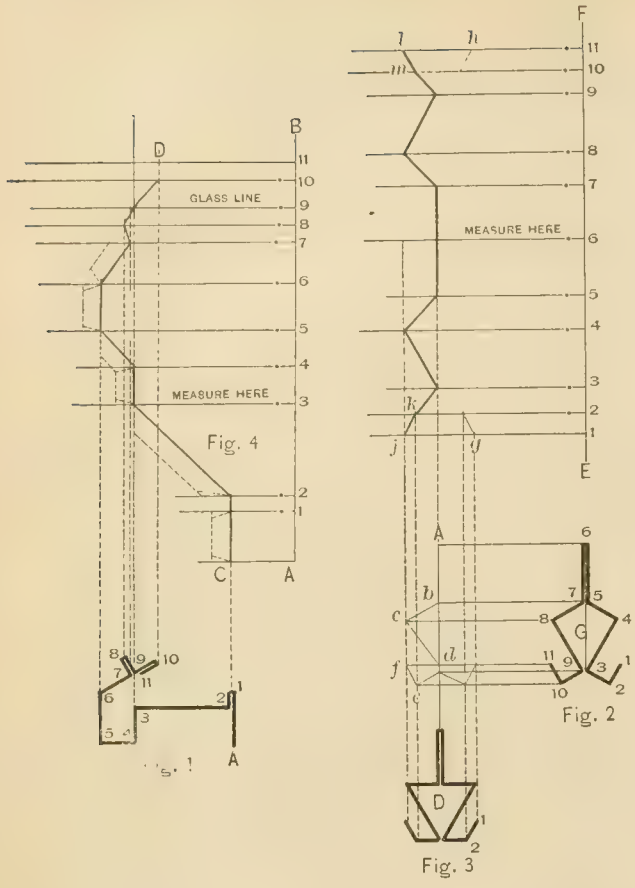

PLATE IV.—DEVELOPMENT OF CURB AND RIDGE MITERS.—
(ONE-FOURTH SIZE.)

turns down on the inside of wooden curb and is nailed to same at point H, thus avoiding the necessity of any nailing on the outside of curb.

At point *a* in bottom of gutter in metal curb A make a perforation of holes ¼ inch in diameter placed at intervals of about 6 inches around the entire curb of skylight, for carrying off all condensation that may gather on the under side of the glass.

Fig. 5 represents sectional view, full size, of complete construction of bar when glazed. E represents the bar as shown in Fig. 1. F is the cap, C C the glass, D D the putty. G represents the cleat that holds the cap F on the glass, being riveted to bar E at point H, and is passed up through the top of the cap F. That portion that passes up through the cap is split in the center and turned down on cap as shown, half on one side and half on the other. This cleat is made of copper ¾ inch wide and placed about 3 inches from the bottom of bar. The top ends of caps are soldered where they join each other and do not require cleats at top except the bar is longer, but in the ordinary size skylight the one cleat at the bottom is generally considered, I believe, sufficient. Fig. 6 shows how the curb may be secured to an angle-iron frame. K is the angle iron and the curb is secured to the same by being turned down under the angle iron at L.

Fig. 7 shows one method of constructing the curb where it rests on top of a brick wall. M is the brick wall, I are iron rods built in the wall with nuts at top to securely fasten the board or plank J to the wall, and the metal curb is fastened to this board by means of nails, N N.

PLATE III.—PLAN OF TOP MITERS.

On this plate we have shown ground plan, full size, of the intersecting points or miters at top of the bars B, E, D and F.

In the top section, Fig. 1, we have simply shown the intersection of hip bars B B with ridge bar G; *a b c* represents the ground plan of miter desired. On this same ground plan we have shown top miter for the E bar, which is represented by *k l m*.

In the lower section, Fig. 2, the intersection of the hip bars B B with ridge bar G is represented by dotted lines, and the intersection of bars D D and F with hip bars and ridge is represented by solid lines; *d e f* shows the ground plan of miter for the bar D, and *e g h* the ground plan of the miter for the bar F.

We have made this distinction because in constructing the skylight and putting it together the hip bars B B are the first to be set in place in connection with the ridge bar G, and the bars D D and F are mitered into them.

PLATE IV.—DEVELOPMENT OF CURB AND RIDGE MITERS.

Fig. 1 represents a section of the curb or base to skylight. On line A B, which is drawn perpendicular to the base of curb, lay off the stretchout of the curb, making the distance between points A 1, 1 2, 2 3, &c., equal in length to the same points as shown in Fig. 1. That is, make A 1 in line A B equal in length between points, as between A 1 in Fig. 1, and the distance between 1 2 equal in length to the distance between corresponding numbers in Fig. 1, and thus continue the process until the full stretchout of curb is obtained and laid off on the line A B. At these various points, A, 1, 2, 3, &c., thus obtained, draw lines at right angles with A B, intersecting the same with dotted lines drawn from corresponding figures in the curb, as shown in Fig. 1. Connecting these points of intersection with lines drawn between them, we have the miter of the curb C D. In laying off the full length of pattern of curb, mark off the distance between bars, both on the side and end pattern, with a prick mark on glass line, as shown in Fig. 1, in order to show where to set the bar in putting the frame together. In this case the distance between points is 12 inches.

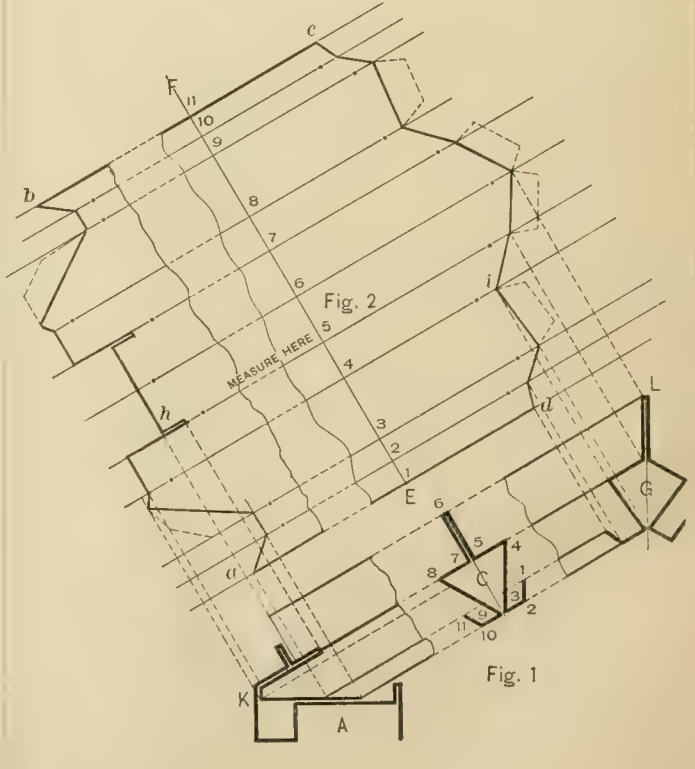

PLATE V.—PATTERN FOR SIDE BAR C.—(ONE-FOURTH SIZE.)

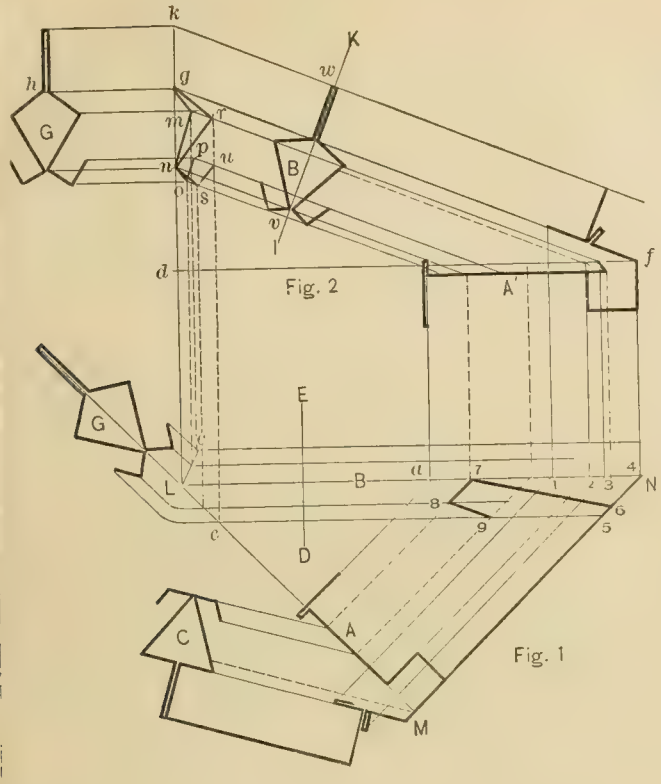

Fig. 1

and we have *a b* as the development of the miter at the curb end of the bar, and *c d* as the development of the miter of the bar at the top where it intersects with the ridge bar G.

PLATE VI.—DEVELOPMENT OF HIP BAR AND MITERS.

The development of the shape and form of the hip bar, and the intersecting points of the top and bottom miter to same.

Fig. 1 represents a portion of the skylight, showing the ground plan and intersecting points of hip bar B at top with ridge bar G, and its connection at lower end with the curb. Let the angle L M N represent one-half of the end of the skylight. On the line L M construct the curb A, with its front or gutter end resting on line M N.

With L M as the base line of curb construct the side rafter C, with its intersecting points at curb A, as already illustrated in Fig. 1, on Plate V.

At all points where the lines drawn from the angles in side bar C intersect with curb A draw lines parallel with M N, and continue them until they intersect with corresponding lines drawn from the angles of the ridge bar G. These lines thus drawn from the angles of the ridge bar, from their intersection with the hip bar B, are carried parallel with L N to their point of intersection at the curb with the lines drawn from the side bar C. Drawing lines between points, we have 1, 2, 3, 4, 5, 6, 7, 8, 9, representing one-half of the ground plan of the curb miter of the hip bar.

As Fig. 2 is to represent the elevation of the hip bar B with its intersecting points at the top with the ridge bar and at the bottom with the curb, to secure this we first lay off the angle *d f g*, corresponding with angle as shown by *b c o* in Fig. 1, Plate 1.

On the base line *d f*, of this angle *d f g*, which is drawn parallel with L N in Fig. 1, we construct the curb A', which gives us the elevation of the curb on the miter line.

PLATE VI.—DEVELOPMENT OF HIP BAR AND MITERS.—
(ONE-FOURTH SIZE.)

Fig. 2 represents a section of the ridge bar G, showing end miter of same where it joins the hip bar B. In Fig. 4 draw the line E F, at right angles with A 6 in Fig. 2. On the line E F lay off the points 1, 2, 3, 4, &c., equal in distance between points, as between the corresponding numbers 1, 2, 3, 4, &c., in section of ridge bar G, as shown in Fig. 2, thus giving us the stretchout of the bar. At these various points draw lines at right angles with E F, and intersect them with dotted lines drawn at right angles with A 6 in Fig. 2 from points A *b c d e f* where the ridge bar intersects with hip bar B.

In this skylight, as we have the side bar D intersecting at point A with bars G and B, it is necessary to cut away that portion of the pattern in Fig. 4 as shown by dotted lines *g j k* and *h l m*, in order that that portion of the gutter of the ridge bar, as shown in section by 1 2 and 10 11, may intersect with and miter the same points in side bar D in Fig. 3.

PLATE V.—PATTERN FOR SIDE BAR C.

Fig. 1 represents the elevation of the bar C, showing its connection with curb A at the bottom and ridge bar G at the top, and all its various points of intersection with same.

Draw line E F at right angles with pitch of bar, as shown by K L in Fig. 1. On this line, E F, lay off the stretchout of the bar, as shown by the figures 1, 2, 3, &c., making the distance between 1 and 2, 2 and 3, &c., equal in length to the corresponding figures on section of bar C in Fig. 1. From these points, 1, 2, 3, &c., thus obtained on the line E F draw lines through them at right angles with E F, and of sufficient length on both sides of the line to be intersected with dotted lines drawn at right angles with K L and from intersecting points of bar C with curb A and ridge bar G in Fig. 1.

Draw lines between the intersecting points of the dotted lines with the solid lines, drawn at right angles with E F,

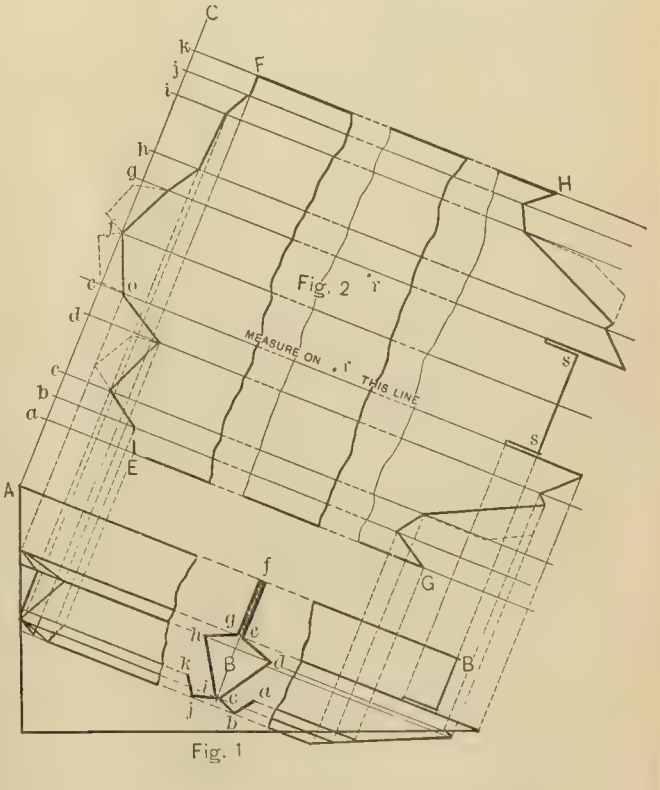

Fig. 1

PLATE VII.—PATTERN OF HIP BAR.—(ONE-FOUTRH SIZE.)

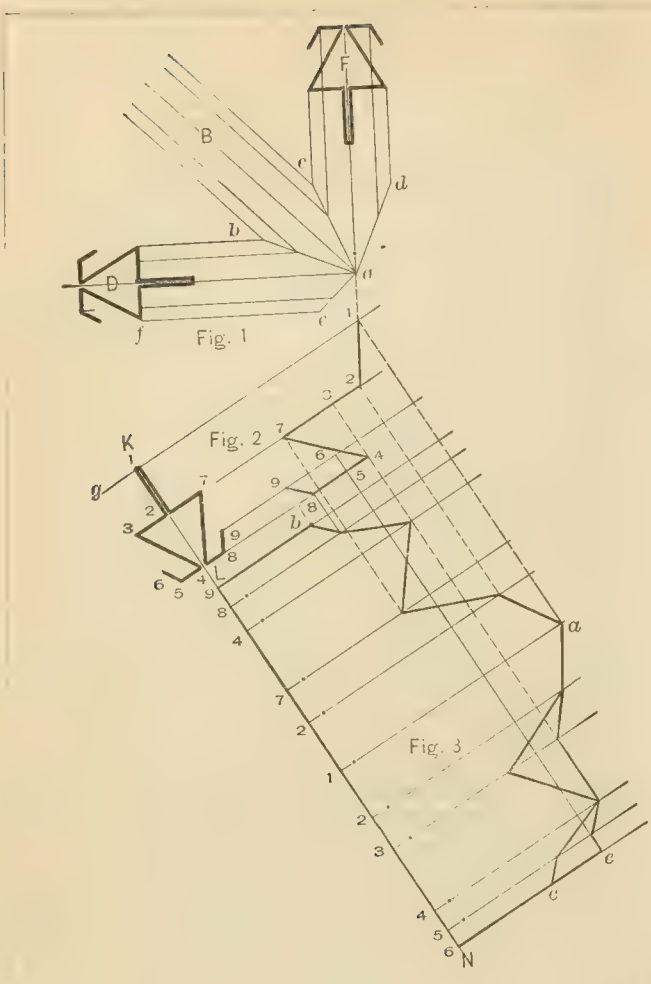

PLATE VIII.—TOP MITERS FOR D AND F BAR.—(ONE-FOURTH SIZE.)

The solid lines drawn to curb A' from miter line *a* N on L N in Fig. 1, and at right angles with the same, show points of projection of the curb. The hight of curb at its various points is the same as corresponding points in curb A of Fig. 1.

The dotted lines drawn from 1, 2, 3, 4, &c., on this same line, *a* N, and at right angles to it, and extended to curb A' in Fig. 2, give us the different points of projection of the hip bar on the curb.

In order to secure the proper points in the miter at the top of the bar B, we will first continue the line *f g* until it shall intersect with a line drawn from the point L, and at right angles with L N in Fig. 1. Then at *g*, in Fig. 2, draw the line *g h* at right angles with *g d*, and at *h* construct a section at the ridge bar G. From the various angles of this bar thus obtained draw lines parallel to *h g* and intersect them with the dotted lines drawn from the miter *c* L *e* in Fig. 1, and by connecting the points we have *k g m n o p* as the miter line in the elevation of the hip bar at the top. From these various points thus obtained draw lines parallel to *g f* to the curb, when they will intersect points already secured from corresponding angles in side bar C in Fig. 1.

This gives us all the lines in the elevation of the bar. We are now prepared to construct a section, or shape, of the hip bar. But before doing so there is another top miter to be shown in the elevation of the hip bar B, which is *k g r n s u*. This is obtained by dotted lines drawn from the ground plan of the miter, as shown by L *e* in Fig. 1 at right angles with L N and intersecting corresponding lines in the elevation of the bar in Fig. 2, and by connecting the points it gives us, as stated, the miter line *k g r n s u*.

To construct the hip bar draw I K at right angles with *f g*, the pitch of bar. V W on line I K gives us the full hight of the bar and all intermediate lines crossing the line I K gives us the hight of the bar at the various angles. The width of bar is shown at D E in Fig. 1. To construct the shape of the bar we simply make the width of the bar at the various points on line I K correspond with the width of same, as shown on lines between D E in Fig. 1, or as shown by width of ridge bar G at its various angles.

PLATE VII.—PATTERN OF HIP BAR.

Fig. 1 represents the elevation of hip bar B, showing top or ridge miter and bottom or curb miter, as already developed in Fig. 2 on Plate VI.

To secure the pattern of this bar, first draw line A C from point A in top of elevation, Fig. 1, and at right angles with A B, the pitch of the bar, and on this line lay off the stretchout of the bar.

Make the distance between points *a*, *b*, *c*, *d* and *e* on line A C in Fig. 2 correspond in length to the same distance between *a*, *b*, *c*, *d* and *e* as shown in section B on Fig. 1, and we have *a k* on line A C as the full width, or stretchout, of pattern required.

From these various points of the stretchout of the bar thus obtained draw lines at right angles with the line A C, and of sufficient length to be intersected with dotted lines drawn at right angles with A B and from points in the top and curb miter, as shown in Fig. 1.

Connecting the points thus obtained, we have E F as the developed pattern for the top or ridge miter, and G H as the development of the lower, or curb, miter pattern.

The measure for the length of the hip bar is to be taken on the glass, or curb line, as shown on pattern by *o s*, Fig. 2, and equal in distance from *c* to *o*, as shown in Fig 1, Plate 1; *r r* on pattern, Fig. 2, show points to be marked on pattern of intersection of side bar E at the top, as shown at *e* in Fig. 1 on Plate I. Hence the distance *s r* on the pattern, Fig. 2, is the same as *c s* on line *c o* in Fig. 1, Plate I.

PLATE VIII —TOP MITERS FOR D AND F BAR.

Fig. 1 shows the ground plan and Fig. 2 the elevation of the miter. Starting with the ground plan and taking *e f* as the level line, we lay off the line *i g* at convenient dis-

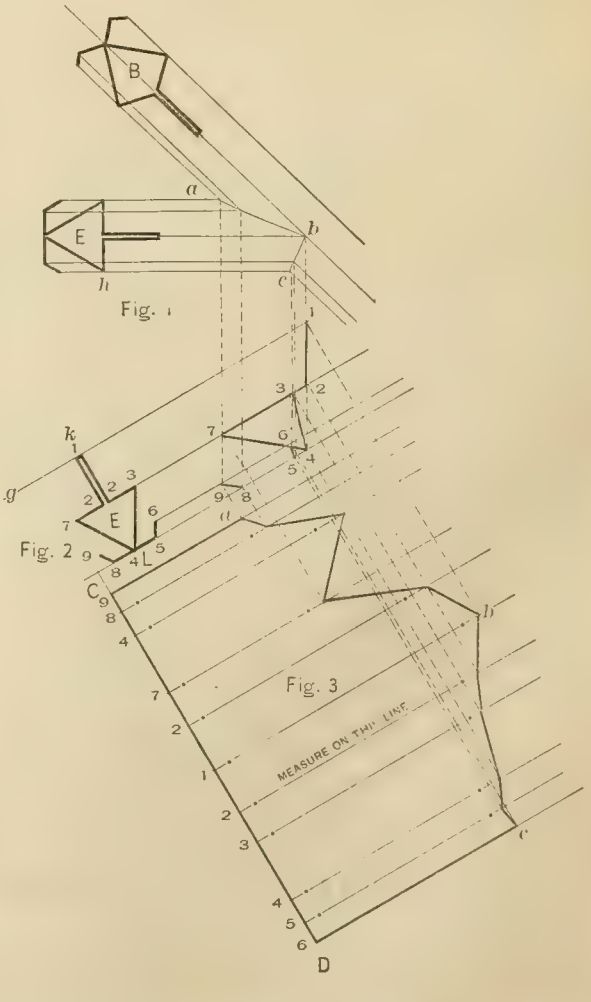

PLATE IX.—TOP MITER FOR THE E MOLD.—(ONE-FOURTH SIZE.)

tance from it and on the pitch of skylight, as shown by *f h* in Fig. 2, Plate I. Draw *k l* at right angles with *i g*. Construct the elevation of the bar D. At the various angles of the bar thus obtained draw lines parallel to *i g*, intersecting them at top with dotted lines drawn at right angles with *e f* in Fig. 1 and from points on the ground plan miter, as shown by *e a b*, said points in ground plan having been established by lines drawn from the angles in the section of bar D, in Fig. 1. Connecting the points thus obtained in Fig. 2, we have 1 2 3 4 5 6, as the form of miter in elevation of which *e a* in Fig. 1 is the ground plan, and 1 2 7 4 8 9 is the elevation of the miter of which *a b* in Fig. 1 is the ground plan. As *a c* and *a d* represent the same miter in the ground plan, as *e a*, the same elevation of the miter applies alike to all, so that the elevation of miter

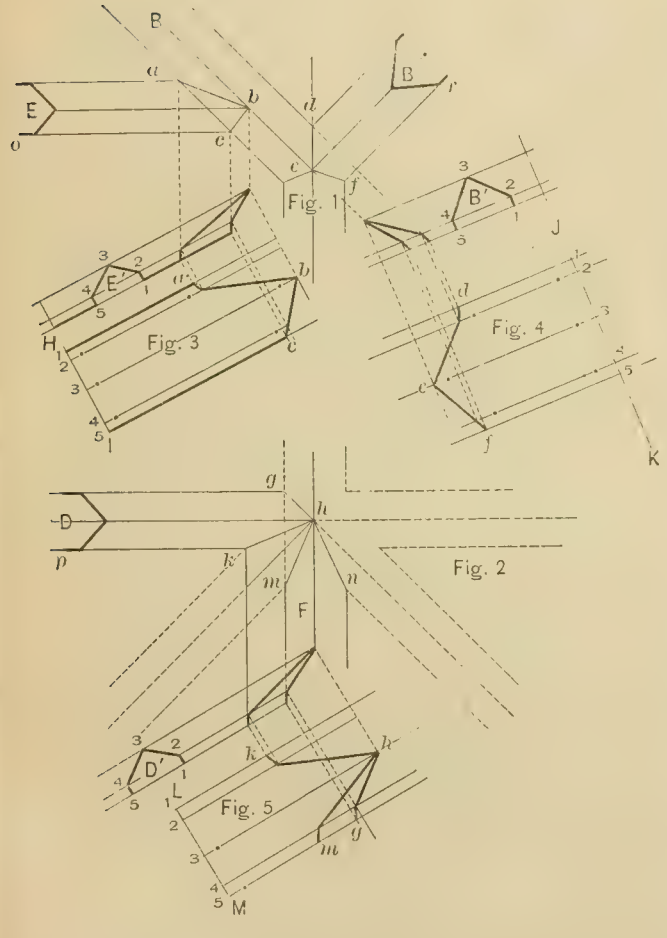

PLATE X.—DEVELOPMENT OF CAP MITERS.—(ONE-FOURTH SIZE.)

1 2 7 4 8 9, developed from the ground plan *a b*, will be the same for *a c* and *a d*.

Having procured the form of the miter in elevation we proceed to lay off the miter. Draw line L N at right angles with *i g*, and proceed to lay off the stretchout of the bar, making all distances between points 9, 8, 4, 7, &c., on line L N in Fig. 3 to correspond to distance between same points 9, 8, 4, 7, &c., as shown in section of bar D in Fig. 2. From these points on line L N, and at right angles to it, draw lines parallel with *i g* of sufficient length to intersect the dotted lines drawn at right angles to *i g* in Fig. 2, and from the points in the elevation of the miter 1, 2, 3, 4, &c., and we have *b a e* in Fig. 3 as the developed miter of the D mold, as shown in ground plan *b a e* in Fig. 1. As *a b* is the same as *a c* and *a d*, *b a c* in Fig. 3 is the developed miter for the bar F, as shown by ground plan *c a d* in Fig. 1.

Use the same curb miter for these bars D and F as already developed for bar C on Plate V.

PLATE IX.—TOP MITER FOR THE E MOLD.

In Fig. 1 we have reproduced that portion of Fig. 1 in Plate III which shows the intersection in ground plan of the bar E with the hip bar B; *a b c* on plan represents the miter. Draw lines from all the angles in bar E, and parallel with *c h*, to the miter line *a b* and *b c*, as shown. Having thus secured all of the points of intersection of the miter on the ground plan *a b c*, we proceed to develop these intersecting points of the miter in the elevation of the bar, the same as for bars D and F on Plate VIII.

With *c h* as a level line lay off the line *i g* at a convenient distance from it and on pitch of skylight, as shown by *f h* in Fig. 2 on Plate I.

At point *k* on line *i g* in Fig. 2 draw *k l* at right angles with it. On this line *k l* construct a section of the elevation of the bar. Through the various points or angles on this bar, E, draw lines parallel to the line *i g* and of sufficient length so that they can be intersected, with dotted lines drawn at right angles with *c h* in Fig. 1, said dotted lines to be drawn from the various intersecting points on the ground plan *a b c* of the miter. Connecting the points we have, in Fig. 2, 1 2 3 4 5 6 as the elevation of the miter for which *b c* in Fig. 1 is the ground plan. 1 2 7 4 8 9 is the elevation of the miter of which *a b* in Fig. 1 is the ground plan. From this elevation of the miter we proceed to lay off the pattern. Draw C D at right angles with *i g*, and on this line lay off the stretchout of the bar, making all distances between 9, 8, 4, 7, &c., on line C D in Fig. 3 to correspond in length with the same points 9, 8, 4, 7, &c., as shown in section of bar E in Fig. 2. From each of these points, 9, 8, 4, 7, &c., in Fig. 3, draw lines at right angles to C D, and of sufficient length to intersect with the dotted lines drawn at right angles with *i g* in Fig. 2 and from the various points in the elevation of the miter. Draw lines between points of intersection thus obtained and we have *a b c* in Fig. 3 as the developed pattern of the miter. The lower or curb miter of this bar is the same as that already developed for the bar C on Plate V.

PLATE X.—DEVELOPMENT OF CAP MITERS.

Development of cap miters at points of intersection at top, the lower or bottom end of cap being cut square end.

The ground plan of the caps for the various bars, as shown in Fig. 1 and Fig. 2, are the same as for the bars, being the same in width. The full size and form of the caps for the various bars are already indicated on Figs. 1, 2 and 3, Plate II. E, B, D and F in Fig. 1 and Fig. 2 give us the shape or section of cap for the various bars, as the letters indicate.

E, as shown in Fig. 1, is the cap for the E bar that intersects and miters the cap for the hip bar B at the points *a, b, c*. The method of securing the pattern of this cap is the same as that of securing the pattern of the E bar, by dropping dotted lines from this miter *a b c* at right angles with *o c*, until they intersect solid lines drawn from E', the elevation of the cap on the pitch of the skylight. This gives us points of projection of the miter in the elevation E' from which to develop the pattern of the cap. First draw the line H I at right angles with the pitch of cap E' and on this line lay off the stretchout of the cap, making the distance between points 1, 2, 3, 4, 5 on line H I equal in length to 1, 2, 3, 4, 5 on section of cap E'. From these various points and at right angles to H I draw lines of sufficient length to intersect dotted lines from points of projection of miter in the elevation, and by connecting the points we have *a b c* in Fig. 3 as the developed pattern for the cap for the E bar.

The pattern for the cap for the hip bar B is obtained in practically the same way as the cap for all the other bars, with the exception that the pitch or elevation of the cap, instead of being the same angle is as we have already shown and explained by *c o* in Fig. 1, Plate I. But the base line of the pitch or elevation of this cap is parallel with the line *f r* in ground plan B. On this angle construct the pitch or elevation of the cap B', drawing lines through the various angles of this cap parallel with the pitch of same and intersect them with dotted lines drawn at right angles with *f r* in ground plan and from points *d e f* o_f

miter. At right angles with elevation B' draw the line J K and on this line construct the stretchout of the cap, making the distances between the points 1, 2, 3, 4, 5 on this line J K the same as between corresponding points 1, 2, 3, 4, 5 in section B'. From these points draw lines at right angles to J K and intersect them with dotted lines drawn from miter points already obtained in the elevation. Connecting the points, we have *d e f* in Fig. 4 as the developed pattern.

In Fig. 2 we have the intersecting miters of the D and F cap with the hip and ridge; *g h k* is the ground plan of the miter for the D cap and *m h n* the ground plan of the miter for the F cap.

Construct the elevation of the cap D' the same as for the cap E, drawing lines through the angle of section D' in elevation and parallel with pitch or elevation, and intersect them with dotted lines drawn at right angles with *p k* in ground plan and from the intersecting points or miter *g h k*. Connecting the points, we have the projection of the miter in the elevation. We next draw the line L M at right angles with the pitch of cap D', and on this line lay off the stretchout of the cap, as shown by 1, 2, 3, 4, 5 in section of D', making 1, 2, 3, 4, 5 on line L M the same distance between points, thus giving the full width of the pattern required.

From these various points draw lines at right angles with L M and intersect them with dotted lines drawn at right angles with pitch of cap and from points established in the elevation of the miter. Connect the points and we have *k h g* in Fig. 5 as the developed pattern for the D cap.

As the angle *h m* and *h n* in cap F are the same as *h k* in cap D, we make *h m* the same as *h k* in Fig. 5, or *k h m* as the pattern for the F cap miter *h m n*.

FLASHINGS.

In an elaborate edition of the Erie *Evening Herald* for September 14 notices are given of the local industries of greater prominence, among which is a reference to the Flickinger Roofing & Cornice Company, located at 408 West Eighteenth street, Erie, Pa. The firm started in business in 1891, and the main shop is 40 x 80 feet, with an additional building 20 x 50 feet, and from 15 to 20 skilled workmen are employed. The president of the concern is C. Flickinger; secretary and treasurer, W C. Shutte, and superintendent, U. S. Swiegard. In addition to making all kinds of sheet-metal work for roofs and cornices, they also, it is stated, handle the Prince Royal hot-air furnaces, the merits of which are alluded to.

Benoit Baillot Detombay of Chérée, Belgium, has secured patents in Belgium, France and the United States for an improvement in sheet-metal roofing, which is preferably made of zinc. The sheets are formed with a number of M shaped ribs extending lengthwise, and tongues are secured along the edges of each sheet in such a manner that one sheet will interlock with another. Similar tongues are secured under one end of each sheet, so that as the sheets are being laid the upper sheet will interlock with the lower. The upper end of each sheet is secured to the roof by nails which are driven through countersinks, thus preventing the nail heads from coming in contact with the upper sheet, which laps sufficiently to cover the nail heads. The ends of the sheets are bent slightly so as to form a close joint.

The Cortright Metal Roofing Company, Philadelphia, Pa., prepared especially for distribution at the World's Fair *fac-simile* samples of their well-known Victoria sheet-metal shingles. We understand from the company that they still have a considerable supply of these souvenirs on hand, and will be glad to mail a set of them to any address on request. The minature shingles are 2½ x 3½ inches in size, and are finished in brown Japan paint, giving them a very pleasing appearance. They furthermore reproduce exactly the characteristics of the large shingle, so that the merits of the regular goods can be investigated thoroughly in the small editions.

Niles, Ohio, is rapidly developing into an important center of the iron and steel roofing trade. The latest concern added to the list is one under the control of C. B. Cill of the Chicago Roofing Company, Chicago, Ill. It will probably cause as much surprise among roofers as it did among the citizens of Niles. Nothing was publicly known of the enterprise until Tuesday, September 5, when three acres of ground adjacent to the Russia Mill were purchased and grading commenced the same day. The building, 200 x 60 feet, is now in course of erection. It is stated that 25 men will be employed. The other roofing manufacturers at Niles are: Sykes Iron & Steel Roofing Company, Niles Iron & Steel Roofing Company, Curtis Steel Roofing Company, Niles Spouting & Roofing Company, all of whom are doing good business. Another sheet-metal working concern at Niles is the Niles Mfg. Company, makers of Galvanized eave trough, conductor pipe and patent plastering lath. There are seven sheet mills in this vicinity to supply the demands from these factories.

The American Roofing Company, St. Louis, Mo., report an increased trade. They are shipping a number of carloads to the Pacific Coast, and a carload of iron to the Cherokee Strip. Their business for the year is keeping up remarkably well considering the condition of business throughout the country, and from the way inquiries are now being received their fall business will compare favorably with that of last year.

The Vermont slate quarries controlled by the Slate Trust will be shut down for the winter after October 1 in order to reduce the output.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until October 12 for all the labor and materials for the roof sheathing, slate and copper work of roof, down and drain pipes, &c., for the United States Custom House and Post Office building at Newark, N. J. Drawings and specifications can be obtained from the superintendent at Newark, N. J., or at the office of the Supervising Architect at Washington.

The very dry weather has caused disastrous forest fires in many parts of the country. Northern Wisconsin appears to have suffered most severely from this cause. Last week all Northern Wisconsin was one smoldering furnace, millions of dollars' worth of property having been destroyed. Great tracts of valuable timber land have been laid waste and towns have been wiped out of existence. Traffic on the Wisconsin Central Railroad was suspended owing to burned bridges. Rain only will check further and perhaps more serious damage.

SCRAP.

The total exports of tin plates and sheets from Great Britain to the United States during the first eight months of the present year were 198,452 tons, against 191,992 tons in the eight months ending August 31, 1892, an increase of nearly 6500 tons. Owing to the depreciation in price of this material, however, the increase in value of exports does not show a proportionate increase. In the month of August exports of tin plates to this country fell off very considerably, due largely to the financial depression existing on this side, which prevented importers from placing large orders with Welsh makers. The expectation of a possible readjustment of the tariff in the near future has also had a share in the unwillingness of American merchants to increase their stocks of imported tin plates. The figures showing shipments of tin plates from British ports to the United States in August are given in the Board of Trade returns as 15,784 tons, valued at $992,528, against 24,221 tons of the value of $1,511,367 exported in August, 1892.

Up to the present time tin ore has been found to a large extent in Cornwall, and to a more limited degree in Spain, France, Finland, Greenland, Sweden, China, Australia, and in both North and South America. The richest and most extensive deposits of the metal yet discovered are, however, in the Malay Peninsula and its neighboring islands.

A press dispatch from Ellwood, Ind., dated September 19, states that the large works of the American Tin Plate Company are running to their utmost capacity, and yet the concern is unable to keep pace with the volume of orders for their tin plates.

The black-plate mills of the New Castle Steel & Tin Plate Company, New Castle, Pa., are now completed and everything is ready for operations. The engines and roll trains have been running several weeks and have got down to their bearings. The tinning department is nearly completed. It is probably that this plant will be put into operation as soon as the steel plant of the Shenango Valley Steel Company starts up.

George H. Ismon, New York sales agent of the Falcon Iron & Nail Company, has received from that mill, as samples of their stock, some very handsome Bessemer steel sheets, cold rolled. They include regular tinning sheets 14 x 20 inches, and sheets 14 x 28 inches 0.013 inch thick. The Falcon Iron & Nail Company make sheets to 29 and 30 gauge up to 30 inches wide and 96 inches long.

STEAM AND HOT WATER.

The Springfield Coil Boiler.

The two illustrations shown herewith present views of the Springfield coil boiler, made by the Springfield Coil Boiler Company, 48 Hampden street, Springfield, Mass. Fig. 1 is an outside view of the boiler incased in brick, while the boiler proper is shown in Fig. 2. These boilers are made according to the Waterhouse patent, and, we understand from the company, have been tested during the past five years.

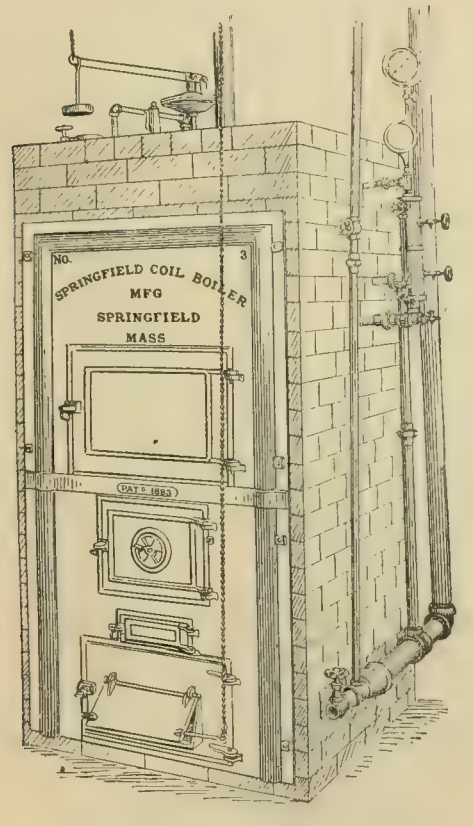

Fig. 1.—Boiler in Brick Setting.

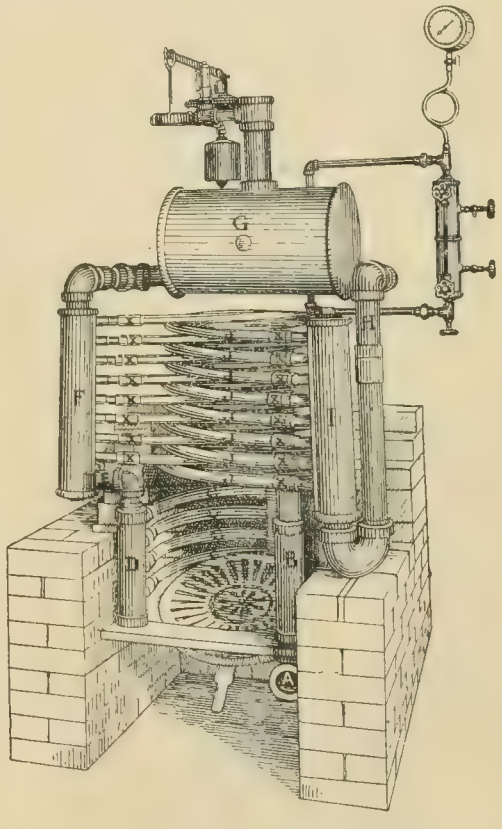

Fig. 2.—Boiler without Setting.

THE SPRINGFIELD COIL BOILER.

The pipe used in them, it is said, is made 25 per cent. thicker than ordinary pipe, and is coiled by new and improved machinery. Special claims are put forward for the circulating feature of the boiler, which makes it heat much more rapidly. Referring to Fig. 2, the water enters the boiler at A, being the point of filling and also where the returns come in. Thence the water enters the fire-pot standard B, circulating around the fire pot C to the other standard D. Through E it reaches the standard F, leading to the steam drum and water chamber G. A special feature of the apparatus is the standard H, through which the water circulates on the return to the coil standard I, then through the circulating coil J to the standard F, which completes the circuit. It is pointed out that there is a continual and uninterrupted circulation going on through all parts of the boiler as long as heat is applied, which prevents the formation of crust in the pipe. The coils J are 18 feet in length, or longer, according to the size of the boiler. These lie flat over the fire, one above another, and are of any number and size required. As indicated at X, any coil can be taken out or replaced at small cost by an ordinary fitter. The boilers are furnished with the usual trimmings. The grate is a feature for which a patent has been applied, being double acting and center shaking. The center of this grate turns faster than the outside and in the opposite direction.

HEATING NOTES.

The H. R. Barker Mfg. Company, Lowell, Mass., issue a neat circular of the Richmond steam and hot water heaters, which they handle and install. The circular is bound in dark orange paper and the letterpress within will be of interest to the heating trade. It gives careful information concerning the extensive line of Richmond heaters, the text being illustrated with numerous general and sectional engravings. Full tables of prices and sizes also accompany the illustrations, and at the end reference is made to a variety of radiators. At the close is a list of references of users of Richmond heaters in Lowell and vicinity.

Among the recent contracts taken by representatives of the J. F. Pease Furnace Company, Syracuse, N. Y., or their local agents for furnishing Economy heaters are the following: Three hotels at Carthage, N. Y.; hotels at Binghamton, Roscoe and Fayetteville; schools at Amsterdam and Windsor, N. Y., and New Milford, Pa.; church at Penn Argyle, Pa.; hospital at Newark, Ohio, and block at Carthage, N. Y. They have also orders for steam, hot-water and combination heaters for 34 different residences in different cities of New York State, and some in Ohio and Pennsylvania.

The Nashville Machine Company, Nashville, Tenn., report that in spite of the dull times and bank failures their trade is proving satisfactory. They are looking forward to a large fall business, particularly in the G. & J. R. Bolton hot-water heaters, which they manufacture. They have a number of inquiries, and are constructing some of their largest sizes for the Western trade. They carry a large stock on hand and can supply all orders on short notice.

E. N. Squires returned home to Geneva, N. Y., quite recently, after a successful business trip during which he sold 14 large-size Dunning boilers, all for heating Government buildings. Mr. Squires is a well-known feature of the New York Central

Iron Works Company, and is well able to chant the praises of the Dunning boiler.

J. G. ZELLER of Richmond, Ind., has been selected as one of the experts to decide upon the plan of steam heating to be adopted for heating an asylum in Ohio.

IN A RECENT ISSUE of the *Daily Courier Post* of Hannibal, Mo., there is a published correspondence respecting the Novelty Circulator, which indicates that this boiler has given excellent results when in use.

A PAMPHLET entitled "The Fowler Boiler: What It Is and Where to Get It," is a neat publication issued by the Fowler Boiler Company of Providence, R. I. These boilers are intended for various purposes. In addition to those designed more especially for marine and stationary boilers and yacht engines, the boilers are also made for house heating. They are described as very strong and extremely economical in fuel consumption. The form of the apparatus is also well adapted for combination heating and power purposes. The boiler consists essentially of vertical annular waterways made of large and small tubes, grouped around a larger central water space of the same design. Special attention is called to the double jacketing of the boilers and asbestos lagging for preventing waste of heat.

ARTICLES OF INCORPORATION under the laws of Illinois have been secured by the Samuel I Pope Company, at Chicago; capital stock, $60,000; manufacturers and contractors of steam heating apparatus; incorporators, Samuel I. Pope, Charles H. Ralton and William A. Pope. The company will take over the business now conducted by Samuel I. Pope & Co. at 360 Dearborn street, Chicago.

THE CAPITAL STOCK of the Baker & Smith Company, 193 to 197 Van Buren street, Chicago, has been increased from $150,000 to $200,000.

Prouty's Wire Valve Wheels.

N. H. Prouty, Charlton City, Mass., is introducing wire valve wheels, as shown in the accompanying cuts. As seen in Fig. 1, the wheel consists of a metal hub plate surrounded by coiled

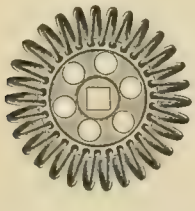

Fig. 1.—Wire Valve Wheel.

wire, all nickel plated. The manufacturer refers to the combination of the coiled wire and the hub plate being such as to give a strong, rigid wheel, a good grasping surface for wet or greasy hands, and as presenting a pleasing appearance to the eye, and states that they are always cool. The point is made that these wheels are not open to the objection of warping and splitting off, as wooden wheels used for this class of work are; and that the wire wheel is the cheapest, repairs being taken into consideration. It is remarked that those in charge of boilers would be more apt to test try cocks and gauges if valve wheels were used that were always cool. The wheels are made to fit all sizes and makes of valves, &c., and are designed for use on throttle

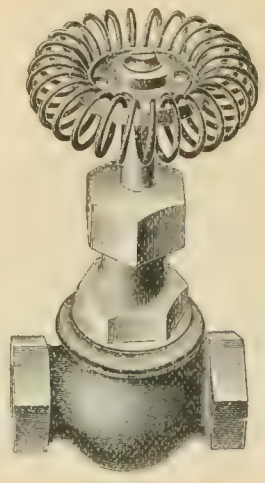

Fig. 2.—Wire Wheel on Valve.

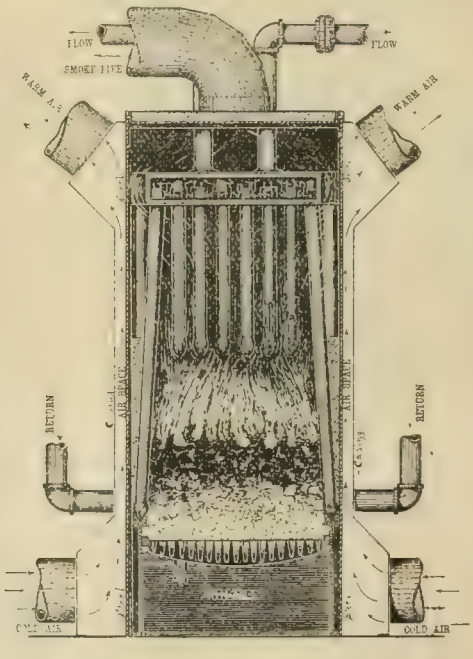
valves, radiators, water glasses, gauge cocks, oilers, injectors, and all hot valves.

Farquhar's Ventilating Hot-Water Heater.

The Farquhar Heating Company, 58 Dearborn street, Chicago, and 217 West Locust street, Des Moines, Iowa, are manufacturing the ventilating hot-water heater which is herewith illustrated. This heater is designed to obviate the use of indirect radiators where ventilation is desired. The outer casing is of galvanized iron, enlarged at the base to form a cold-air distributing chamber, from which one or more pipes lead to the outer air, or air can be taken from the basement if desired. A similar enlargement of the jacket at the top forms a warm-air gathering chamber, from which pipes can be connected with the rooms above. Inside of the galvanized jacket is a similar one of steel, which surrounds the heater, except in front. The steel plates forming this jacket are exposed to the fire, and thus heat the air as it passes in at the base, up between the two jackets and out through the gathering chamber. The construction of the inner jacket is such that there are no seams in the fresh-air chamber to be exposed to the action of fire, and thus all danger from the leakage of gas is obviated. It is claimed that the air heating space thus formed increases the capacity of the heater, that it is a substitute for brick work, and that less radiating surface is required in the rooms supplied with warm air; also that the water circulating system is simplified by avoiding indirect coils, which are liable to freeze. This heater is provided with Farquhar's circulating drop tubes, self mounting rocking grates and balanced draft regulator.



Farquhar's Ventilating Hot-Water Heater.

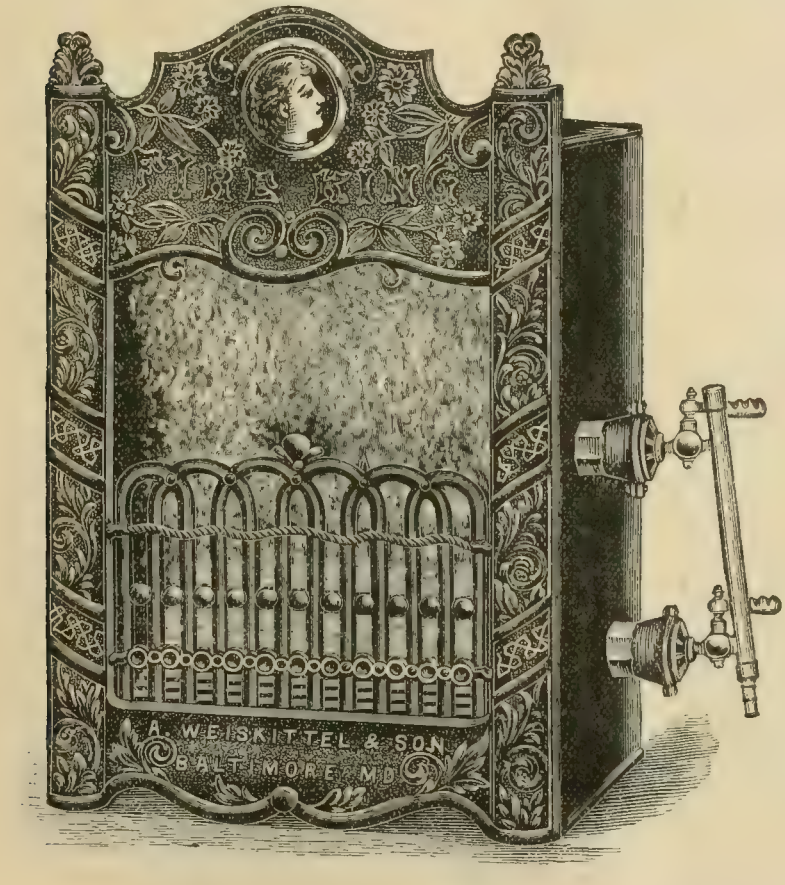
The desirability of establishing coaling stations for the navy abroad is again being taken into consideration by the Government. It is announced that efforts will be made by the new United States Minister to Hayti to acquire Mole St. Nicholas for the purpose, and the purchase of one of the Galapagos Islands from Ecuador is suggested. The cessions of coaling facilities at Samoa and Pearl River, in the Hawaiian Islands, which have long been expected, will probably now be pushed to an issue.

Orange, N. J., enjoys the rather unique distinction of possessing a large force of workingmen who have been farseeing enough to request a reduction of wages. These are the men employed by the Suburban Traction Company, whose business has been greatly curtailed since the closing down of the Orange hat factories. Knowing that the line was being operated at a loss, the men a few days ago, in a communication addressed to the president of the company, offered to work for reduced wages until better times. Their offer was frankly accepted.

The receivers of the Northern Pacific railroad reported on Monday to the United States Court in Milwaukee, recommending the canceling of the Wisconsin Central lease.

The Fire King Gas Heating Stove.

We present a general view of a new gas heating stove made under the name Fire King, which has been placed on the market by A. Weiskittel & Son, Baltimore, Md. The line embraces stoves made in all styles and sizes with either copper reflectors or asbestos frame plates, and finished with or without tile ornamentation. The copper reflector stoves have perforated tops and are constructed to take cold air from the floor, pass it up through the stove and discharge it in a highly heated condition at the top. This arrangement, the manufacturers state, keeps the air in the room in constant circulation, while at the same time the efficiency of the



The Fire King Gas Heating Stove.

stove is greatly increased. In addition to the line of square gas heaters the company also make three sizes of round stoves embodying the features described. The round stoves are neatly ornamented with nickel and the fronts are set with cut glass jewels so arranged that the light from the burners produces brilliant effects. The makers refer to the patent lighter cocks employed in connnection with these stoves as an important improvement and that the smooth castings, fine nickel work, attractive design and finish and powerful heating qualities render the Fire King first class in every particular. The company have just issued from the press a new catalogue and are mailing copies to their friends in the trade.

THE WALCOTT HURLBUT COMPANY, 175 and 177 Lake street, Chicago, have lately supplied the Syphon Eduction range closets for school buildings in La Crosse and Fort Howard, Wis.; Waukegan, La Grange, Western Springs and Freeport, Ill.; Goshen, Ind.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

REEVES & WEST, Gloucester City, N. J., are at present employed on a steam heating plant for the Camden (N. J.) City Hall, consisting of two 35 horse-power horizontal return tubular boilers, with 6000 feet of direct radiation. Among other steam heating contracts on hand are the new publishing house, Camden; store and dwelling for Dr. Trenchard, Glassboro; also, at the same place, dwelling for John Gandy; store and dwelling for A. J. Mann, and dwellings for John P. Stanger and W. H. Beckett; two dwellings for Henry J. West at Gloucester City, N. J.; a hotel for Edward Elliott and a power house and car shed for the Gloucester Electric Railroad. Also, hot-water heating for a dwelling for Harry Reeves, Gloucester City.

SEALED PROPOSALS will be received at the office of the Supervising Architect at Washington, D. C., until October 20 for the steam heating apparatus and pipe tunnel in the United States Marine Hospital, San Francisco, Cal., according to drawings and specifications, copies of which can be had from the Supervising Architect at Washington, or at the office of the Surgeon at the Marine Hospital at San Francisco.

HODGMAN & Co, of Camden, Maine, are having a steam heating plant put in their building.

RUFE & BRO., Doylestown, Pa., have just secured the contracts for heating the new church at Dublin and Frank Keller's residence at Doylestown with steam They also have the contract for heating and plumbing the new house of Joseph Hendricks, at Blooming Glen.

THAYER HEATER COMPANY, Boston, Mass., have been awarded contracts for heating the new depots at Wareham and North Abington, Mass., on the New York, New Haven & Hartford Railroad.

W. T. PERKINS of Dover, N H, has a crew of fitters engaged in installing the steam heating apparatus in the hotel at Milton, which will occupy some time.

JAMES B. CLOW & SON, Lake and Franklin streets, Chicago, have taken the contract for furnishing 40 carloads of Akron sewer pipe for the Pullman farm, Pullman, Ill.

JOHN W. MILLS, 100 Lake street, Chicago, Western sales agents for the United States Heater Company, has secured the order for the hot water heaters to be used in heating several of the cottages connected with the insane asylum at Kankakee, Ill. Ten No. 20 Bolton hot-water heaters are to be delivered by October 1. This is one of the largest single orders received by any heating company this season.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, are to furnish the steam heating plant for residence of W. O. Leeds, Michigan City, Ind. A locomotive boiler 40 inches by 7 feet 3 inches will be used in connection with Champion radiators.

E. BAGGOT, 169 and 171 Adams street, Chicago, has the contract for the plumbing, gas fitting and sewerage in the elegant residence of J. H. Snitzler, Drexel boulevard near Forty-first street.

THE CONTRACTS for hot-water heating in Sanitorum, St. Joseph's Convent and St. Mary's School were taken by Cordes & Dries, 126 Clybourn street, Milwaukee, assisted by John W. Mills, 100 Lake street, Chicago, at whose office the necessary plans and drawings were made.

THE AMERICAN RADIATOR COMPANY of Chicago closed, on September 15, a contract at their World's Fair exhibit with the official engineers of the city of Hamburg, Germany, for four carloads of steam radiators, to be used in heating the magnificent new municipal buildings in the city.

H. WILLARD will put the heating apparatus in St. Mary's Convent building at New Milford, Mass, and in the new residence of L. Fale and Geo. W. Bullard's residence at West Medway. Page heaters will be used in each case.

JOEL C. GLEASON has nearly completed the installation of the steam heating plant in the almshouse at Marlboro, Mass.

THE heating apparatus for the new Whipple-Freeman block at Brockton, Mass., will be furnished by L. R. Churchill.

M. J. CARBOY, 78 Dearborn street, Chicago, is doing the plumbing in Ryerson and Kent Chemical Halls, Chicago University.

AMONG the contracts recently taken by the John Davis Company, heating contractors and jobbers of material, 69 79 Michigan street, Chicago, can be mentioned hot-water heating for the First National Bank, Terre Haute, Ind.; steam heating plants for Rush Medical College and Academy of Science, Chicago; Insane Asylum, Kalamazoo, Mich.

STOVE TRADE NOTES.

Future of the Hot-Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

SEASON FOR WORK

The furnaceman labors at a great disadvantage in having the bulk of his year's work pressed into three or four months, and in this respect he is much less fortunate than the steam and hot-water men, whose work is continuous throughout the year, with only a slight quickening in pace as the winter approaches. The class of buildings and of owners accounts in great measure for this difference, and in addition is the fact that the preliminary work and concealed work is much greater with the hot water and steam contractors than with the hot-air men. The customer of the furnace contractor is often a man who has a house to heat and wants a furnace. He intends to heat the first floor only, and although he begins to figure on the job along in April he cannot be induced to sign a contract until the first frost of the fall has come, and then, at that particular time, all of the people of the town are seized with the idea that their stoves must be put up at once. As a result, the dealer has his hands full, sometimes so full that his customers suffer, particularly the man who orders his furnace at the last moment and has it slapped in in a hurry. The result is often a poorly considered, poorly installed furnace job, which cannot be made to do good work, and a displeased customer lives to tell the tale and injure that particular furnace in the town.

QUALITY OF THE WORK.

It is difficult to get owners to have work done during the spring and summer months, and yet that must be done if the furnace business is properly developed. Good work cannot be done in a hurry and in the midst of the annoyances that always characterize the fall rush season. Some means must be devised to spread the furnace business over a greater period, and (if in no other way) by discriminating against fall work by a difference in price in favor of those who have their work done early in the year. The manufacturer can likewise offer an inducement to those dealers who buy early and pay for the goods. If he carries the goods in his warehouse or on his customers' floors there is an interest and expense account working diligently both day and night which would be reduced materially if the furnace season was not bunched into three or four months, and he could afford to sell his wares cheaper in April than in October, after he has carried them six months longer.

DELAYS DANGEROUS.

By waking up the furnace trade early in the year and making prices considerably lower during the spring and summer months owners would soon realize that "delays are dangerous," and come in out of the cold long before the busy season came around, and the delinquents, of whom there will always be some, will have to pay for bringing up the rear. It is impossible for dealers to do ample justice to work in October and November when their men are being worked to the limit of endurance, and the bad work done during the fall survives the rush and makes no end of trouble, and directly affects the "future of the hot-air furnace."

(To be continued.)

Stove Exhibits at the New York State Fair.

Prominent among the concerns making displays of their goods at the New York State Fair, recently held in Syracuse, may be noted the following :

THE J. F PEACE FURNACE COMPANY,

Syracuse, were represented by their permanent building only, that structure being a counterpart in form of an Economy heater complete with casing. A notice upon the building informed those interested that on account of business, resulting from their present exhibit at the World's Fair, no time had been permitted them to prepare samples for this fair. Visitors were invited to inspect their line at the show room of the company.

THE HOWARD FURNACE COMPANY,

Syracuse, made the customary attractive showing of the Howard warm-air furnaces and combination heaters. Conspicuous in this display were examples of the Howard single-radiator furnace and single-radiator warm-air and hot-water heater, accessions to this line during the past year. These, together with the many styles and sizes of this make of heaters, completed a more than ever satisfying exhibit.

The exhibit of the company was in the permanent building erected two years since for annual use, and is one of the striking features of the New York State Fair. W. E. Ford, associated with Mr Van Kuren, were in charge of the display and to receive patrons.

THE HOWARD THERMOSTAT COMPANY,

Syracuse, made an exhibit of the Isothermo thermostat, the product of that company's works, which was shown in connection with the display of Howard heaters.

TUTTLE & BAILEY

had a representative exhibit of their manufacture of registers in the Howard Furnace Company's building, and were included in the display made by the company of the Howard heaters.

THE CARTON FURNACE COMPANY,

Utica, were contributors to the success of the fair by a representative collection of their line of Carton furnaces and heaters The company occupied their own building on the grounds, familiarly known as the Carton Castle. The arrangement of the exhibit of the heaters of this manufacture was with excellent effect for display and convenience of inspection. W. G. Barrows, salesman of the company, with assistants, was in attendance at this display throughout the week.

THE KERNAN FURNACE COMPANY,

Utica, were exhibitors at the fair of their line of Kernan furnaces, which embraced examples of each size and class of their warm-air heaters for hard or soft coal. The heaters were arranged attractively in the building built for this purpose, and as occupied for several years past by them at the annual State fair. In conjunction with the display of Kernan furnaces, occupying jointly one-half of the same building, was the display of the

SYRACUSE STOVE WORKS'

line of Welcome stoves and ranges. The display of this company's line of heating stoves and ranges proved by its patronage of visitors to be one of the leading features of the exhibition. The joint display was under the supervision of D Plaisted & Son, agents in Syracuse for the two companies named.

KIEFFER BROTHERS,

Syracuse. were among the exhibitors at the fair, their display being mainly a showing in a distinctive and well-conceived manner of the Michigan Stove Company's line of Garland heating stoves and the Pittston Stove Company's Happy Thought ranges, for which Messrs Kieffer Brothers are the agents in Syracuse.

THE PHILLIPS & CLARK STOVE COMPANY

were prominent at the fair by an exhibit of their line of Andes stoves and ranges in the building occupied, as in previous years, by Hessler & Schafer, agents for the Phillips & Clark Stove Company in Syracuse. The display embraced a full line of the goods named and appeared to excellent advantage as arranged by the exhibitors.

THE NASON MFG COMPANY,

Beekman street, N. Y., were exhibitors in the main building of the fair, showing samples of their Equator steam and Gulf Stream hot-water heater.

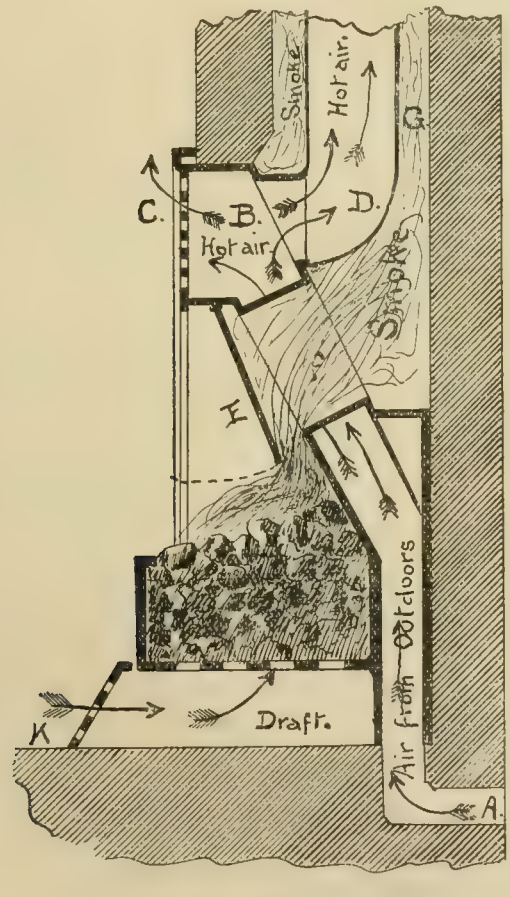
THE KELSEY FURNACE COMPANY,

Syracuse, met those of their patrons and visitors at the fair during the week who were interested in the Kelsey furnace at their warerooms, 389 West Fayette street, where opportunity for inspection of that line of heaters was afforded them.

The Gobeille Pattern Company of Cleveland, Ohio, who are nothing if not original in their manner of bringing the merits of their goods to the notice of their customers, have brought out a useful and serviceable reminder of themselves in the shape of a compound blotter. The pad is built up of four sheets of unequal size, and the areas represent the volume of business done in the years 1889 to 1893. The enlargement last year over the preceding years is graphically shown in the contrast of a blue and pink blotting sheet.

The Jackson Heating and Ventilating Grate.

Edwin A. Jackson & Bro., 50 Beekman street, New York, are directing the attention of architects, builders, dealers and others interested to new features in their combined heating and ventilating grate, as here illustrated. The heating power of the open fire place has been gradually increased in the Jackson ventilating grates, until now, in their opinion, they stand as rivals to the furnace, steam or hot water heaters, both in effi ciency and economy. The principle of an air chamber around the grate, introducing outdoor air, as in the furnace, and combining the indirect with direct system of heating, has been used from the first. This gives, they say, over four times the volume of heat obtained from ordinary grates consuming the same amount of fuel, and allows each fire place to heat several rooms on one



The Jackson Heatir g and Ventilating Grate.

or more floors. This latest improvement is in the shape of the back. Instead of the vertical sides and back, as in the old form, with the opening to the flue at the top of the grate, an over-hang back is introduced, and the smoke goes through this instead of over the top. The advantages of the forward slope are apparent, as a far larger portion of radiant heat is thrown into the room and none can, as in other grates, pass directly from the fire into the chimney. A curtain blower hangs over the opening in the back, checking the draft, when so desired, or, when drawn out, acting as a hood or blower as fresh fuel is added. This dispenses with the need of a porta ble blower and gives a better control of the fire. Emphasis is laid on the fact that the back is a heavy iron casting in a single piece. Therefore there are no joints for the leakage of gas from the fire to the air chamber and the casting cannot become overheated, as those in use over 16 years, of a former construction, are apparently as good as ever. The cut shows the grate arranged to heat on two floors. A indicates the cold-air inlet conducting air to the chamber B, where it is sent to the lower room through the register C, or through the pipe D to the floor above. The air is heated in the air chamber before escaping to either room. The draft of the fire is supplied at K, the smoke passing under the curtain blower E, through the opening F, into the smoke flue G.

Gas for Heating and Cooking.

In a recent discussion on the extension of the use of gas as a fuel, before an association of manufacturers, as reported by the London *Gas World*, one speaker made the following remarks: All are deeply concerned in the development of cooking by gas, and the more attention they devoted to this part of their business the better it would be for the interests of those they served. Another speaker, who had pushed the use of gas stoves, said that his experience with gas fires was not a very encouraging one. About five years ago he started fitting up gas cookers—he did not encourage fires because he did not believe in them altogether. He had them all through his own house, but he thought they were too expensive for common use. When consulted upon the subject he told people that if they were prepared to pay for a gas fire they could have it. No doubt gas fires were very nice for an office, so that papers might be kept free from dirt, or for use in a bedroom for an hour at night; but for other purposes he would not have them. On the other hand, he advised every householder to have a cooker. The domestic servant was the difficulty in the city where he was situated, which was, perhaps, more peculiarly situated than other towns in this respect. Many of the ladies there did little or no work in the kitchen—they left everything to the servant. When a gas stove was tried it was often given up owing to its expense; and thus it was condemned because of the neglect of the domestic. Householders ought to be encouraged to use these stoves. He was always willing to give instruction to any one who thought of introducing one. He had connected the cooker he had at home with a meter to see how much gas was being used, and to discover what the expenditure would be in a given time, and he found that the quantity of gas consumed was 500 cubic feet per week, over a period of four or five years. This was for all the cooking for a family of six people. Compared with other houses the expense worked out very much to the same figure. He would like to see cooking by gas more general throughout the country. The use of gas might also be advocated for boiling rings and for bath heaters. Many of the latter apparatus were in use that were inexpensive and very effective. The application of some of the principles of improved coal stove construction by American manufacturers to their heating stoves renders them more economical than the gas fires referred to above and not subject to the same objectionable expense. The information given on the consumption of gas for cooking can be duplicated by many families here, and even more favorable experience cited. With a more thorough acquaintance with the advantages of gas for fuel the sale of gas stoves will be increased. The use of gas stoves in the tenements of the poorer classes in New York is more general than is supposed and is extending. The cheap stoves that have been purchased largely as an experiment have been an agreeable surprise to their users and the demand for a better grade stove is increasing as the result.

Taunton Notes.

The Taunton stove concerns have all resumed operations, most of them on full time, and although there is no very marked increase in orders, the general outlook is regarded as brighter.

White, Warner & Co. have worked full time all summer, with the exception of two weeks in June, when they closed down in order to enlarge their plant. A new foundry 60 x 75 feet has just been completed by this firm, which will accommodate 20 molders, and their line has been increased by the addition of a new parlor stove, the Household Square, made in two sizes, fitted with draw-center grate, highly ornamented, and intended for a high-grade stove. A round parlor stove in three, and a wood stove, the Household Cottage, in two sizes, will also be put on the market for the fall trade.

R. E. Walker of the Weir Stove Company has just returned from Chicago, where he has been doing the fair.

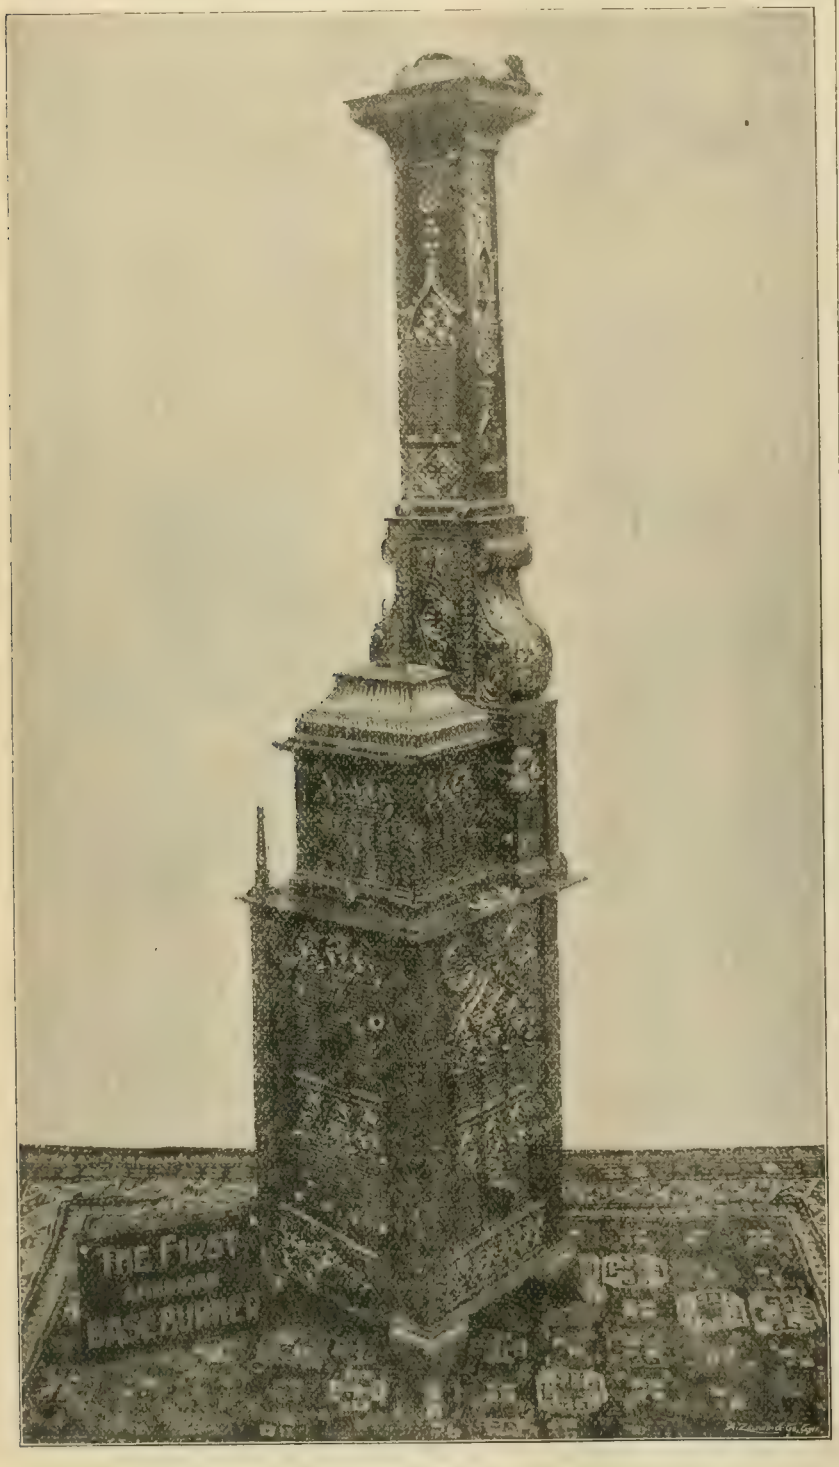
O. G. Thomas will not put any new styles on the market this season, but will push the old lines.

The Weir Stove Company have recently put on the market a new range in four sizes, which is known as the Glenwood H. The only new feat-

ure is the absence of nickel work except on the corners. This saves trouble in keeping bright, and adds to the artistic appearance of the range. Our Glenwood, a new round parlor stove in two sizes, is in preparation.

A Unique Base Burner.

In the accompanying illustration we present a general view of a stove of curious design, which is said to be the first base burner produced in this country. Unfortunately, we are not in possession of facts which will enable us to lay before our readers a general description of the interior construction or to indicate in any way the principle involved. The design, however, is unique and as a curiosity will warrant study on the part of those who are interested in the early history of the stove trade. For the engraving here presented we are indebted to the Michigan Stove Company of Chicago.



A Unique Base Burner.

The Buckwalter Stove Company,

proprietors of the Continental Stove Works, Royersford, Pa., have just issued a catalogue of their stoves, ranges and heaters, and all previous price-lists are by this issue withdrawn. The volume is in handy form, being about one-half the size of their previous catalogue. It contains 130 pages copiously illustrated, and all the cuts are new. It is tastefully bound in stiff paper covers, strengthened with linen, the front handsomely lithographed in colors and having for a centerpiece the striking trade-mark of the company, while on the back is an illustration of their works. An announcement to the trade, in which mention is made of the excellent shipping facilities enjoyed by the company, with a list of terms and special notices and directions for ordering repairs, precede the descriptions of the goods. The new goods described in the book include the Art Ringgold base-burning double heater, with straight draft or full revertible flue, portable full nickel dome, nickel base and foot rails, large magazine with automatic cover, heavy fire pot, with Ransom's improved Duplex and shaking grate, large ash pit and an ash pan that catches all the refuse; the Art Ringgold single heater, similar in most respects to the double heater; the Ensign heater for anthracite or bituminous coal, a straight draft surface burner of handsome design, with nickeled feet and skirting, foot rails, name plate, spun urn ornament, patent center-discharge grate, heavy fire pot and large ash pit; and the Ecipse Duplex furnace in its improved form, with massive and attractive front, enlarged ash pit and ash-pit door, upper or dome section in one piece and front vapor pan. The remainder of the catalogue is devoted to Apollo ranges, which are now supplied with either right or left hand oven doors; Model Apollo ranges; heating attachment for upper rooms for use in connection with Apollo ranges; New Cresta, Art Canopy, Canopy, Pluck, Energy, Samson, Comrade, Coral, Coin, Dakota and Archer ranges; Art, New Eclipse, Geneva and other cook stoves; Happy Greeting, Ringgold, Magic Ringgold, New Opera, Homer, Laura and other heating stoves; laundry, tailors' and farmers' stoves; Eclipse and Storm furnaces; a handsome line of fire-place heaters, including the Royal Empire ventilating grate and heater, with and without art tiles, a comparatively new addition to the line; lists of shoe furnishings and repairs, and a well-arranged index.

ODD PLATES.

The Miller Grate Company of Cleveland, Ohio, are the assignees of a patent granted to Peter I Miller of that place for a gas burner designed for use in connection with heating stoves or grates. The burner has a large combustion surface provided with openings at intervals, through which the gas flows. Arranged about the openings is asbestos or other uninflammable material, thus giving, the inventor claims, an evenly distributed blue flame to the entire front of the burner.

The Phillips & Clark Stove Company of Geneva and Troy, N. Y., have met with gratifying success at a number of fairs recently held at which their goods were displayed. The company secured first premium at the Troy and New England Fairs recently held in Troy, N. Y., and also first premium at the Cambridge Fair, held at Cambridge, from September 5 to 8, inclusive.

Floyd, Wells & Co. of Royersford, Pa., have issued an eight page circular illustrating and describing some of their leading specialties. The goods shown include the New Rosemont, a full revertible flue double heater, fitted with Ransom duplex grate and improved shaking device; the Jewel Rosemont, a well proportioned full revertible heater made in several sizes; the Special, an open Franklin stove with circular fire pot, and the Irving range, made with reverberatory oven and corrugated oven plate. The construction

employed is such, the makers claim, that a continuous rotary circulation of the air in the oven is secured independent of that obtained by their method of oven ventilation. By it the heated air is conveyed to the article to be cooked "this action being caused by special flues in the oven plate which constantly carry the hot air from the oven plates to displace the lower temperatures surrounding the article in process of cooking. As one current of air is partly cooled by absorption in contact with the article cooking, it is driven away by another current of highly heated air, thereby cooking much more rapidly." The company claim that by the use of a corrugated oven plate a gain of about 20 per cent. of radiating surface is secured.

The Art Stove Company, Detroit, Mich., have recently been granted a patent covering the construction employed in connection with their oil heaters, for which a very gratifying demand is reported.

According to a recent issue of the *Daily Journal*, published at Middletown, Pa., the management of the Lebanon Stove Works, Lebanon, Pa., will, on October 1, pass into the hands of J. Max Reilly, who for several years has been employed in the general office of the Raymond & Campbell Mfg. Company. Mr. Reilly has obtained an interest in the Lebanon Works and is well qualified for the position to which he has been called by the directors.

The Union Stove Works, 70 Beekman street, New York, are issuing a seasonable nine-page sheet, printed in two colors and devoted to sheet-iron stoves. The Dash comes first and is intended to meet the demand for something cheap. The Flirt occupies seven pages with its variations of direct draft, revertible flue and extension top, and is furnished in seven sizes, from 8 to 16 inch cylinder. The Belmar is a handsome square stove of "brand new construction that leaves little to be desired." On the back page is an engraving of their Commander furnace, showing the internals, which in this case consist of an advertisement of their line of goods and an invitation to send for a catalogue.

Furnaces and furnace fittings made by the Excelsior Steel Furnace Company of Chicago, Ill., are being shipped to many new and old customers at this time. The company say that the furnace business is on the move to a higher plane, and that the trade show an appreciation of all steps toward improvement.

A handsome dark green leather card case, bearing in gilt letters "Compliments of Richmond Stove Company," comes to hand, bearing a steel engraved card of the house, a feature of which is the trade-mark of the Richmond stoves, ranges, furnaces and steam and hot-water heaters.

A very elaborate pamphlet is published by the Bennett & Peck Heating & Ventilating Company, Cincinnati, Ohio. The volume is bound in glazed and tinted paper, measures 9 x 11½ inches, and contains about 80 pages of letterpress. A very thorough description of the system of heating and ventilation employed by this company is presented in the pamphlet, and it also contains much miscellaneous information on the subject. A notable feature of the publication are the colored plates of the Bennett & Peck apparatus, showing the arrangement of the flues in schoolhouses and also the construction of the different furnaces for schoolhouses and churches. Other illustrations in plain colors are scattered through the book, giving further particulars about this apparatus and system. It will also be noticed that there are many humorous and illustrative sketches, teaching graphically the advantage of the Bennett & Peck system. In addition to that part of the publication which is devoted to mere catalogue purposes, there is also a great deal of information on the general subjects of heating and sanitation, the importance of pure air being continually insisted on, as it is proper that it should be.

In a late issue of *Art in Advertising*, E. C. Moses of the J. F. Pease Furnace Company, Syracuse, N. Y., has an interesting article on "Advertising at the World's Fair," in which he tells his experience with his concern at the exhibition, and gives as the result of his experience that he is well satisfied with the advertising that the fair afforded. Along with the article is a half-tone engraving, giving a pretty view of the Pease exhibit at the fair.

The Michigan Stove Company have sent us a package of the circulars they are now distributing to the trade. There is a sheet of "local notices" suitable for insertion by dealers in their local newspapers. Another sheet shows different sizes of cuts of the Garland trade-mark, prepared for the use of merchants in advertising in local newspapers. A very tasteful circular letter calls attention to the manner in which the company are advertising, and shows merchants how to co-operate so as to secure direct benefit from the plan at comparatively light cost to themselves. A "Drawing Book for Young People" contains a number of pleasing subjects, outlined in white on a black background, and affords something for steady occupation by young folks during the long winter evenings now rapidly approaching.

The Bloomington Stove Company of Bloomington, Ill., have recently completed a new engine and boiler house, which puts their plant in very much better shape for manufacturing.

McLaughlin & Co. of Second and Willow streets, Philadelphia, stove pattern makers, have removed to 215 North Second street, in that city, where in future the business will be continued under the style of John K. McLaughlin.

The stove warehouse of Graff & Co., Pittsburgh, was damaged by fire to the extent of $1000 last Monday.

The Superior Furnace Company, Little Falls, N. Y., send out advertising cards to the trade that convey a strange impression concerning the buildings at the Chicago Fair. The engravings are very neatly executed, but they show the walls of the buildings highly colored in a variety of ways, which will be a surprise to those who are familiar with the White City. The back of the cards contains advertising matter relating to the products of the concern.

The Manhattan Brass Company, with salesrooms at 44 Murray street and with factories in East Twenty seventh and Twenty-eighth streets, New York, send us an illustrated circular of the Star heater, intended for burning oil as a fuel. These goods very much resemble large lamps with a heating drum in the place of a chimney. They are made of brass, oxydized and nickel plated, with aluminum top and Russia iron cylinder. The makers claim that this device will heat a room 15 x 20 feet in size to the temperature of 70° in the coldest weather, at a cost of about 1 cent per hour. The four sizes of the Star heater are shown in the circular before us. The goods are referred to as being light and portable, as well as attractive and powerful for heating purposes.

We are indebted to the Superior Furnace Company, Little Falls, N. Y., for a poster lithographed in colors, showing a sectional view of the Superior steel furnace and giving an excellent idea of its construction. The poster is printed in five colors, which enables one at a glance to follow the course of the products of combustion from the fire pot to the smoke pipe. Accompanying the poster we find circulars showing the Superior steel range, which is made in several sizes and varieties, and which embodies features of construction that cannot fail to command the attention of the trade. A second circular shows the various styles of the Superior line of furnaces and ranges as manufactured by the company at this time. These novelties are being distributed to the customers of the Superior Furnace Company and, we are informed, are bringing out numerous congratulatory letters upon this method of advertising. Last week the company started their works after a brief shut down, and report the receipt of a number of good-sized orders for their product. The indications point to a lively trade during the last quarter of the year, especially in the Middle, Western and Eastern States. The company report a complete stock of goods on hand, which will enable them to make prompt shipments.

The John Van Range Company of Cincinnati, Ohio, send us a circular showing the Pacific six hole range which they manufacture in styles to meet varying requirements. Attention is also called to the John Van range, which is referred to as still in the front rank. The family ranges made by the company consist of the Pacific, Atlantic, Plantation, Chimney Corner and the Maggie, all of which are adapted for burning various kinds of fuel and in the construction of which the company employ the best of material and workmanship. One of the features is their patent reversible grate, which is claimed to be economical, easily manipulated and most desirable in every way. The ventilated top plates and long centers of the ranges have an air chamber through which currents of air are constantly circulating, keeping them from warping and burning out as quickly as ordinary plates.

The J. F. Pease Furnace Company of Syracuse, N. Y., are enjoying a gratifying volume of business and state that their sales are very nearly up to those of last year. The company are running their works full up to 10 o'clock at night with the exception of Saturday. They are filling orders promptly and state that they are shipping more high-grade goods than usual.

Vice-President George H. Barbour of the Michigan Stove Company, who is a member of the World's Fair National Commission, representing Michigan, in connection with Hon. T. W. Palmer, takes a very great interest in exposition matters. Unlike many members of such bodies, he does not regard the position as merely honorary, but devotes himself to practical work. In consequence of this readiness to apply

his energy wherever needed, Mr. Barbour has earned decided prominence and gained national prestige. No little of his popularity is due to his cordiality and the tact with which he handles those who have occasion to meet him either in an official or unofficial capacity.

THE QUICK MEAL STOVE COMPANY, St. Louis, Mo., advise us of a shipment of a number of their new Process stoves to the Cherokee Strip, and also of the shipment of a carload of stoves to Los Angeles, Cal. Carload orders are very scarce just now, and especially of gasoline stoves, and it certainly indicates that the Quick Meal gasoline stove is still in demand notwithstanding the lateness of the season.

THE EXCELSIOR MFG. COMPANY, St. Louis, Mo., are distributing to their friends and customers interesting advertising matter relative to the goods which they manufacture. One of the circulars is unique, in that it is printed in *fac-simile* of hand writing upon common brown paper, the corners of the sheet being torn to indicate rough handling. Another circular refers to the approaching cold weather, and to the fact that during the past six weeks or two months very few stoves have been made owing to the shutting down of foundries. The company intimate that even if there is a moderate demand for stoves this season there will not be too many to supply the needs of the trade, owing to the fact that when the foundries closed stocks were not heavy. The Excelsior Mfg. Company state that they have a full assortment and a fair stock, and suggest to customers that they place their orders early before the rush begins so as to insure prompt shipment.

Gas Lighting, Heating and Cooking.

"THE MAN who lights Harlem" is the title selected by A. P. Mulvey, the manager of the Jos. P. Corney Gas Fixture Company, at 137 West 125th street, New York. The factory is in Brooklyn, but the main office has recently been located in larger quarters at the above address, where a fine show is made of chandeliers, hall lamps and brackets. One room set apart for lamps is called the art room, from the character of the goods displayed. Their wholesale trade covers a wide territory and the season approaching finds them busy filling orders.

THOSE WHO ARE in closest sympathy with the gas stove trade and the users believe that a stronger tendency is being developed toward the substitution of gas for coal entirely for cooking purposes.

THE GAS APPLIANCE EXCHANGE, at 37 West Fourteenth street, New York, is bringing heating goods to the front, but still have a fine line of gas cooking goods attractively displayed.

"THE FALL TRADE in gas stoves has not opened up yet, but we are ready with some nice heaters when it does," is the way Chas. Hetzel, Jr., Sixth avenue, above Fourteenth street, New York, speaks of the season.

E. K. CONANT, 9 West Fourteenth street, New York, is the agent for the Dangler Stove & Mfg. Company, of Cleveland, Ohio. He is issuing a 16 page pamphlet of the Dangler gas heaters for the coming season, with an invitation to "call and see the Dangler radiator before buying." The first half of the pamphlet is devoted to radiators, for which economy, efficacy and elegance are claimed. They say of the Dangler new style radiator: "This radiator is entirely new in principle. It is a base heater, taking the heat up through the center flue and returning it down to side flues, discharging it at the bottom, making the top hot, and the outpour from the bottom heats the floor, and persons can warm their feet as well as by a base-burning stove. The other pages are devoted to round and square open sheet-iron reflector and asbestos heaters. A carload of these goods are *en route* for the New York house.

LANDON KETCHUM, South Norwalk, Conn., has a fine line of his gas stoves attractively arranged at his main office, 23 West 125th street, New York.

THE DEALERS in gas stoves say that the proper thing in heating apparatus this fall seems to be radiators. These radiators consist of several sheet-iron tubes with an ornamental cast iron crown and base. As a rule, they burn with an illuminating flame, and some have mica windows.

A. J. DOTY of 2013 Fifth avenue, New York, has severed his connection with the Harlem Gas Appliance Exchange, and is now visiting the World's Fair to add to his wide knowledge of gas and gas appliances.

LUTHER & LEDERHOS, Cliff street, New York, have a very pretty gas radiator, known as Model No. 201.

ANNOUNCEMENT is made by the Shepard Hardware Company, Buffalo, N. Y., that they have sold and transferred to North Bros. Mfg. Company, Philadelphia, their Ice Cream Freezer business, including patterns, trade-marks, &c., and all orders for Freezers of the kinds formerly made by them, as well as repairs for the same, should be sent to the latter concern. North Brothers Mfg. Company state that they will be ready to furnish the full line of Lightning Freezers by December 1 next, and probably earlier than that date. In the manufacture of the goods the company will maintain the high standard of materials and workmanship which has distinguished these Freezers in the past. With this addition to their line the North Bros. Mfg. Company will undoubtedly occupy a conspicuous position as one of the leading manufacturers of Ice Cream Freezers in the country.

THE RECEIVERS OF WALLACE & SONS, Ansonia, Conn., and 29 Chambers street, New York, have issued an announcement to the trade, referring to the fact that owing to the financial stringency it was necessary for the company to go into the hands of receivers the latter part of August, and expressing their conviction that this condition of affairs will be only temporary. Meanwhile the receivers have started up the different mills and factories. A large stock of goods is on hand finished and ready to ship, so that orders from the trade can be executed promptly.

R. C. SNOWDEN, McKeesport, Pa., has been granted a patent on a strap for tin-plate boxes. These straps are formed in a press and made to fit the corner of a box, with nail holes punched and countersunk and the ends turned down to prevent them from catching on anything. The advantages of straps of some sort will be appreciated by those who are familiar with the dilapidated condition in which tin-plate boxes so often arrive.

Artificial Light.

We may sum up the advantages and disadvantages of electric light and gas light as follows, says an English exchange: Where powerful lights of great intensity are required, electric light would be preferable to gas light; but if the lighting consists of a great many small lights, gas may be preferable to the electric light because it is easily distributed without loss of energy. Objects are seen by electric light in their natural tints, while by gas light some colors cannot be distinguished at all, and others appear different. For chemical effects gas light is altogether impracticable. The electric light hardly increases the temperature in inclosed spaces, and products of decomposition injurious to health and inanimate objects are not formed; whereas gas raises the temperature considerably, and also causes the formation of carbon dioxide, compounds of sulphur, &c., which are injurious to health as well as to inanimate objects. Although the comparison of cost between electric light and gas light is of great importance, general rules are difficult to formulate, and the comparison must usually be made with special reference to the particular case under consideration. If a public supply of electric energy is available and glow lamps are used, it may be stated that at 6 pence per Board of Trade unit a 16 candle-power glow lamp is as cheap as a 5 cubic foot burner using ordinary gas at 6 shillings per 1000. When, however, the installation is sufficiently large to justify the putting down of special generating plant the comparison is much more favorable to the glow lamp. For purposes for which arc lamps can be used they are undoubtedly cheaper than gas. The adoption of the electric light will by no means do away with gas. This would, on the other hand, probably become more important than ever, although its form of utilization would possibly become altered. Using gas for heating purposes is a rational utilization of the coal, for during combustion of the gas the production of heat is far in excess of the production of light, which is proved by the heating of the air in closed spaces, and, still further, by the following statement: Large gas engines produce 1 horse-power by the consumption of 35.3 cubic feet of gas per hour. With such an engine, by using the electric arc light, a light of 1700 candle-power can be obtained; but if this quantity of gas is consumed by ordinary gas burners only seven flames of 16 candle-power each can be obtained—*i. e.*, a light of 112 candle power. It is, therefore, possible that the electric light may gradually take the place of gas, although the employment of gas will not become obsolete.

A computation made by *Engineering* shows that to patent an invention throughout the world costs nearly $14,000, there being 64 governments which have separate patent laws.

Mayor M. S. Harris of the city of Franklin, Ky., which has 25,000 inhabitants, wishes to correspond with companies that erect electric light plants and a system of water works.

TRADE REPORT.

The Iron Market.

While it is probable that manufacturers in different branches of the Iron and Steel trades have started to some extent on old orders, delivery on which had been previously postponed, it is true that the great majority of them are skirmishing about in a very lively fashion to secure additional work. Unless costs have been modified in a very extraordinary manner during the last three months, some sellers are going ahead without any reference to cost sheets. The actions of some of the largest producers seem to indicate that they do not hold any rosy views concerning the near future. They are taking business, wherever it is in sight, at unparalleled prices.

The easing of the money market may be said to be operating in two ways. It is causing the withdrawal from sale of some goods on which the banks had advanced, because those institutions, being able to carry them, believe the time for disposing of them unfavorable. Some manufacturers, however, are pursuing the opposite course because now they know that those to whom they sell can arrange for payment, which they could not do a few weeks since.

We note that there is being advanced, particularly by Southern furnacemen, an argument in support of a possible sharp advance this winter which deserves consideration. Our friends figure out that so little Lake Ore will be on hand at lower Lake ports at the close of navigation that it will not last until the opening of the season of 1894 Hence there will be a scarcity reflected in high prices, which will give Southern makers a chance to make a very substantial advance. Such a contingency could happen only if there were a very active trade in the fall and winter and if, particularly, the Steel Rail trade were to return to a normal condition.

Pig Iron.—There has been very little movement in the New York market, although the starting of a number of foundries is bringing some inquiry for small lots. It is probable, however, that in the majority of cases buyers avail themselves of postponed deliveries to cover their immediate requirements. The 5000-ton lot of Southern Iron which bankers were offering last week has been withdrawn, the pressure for money having probably become less, so that it is possible to await a more favorable period for disposing of the iron. Thus far only 300 tons of Southern Charcoal Iron have been announced to be sold at auction. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

The Philadelphia market for Pig Iron is reported as less favorable than might be expected, considering that the money panic is pretty well at an end. Although there is some demand, yet there are more sellers than buyers. The general tendency has been toward somewhat lower figures, and would probably be still more so if large lots could be moved for cash or for first class negotiable paper. As there is only a limited supply of these commodities, sellers content themselves with such business as they can get in small lots, and as near to quoted rates as possible, which for Philadelphia and equivalent points are usually about as follows: $12.50 @ $13, delivered, for Plain No. 2, $13.75 @ $14.25 for No. 2x and $14.50 @ $14.75 for No. 1x.

In the Chicago district inquiries are reported as being more numerous and the feeling as steadily growing better. Even consumers of Charcoal Iron are testing the market. Many of the inquiries now received are contingent on the starting up of foundries. The foundrymen are hopeful that they will soon have sufficient work to resume operations, and in that event a great deal of Iron will have to be purchased. The resumption of operations by the Agricultural Implement works will make shipments heavier within the coming month. This is also expected to influence the Charcoal Iron market, as a good demand will then be thrown on the Malleable works, which have for some time been doing but little. Quotations are now as follows for cash:

Lake Superior Charcoal	$16.00 @ $16.50
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.50 @ 12.75
Local Scotch	14.00 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 14.50
Southern Silvery, No. 2	@ 14.00
Southern Coke, No. 2	12.35 @ 12.60
Southern Coke, No. 3	11.60 @ 11.85
Southern, No. 1, Soft	12.35 @ 12.60
Southern, No. 2, Soft	11.85 @ 12.10

Jackson County Silvery	16.00 @ 17.00

The demand for Pig Iron in Southern markets has kept up fairly well. Sales are reported aggregating about 15,000 tons, largely for stove works and for purposes presumed to be for mixing and for Pipe works. The prices which have been obtained were $7.50 for No. 3 Foundry, f.o.b. Birmingham, and these prices, with $8.25 fo No. 2 Foundry, seem still to find sellers, for when more has been asked sales could not be effected, although it seems probable that about all of the Iron obtainable at these low prices has been closed out; at any rate, it is certain that many furnaces in the South will not entertain further bids except at an advance of 25¢ ℔ ton. There is a pretty liberal number of orders for single carloads of Pig Iron passing, and there is an enlargement in the demand from the East for various kinds of Iron. There are more inquiries for long forward delivery, but the furnaces are not disposed to entertain them except at such an advance in price as prohibits trading. There is no movement in Charcoal Iron; in fact, there is not much trading in other leading kinds of Southern Coke Iron. The undertone seems to be strengthening and an advance must take place if the demand keeps up. Quotations as follows:

Foundry.

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75

Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—The past week has witnessed a further advance of about ½¢ ℔ lb in the price of Straits Tin, and the tone of the market looked stronger than at any previous time since the inauguration of the upward movement. First hand stocks are being steadily reduced at the rate of at least 1200 tons per month, and the quantity unsold in the United States, exclusive of the Pacific Coast, is now between 4500 and 5500 tons, or say equivalent to about four months' consumption. In a speculative way there have been only moderate dealings of late and interest is by no means lively at the present time. Such as it is, the trading is between regular operators. At the close of the week the market was very firm, with sales at 20.50¢ @ 20.55¢ for prompt delivery and 20.70¢ for October. Bids quite as high were made subsequently in the face of lower quotations from London. Straits shipments first half of September were 1075 tons to Great Britain and 400

tons to Continent, against a total of 305 tons during the corresponding period last year. Jobbers' prices for small lots remain unchanged, with a fair demand.

Copper.—No further change in prices has taken place and the market apparently retains very firm tone. Home trade buying seems to be very commonplace, with the amount of Copper involved only fair, but home deliveries and exports together take up enough stock to keep the statistical position good. Lake Superior Ingot is quoted at 9⅞¢ @ 10¢, according to brand and terms of sale. Retail demand is fair; orders and inquiries for moderate lots show considerable activity, but little or no demand exists for larger quantities than are needed for present requirements. Prices are firm at former quotations, namely: Lake Ingot, 11¢; Ansonia grade Arizona, 10½¢; Ansonia grade Casting, 10¢.

Sheet Copper.—There is quite a good volume of business moving in this material, mainly in orders for moderate quantities. Small dealers and consumers throughout the country are carrying little or no stocks beyond what is absolutely needful for present requirements, constantly all orders are accompanied by a request for prompt shipment. Prices incline to harden, although quotations for small lots remain unaltered.

Pig Lead.—Dealings in this metal have been on a moderate scale, and the demand has shown some falling off also, while prices are a shade easier. Thus against 3.85¢ bid a short time ago there have been sales recently at 3.80¢ for October delivery, while 3.85¢ stands as a common asking price at the moment for deliveries running during the balance of the year. For small lots dealers are asking an advance of ⅛¢ @ ¼¢, or 4¼¢ @ 4⅜¢ for American Pig, and 4⅜¢ for Bar Lead. The retail demand is light. There appears to be no prospect of any material revival in the near future.

Lead Pipe and Sheets.—The consumptive demand for manufactured Lead is only of a slight nature. The abandonment or postponement of building operations in many quarters, owing to the difficulty experienced by contractors in obtaining monetary accommodation, has materially reduced the ordinary volume of fall business. It is not believed that much activity will be experienced in the demand for Plumbers' Supplies until next spring. Prices continue unchanged, in view of the reduced demand for Lead Pipe and Sheets, which makes any present advance impossible.

Spelter.—The market is wholly unchanged. Dealings have been moderate and chiefly at last week's prices, while buyers' and sellers' ideas of value have remained stationary. Fair quotations would appear to be about 3.75¢ @ 3.80¢ for ordinary Western brands, with the usual premium on choice brands. For small lots Western spelter still 4¼¢ @ 4⅜¢.

Tin Plates.—The principal feature of the local Tin-Plate market during the week has been some liberal purchases of spot Cokes for the Baltimore oyster packers, which have caused a larger movement in these Plates than has been experienced for some months. It is said that certain sizes of imported Cokes are becoming scarce in consequence, and on these the price has hardened, with a tendency to advance. In other lines a fairly good jobbing movement is noted in Ternes and Charcoals. Jobbers' orders, which have increased in number, are mainly for moderate quantities and spot delivery. Futures are still neglected. The aggregate of orders for the week, although hardly up to a fair average for the season, shows, however, a marked advance in demand over the last few months. Orders for future shipments from Europe are very light, and until some thing definite is known as to the trend of tariff legislation importers are unlikely to stock up with imported Plates to any extent. Prices, while unchanged, are inclined to stiffen in most lines of Plates, and concessions are harder to obtain than has been the case for some months past. Altogether a better feeling exists, and collections are reported as distinctly easier, while it is noticed by jobbers that small orders are often repeated by the same purchaser, showing that although consumers are unwilling to load up with any unnecessary stock, there is a healthy consumptive demand going on all the time. This keeps the trade moving, and promises that when the business situation is once more settled a good, strong market will develop.

Sheet Iron.—Prices on Black Iron are inclined to stiffen, owing to a rather better demand and reductions in stocks of certain sizes. The output is, however, increasing by the resumption of operations in some mills, and it is unlikely that any scarcity will occur. Galvanized Sheets are becoming scarce, and manufacturers are reported as unable to fill all the orders received at the mills. Prices continue firm, but there is no sign as yet of any advance in the price-list. This may, nevertheless, take place before long unless the output of Galvanized Iron is materially increased.

THE ROCHESTER RADIATOR COMPANY, Rochester, N. Y., send us a 12-page circular relating to the Rochester Radiator, for which many claims are made. This device is intended to increase the capacity of the stove in connection with which it is employed, and also to heat an adjoining or upper room, as the case may be. This radiator is illustrated and described in the pamphlet before us, while extracts from testimonial letters show the satisfaction which the radiator has given to those who have used it.

Chicago Report.

Scrap.—The inquiries from distant buyers reported last week have not led to business, and the outlook is discouraging for dealers in Old Material. They offer the following rates, Chicago delivery, to country collectors:

	Per net ton.	Per lb.
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5 00	....
Cast Borings	3 00	....
Turnings	4 00	....
Horseshoes	8.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	6 ¢
Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2 1-10¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	2 ¢

Anthracite.—A good business is reported by the large dealers. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

THE TIN CAN FACTORY of Sylvester Ruth & Son, Baltimore, Md., was burnt out last week, the loss amounting to $8500. It will be rebuilt at once with a new outfit of machinery.

THE JOSEPH DIXON CRUCIBLE COMPANY, Jersey City, N. J, issue a little leaflet which they entitle "The Cost of a Lead Pencil." They explain that the cost in a lead pencil is not the way it is finished, or the wood, or the stamping or the varnishing, but the time and labor spent in manipulating the material of which the leads are made.

BERGER BROTHERS, 237 Arch street, Philadelphia, Pa., make an announcement of particular interest to architects and tin roofers. The advertisement relates to their Eave-Trough Hangers and Pipe Fasteners, illustrations of which are shown in the announcement and some particulars are given in the text.

THE PHELPS METAL COMPANY have organized at Syracuse, N. Y. They will manufacture Cutlery and Hollow Ware. The capital stock is $50,000.

CONDITION OF THE

Hardware Trade.

REPORTS FROM THE leading markets of the country indicate an improvement in business. While trade has not assumed the usual volume, there is a fair degree of activity and a good many orders are being placed. While these orders are carefully assorted and cover only such goods as are demanded by the immediate requirements of business, their aggregate is considerable. It is noticeable that many of the jobbing houses are replenishing their stocks with a little more freedom than heretofore. There is, however, no evidence of a disposition to buy beyond the early requirements of trade, and merchants are still conducting their business very conservatively. Many more travelers are on the road than a few weeks ago, but there are not as many out as usual, most manufacturers and jobbers conducting their business with especial care and economy, and refraining from keeping on the road travelers whose business does not justify the expenditure. Advices from the retail trade indicate a preceptible improvement in business since the opening of the month, and it is pleasant to note that in many sections business is referred to as nearly if not quite as good as usual at this season. The extent to which building is affected by the recent financial troubles is illustrated in statistics which have recently been published relating to the building departments of New York and Brooklyn, which show that exceptionally few new buildings have been projected during the past two or three months. From July 8 to September 9, 1892, permits for 468 new buildings were issued in New York and 903 in Brooklyn, making a total of 1371, while during the present year, in the same period, the number of permits issued in New York was 290 and in Brooklyn 358, making a total of 648—a decline of more than 50 per cent. There has also been a marked decrease in the estimated cost of the buildings projected. There has probably been a similar falling off in building enterprises in many other cities, and perhaps throughout the country at large, the effect of which on trade cannot fail to be felt. Manufacturers are availing themselves of the improvement in business and are pushing sales more vigorously than during the past two months, and their solicitude for business results in some cases in slightly lower quotations. Prices on the whole, however, are pretty well maintained. Collections show a very satisfactory improvement, and there is much less complaint on this score than a few weeks ago. The delay of action in the Senate in regard to the repeal of the Sherman law is having some disquieting effect in financial and mercantile circles, but it is hoped that under the pressure of public sentiment the repeal act may be passed without much further loss of time.

Advices from Chicago.—The Shelf Hardware jobbers report a continued excellent demand for seasonable goods, which brings the volume of business up close to the usual fall trade. General Hardware, however, is moving out very slowly, and there is some apprehension that as soon as the trade in season goods it over there will be another period of dullness in this line. This view, however, is not entertained by all jobbers, some being hopeful that there will be good business up to the close of the year. The tinware houses report a better demand for goods of that character, but specialties in the dairy line are very quiet, owing to the bad condition of pastures. The Heavy Hardware trade is quite good in Iron and Steel, but not in other departments. The wagon and carriage builders are still buying very sparingly, and the outlook in that direction is not very encouraging. Manufacturers' agents have had a notable increase in their trade the past week. Collections are fair, very little complaint being heard on that score.

Notes on Prices.

Wire Nails.—There has been a good degree of activity in the Wire Nail market and most of the mills are well occupied on orders. Their business has been for the most part in lots of moderate size, there not being a disposition on the part of the largest purchasers to order more Nails than are sure to be required in the near future. The buying is thus limited to the necessities of the trade and an entire absence of speculative spirit is noticeable. There is some unevenness in prices and the market gives indications of weakness. Some of the manufacturers are disposed to hold pretty firmly to the quotation of $1.50, but the greater part of the business has been at lower figures. As a general quotation $1.45 to $1.50 may be named for ordinary lots, but the lower figure is shaded under pressure. Small lots from store in New York are quoted at $1.60 to $1.65.

Advices from Chicago.—Wire Nails are weaker from factory, notwithstanding a better demand. Plenty of orders are being booked, but by those who are making the lowest prices. The manufacturers are now selling lots of 400 or 500 kegs at the price they would ordinarily ask for very large quantities. Quotations from factory are in the neighborhood of $1.45, Chicago, but this is shaded to the best trade. Jobbers continue to quote small lots at $1.50 to $1.60, but their prices are not so firm as they have been.

Cut Nails.—The Cut Nail market, on the whole, is devoid of specially new features, and there is but little improvement in the demand to report. Transactions are limited to the immediate requirements of the trade. Prices also continue without material change, but there is, perhaps, an undertone of weakness perceptible, and it is not unlikely that an attractive order for prompt cash could be placed at low figures. Small lots from store in New York are held at $1.25 to $1.30.

Advices from Chicago.—Business in Cut Steel Nails is improving steadily, and September will show a much better trade for manufacturers than August. Inquiries are being received from a little wider territory now than last week, showing that the improvement is covering a larger field. Prices are unchanged, factory lots being quoted at $1.20 @ $1.25, Chicago and small lots from stock, $1.30.

Barb Wire.—An increase in inquiries for Barb Wire is reported and also some improvement in the demand. The market is in substantially the same condition as regards price, and quotations are on the basis of $2.40 to $2.45, for carload lots at mill of Four Point Galvanized. It is understood that these figures are slightly shaded in special cases.

Advices from Chicago.—Manufacturers of Barb Wire report a fair demand, which is perhaps a trifle larger than a week ago, with indications of further improvement. Jobbers are also having a better trade from all parts of the territory reached from this center. Factory lots are quoted on the basis of $2.45 to $2.50 for Galvanized and small lots from stock $2.60.

Bradley's Shelf Brackets.—The Atlas Mfg. Company have added a 10 x 12 inch size to their line of Steel Shelf Brackets. The list of this size is $6 a pair, subject to a discount of 70 and 10 per cent. They also advise us that they are putting heavier wire and steel into the goods than heretofore.

Cordage.—A fair but not heavy business in Cordage is reported. Stocks in the hands of many dealers are low, as a result of the condition of things in mercantile and financial circles for the past few months. More inquiry and an increase in business is, however, reported. Prices continue without change and with perhaps a slightly weaker tone, which does not, however, call for a change in quotations, which are on the following basis:

	Base.
Manila	$0.08
Sisal	.06½
New Zealand	.06¼

The above figures are for large lots at factory or New York. On smaller lots, such as are usually purchased by the trade, slight advances are made.

Sheet Zinc.—Under date September 12 Matthiessen & Hegeler Zinc Company, La Salle, Ill., issue another price-list and discount sheet of Sheet Zinc, quoting the advanced price of $4.25 per 100 pounds is announced for Sheet Zinc in 600-pound casks, of the thickness between Nos. 9 and 15, inclusive, and of the widths between 32 and 46 inches,

and of the lengths between 84 and 90 inches.

They also announce the following revised extras, in cents per 100 pounds:

Nos.	5	6	7	8	9	10	11	12	13	14	15
32 to 40 x 84	35	20	15	05	..	.....	.....	.....	.....	.....	.....
32 to 46 x 84 to 90	....	....	....	....	none	none	none	none	none	none	none
52 x 84	....	....	105	45	40	30	20	20	20	20	25
50 x 84	....	....	70	....	25	15	10	10	10	15	15
48 x 108	...	...	55	40	35	25	10	10	10	15	15
48 x 96	....	....	45	20	20	10	10	10	10	10	10
48 x 84	115	60	40	15	10	05	05	05	05	05	05
36 x 108	75	65	35	20	20	15	10	10	10	10	10
36 x 96	60	30	20	10	10	05	05	05	05	05	05
30 x 84	50	30	25	10	10	05	05	05	05	05	05
28 x 84	55	35	25	15	10	10	10	10	10	10	10
26 x 84	65	40	35	20	15	10	10	10	10	10	10
24 x 84	70	50	40	10	10	05	05	05	05	05	05

The extra on No. 4 36 x 84 is $0.60 per hundred pounds.

The charges for small lots and the discounts are the same as announced in the circular referred to in our last issue.

Glass.—There is an improvement noticed in the Glass trade, demand being somewhat greater and prices firmer. This is the season for placing orders for Glass, and with no home production and a limited quantity of imported Glass coming into the country, stocks are not as well assorted as could be wished. There is no immediate prospect of American factories going into operation. Indiana and Kentucky have been declared by the National Window Glass Company an open market, as manufacturers in these States felt they were not getting their share of the trade. It is stated in this connection that these manufacturers have disposed of their best Glass, so that this departure is not likely to affect the price of Glass in other hands. Some of the Plate Glass factories have gone into operation to replenish their depleted stocks. Prices remain unchanged on all lines of Glass.

Old Metals.—The market for Old Metals has been dull during the past week. Prices are irregular, and can only be quoted approximately. The demand for Scrap Iron has been disappointing, and prices begin to show signs of weakness. Asking rates are usually about as follows, but these are said to have been shaded where sales were imperative:

Heavy Copper	℔ 6¾¢
Light and Tinned Copper	℔ 6¼¢
Heavy Brass	℔ 5¼¢
Light Brass	℔ 4½¢
Lead	℔ 2¾¢
Tea Lead	℔ 2½¢
Zinc	℔ 2½¢
No. 1 Pewter	℔ 14¢
No. 2 Pewter	℔ 6¢
Wrought Scrap Iron, ℔ gross ton	$13.50 @ $14.50
Heavy Cast Scrap, ℔ gross ton	12.00 @ 13.00
Stove Plate Scrap, ℔ gross ton	7.00 @ 8.00
Burnt Iron (delivered at mill) ℔ gross ton	5.00 @ 6.00

Old Rags, Paper, &c.—The market for Old Rags, Paper, &c., has sagged off somewhat during the week, and presents a less promising aspect than was the case at the beginning of the month, due mainly to the general condition of uncertainty now existing. Paper mills are said to be well stocked up, and their operations are being carried out on a basis of caution pending the results of future financial and tariff legislation. Quotations are about as follows, delivered in New York:

No. 1 White Rags	℔ 3¼ @ 3½
No. 2 White Rags	℔ 2⅝ @ 2¾¢
Mixed Rags	℔ ¾¢
Blues and 3ds	℔ 1 @ 1¼¢
Hard Sized White Shavings	℔ 2¼¢
No. 1 White Book Shavings	℔ 1¾ @ 2 ¢
No. 2 White Book Shavings	℔ 1 @ 1⅛¢
Light Book Shavings	℔ ⅝¢
No. 1 Mixed Shavings	℔ ¾¢
No. 2 Mixed Shavings	℔ ½¢
No. 1 Printed Books	℔ 1 ¢
Ordinary Mixed Books	℔ ⅓ @ ⅝¢
Newspapers	℔ 3-5¢
No. 1 Manila Paper	℔ ⅞ @ 1 ¢
No. 2 Manila Paper	℔ ⅝ @ ¾¢
Bogus Paper	℔ ½¢
Common Paper	℔ ⅜ @ ½¢
Straw Chips	℔ ⅓ @ ⅜¢
Binders' Clippings	℔ ⅓ @ ⅜¢
Jute Butts	℔ 1⅛ @ 1¼¢
No. 1 Jute Bagging	℔ 1 ¢
Mixed Bagging	℔ ¾ @ 1 ¢
No. 2 Bagging	℔ ½ @ ¾¢
Hemp Twine	℔ 2¼¢
Manila Rope	℔ 2½¢
Jute Rope	℔ 1½ @ 1⅞¢
Mixed Rope	℔ ¾ @ ⅞¢

Old Rubber.—There is no change in the market for this material, which continues sluggish. The following quotations represent approximately the prices now ruling, New York delivery:

Car Springs, ton lots, ℔ lb.	@ $0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@ .03
Rubber shoes, less than carloads, ℔ lb	0.02¼ @ .03⅛
Large Hose, ℔ ton	@ 9.00
White Wringer Rolls, ℔ lb.	@ .04¼
White Syringes, ℔ lb.	@ .05

Trade Notes.

L. L. Rowe, 18 Howard street, Boston, Mass., is showing to the trade this season his well-known specialties, which include Rowe's Pipe Crimper, which, it is claimed, will crimp the lightest tin and No. 18 iron, and Rowe's Improved Furnace Regulator, a device for automatically regulating furnace heat.

Curtis & Curtis, Bridgeport, Conn., issue a circular illustrating and describing Brock's Patent Chain Pipe Wrench. A table of dimensions and prices is also presented on the sheet.

The galvanizing plant of the Cambridge Iron & Steel Company, Cambridge, Ohio, was put into operation last week. Very satisfactory results of the trial run are reported. These works are equipped with patented machinery, which is said to work perfectly.

Owing to the rapidly increasing orders the La France Engine Company of Elmira, N. Y., are about to extend their plant by the addition of a coppersmithing shop 42 feet square. A large amount of tools has been purchased, and the increase in the capacity of the works will probably give employment to 10 or 12 new men from the start.

At the annual election of the New York Wire Cloth Company, held recently, L. H. Root of Hamilton, N. Y., was elected president; J. Maus Schermerhorn of New York, vice-president, and F. W. DeWitt, treasurer.

The works of the St. Louis Stamping Company, St. Louis, Mo., have resumed activity. The works, when in full operation, employ about 2000 hands, who have been idle for the past two months.

The Eastern Tinware Company's factory, at Portland, Conn., is again in operation, working 40 hours per week.

The Columbia Can Machine Company have been organized at Saco, Maine, for the purpose of manufacturing and dealing in Cans of all kinds, together with tools and materials used in such manufacture, with $250,000 capital stock. The officers are: President, Clinton M. Dyer of Worcester, Mass.; treasurer, Charles F. Sanborn of Cambridgeport, Mass.

News and Notes.

The promising seaport of Newport News, Va., has added another to the list of its recommendations in the inauguration of the Chesapeake & Ohio Steamship Company, a new line of steamers to ply between that place and Liverpool, London, Glasgow and other European seaports. The line, which is virtually owned by the Chesapeake and Ohio Railroad Corporation, was formally opened on September 9, when a large party of Western business men and exporters were taken to Newport News as visitors of the company, in order to participate in the starting. This line opens up a direct through shipping route between St. Louis and Chicago and the Atlantic, and it is expected to largely stimulate the foreign trade of those cities, practically giving to the West an Eastern port of their own. It has been arranged to issue through bills of lading between the Western cities and the European ports, and handle the freight direct from the cars to the ship and *vice versa.*

It appears that numbers of the Columbian souvenir half dollars are drifting back into the Treasury after having been disbursed at their denominational rate. Large quantities of the coins remain undisposed of, and it is evident that the issue was too large.

One hundred and thirty plans for the new City Hall have been received by the New York Municipal Buildings Commission, from architects in all parts of the country. Three leading American architects have been named as an advisory committee to examine the plans and assist the commission in arriving at a decision. Six plans are to be selected for the final competition. The author of one of these will be awarded the order for constructing the new building. Its architect will get 5 per cent. of the first million expended, 4 per cent. of the second million, and 3 per cent. of all other sums. The architects of the remaining five best plans will get $2000 each.

Interesting statistics in regard to the petroleum industry of Pennsylvania are given in the recent report of Albert Bolles, Chief of the Department of Internal Affairs. The total capital invested in the oil industry of the State including vessels and pipe lines is given as $300 000,000. Pipe lines aggregating 25 000 miles have been laid and 59 tank steamers are now employed in conveying the oil abroad. The advance in cheapness of petroleum has been extraordinary. In 1861 a gallon of oil in bulk cost not less than 58 cents, and in 1892 the price was not more than 3½ cents. It is stated as a fact that a larger percentage of oil product is now shipped abroad than that of any other product except cotton.

A gold medal of the value of 1000 Italian lire is offered to open competition by the Royal Academy of Science of the Institute of Bologna, Italy, for the best memoir describing a new and efficacious system for preventing or extinguishing fires.

The "Lucania," the newest Cunarder, broke all maiden records on her recent trip from Queenstown to Sandy Hook. She promises to eclipse her sister ship, the "Campania," when she gets down to business, for record-breaking.

LABOR EXCHANGE.

FURNACE BUSINESS

FOR SALE.—Furnace has an established and splendid reputation and is covered by patents of exceptional value. No investment in plant necessary if purchaser sees fit to continue present arrangement and have goods made on a favorable contract. No old stock, bad debts or embarrassing circumstances; a good and clean deal at a bargain; a fine opportunity for a man or men who like the business and have moderate capital: the present manager doesn't like it; was 13 years in an entirely different line; has been five years in this; wants to get back where he belongs—doesn't want to sell because of "poor health," "a desire to retire" or other reason of a fakish character. Send for particulars and catalogue. Address
"FURNACE BUSINESS,"
office of *The Metal Worker*, Bank of Commerce Bld'g., St. Louis.

PLUMBING BUSINESS.

For sale.—A large, well-established and thoroughly equipped Sanitary Plumbing business of long standing. One of the largest trades in a city being sewered. Plenty of work on hand of a high grade. Will bear close inspection in all details. All the supply houses are acquainted with above business. Address
"T. J. H."
office of *The Metal Worker*, 96-102 Reade street, New York.

FOR SALE.

An old established Stove and Tin business, with stock and tools, at Thomaston, Conn. Only small capital necessary. A rare chance for a practical man. Good reason for selling. Address E. A. BRADLEY, Waterbury, Conn.

FOR SALE.

A well established Plumbing business; can give good reason for wanting to sell. Address
"BOX 578," Bristol, Conn.

Special Notices.

!!! FOR SALE !!!

BAKER BLOWERS, Nos. 1, 4½, 5, 6 and 7.
ROOT BLOWERS, Nos. 1, 2, 3, 4, 5, 6 and 7.
Sturtevant Blowers, Nos. 4, 5, 6, &c.
1 Corliss Band Wheel, 12 ft. x 24 in., in halves.
A variety of Machinery, such as Boilers, Engines, Pumps, Crushers, &c., very cheap.
Do you want to buy or sell Machinery? If so, write
C. R. BIGELOW, Machinery Expert,
45 Dey St., New York City

FOR SALE.

A valuable Stove Plant, comprising stoves, ranges and heating stoves, wood and iron patterns, flasks and fallow boards, carrying with it a large repair trade, sufficient to pay for plant in short time. Address
"INVESTMENT,"
office of *The Metal Worker*, 96-102 Reade St. New York.

FURNACE BUSINESS WANTED.

At satisfactory price and terms I would buy the manufacturing rights and patterns of a good furnace. Address
"FURNACE BUSINESS,"
office of *The Metal Worker*, 96-102 Reade street, N. Y.

ESTABLISHED 1853.

Preparing for Cold Weather.

An announcement in the reports of the United States Weather Bureau on September 26 that the thermometer stood at 10° F. in Minnesota on the night of the 25th, that ice had formed there to the thickness of ¾ inch, that a cold wave was approaching the Atlantic Coast, and that the frost line was rapidly nearing New York City, together with a remarkable fall in temperature immediately following the prediction, on the 26th, had the effect to direct public attention to yet uncompleted preparations for meeting the fast-approaching cold of winter. Usually, in the stove and heating trade, the first cold snap has the effect to stimulate the always large dilatory class and to boom trade. This year the prevailing financial depression will have an opposite effect, to some extent; but from this time on to the advent of genuine winter weather the trade will feel an added impulse. It should be remembered that timeliness is often an element of economy, and that it is generally cheaper to adopt measures of prevention than to supply cures for evils due to negligence. Undoubtedly some who have thought they could get through the winter without incurring the expense of needed attention to heating apparatus will this year have to sit in the cold while repairs that should have been made before cold weather are completed.

San Francisco Midwinter Fair.

Preparations are going on apace for the great Midwinter Fair to be held in San Francisco next winter. Five buildings are being erected in Golden Gate Park for the accommodation of the exhibits. That of the Manufactures and Liberal Arts will be a handsome structure of Moorish design, 450 feet long and 250 feet wide, with a hight of 55 feet. It is reported that intending exhibitors have applied for space in such large numbers that the management is already confronted with a serious difficulty in the provision of sufficient accommodation to satisfy all the applicants. That the fair will be a success is taken for granted, and it seems that the city of San Francisco is determined to make every effort to that end. The arrangements of the management are being made on an elaborate scale, and enough money has been subscribed to guarantee their being carried out. Doubtless such an exhibition will be an inducement to many travelers from the East to turn their steps toward the Pacific Coast this winter.

Trade Schools in America.

Professor Ripper, principal of the Sheffield Technical School, England, has lately returned home from Chicago, where he has visited the World's Fair. While in the United States Professor Ripper paid special attention to the condition of trade education in this country, and he is reported as having accumulated a large amount of information in connection with this subject, which he intends turning to account in the improvement of similar work in England. As Professor Ripper is one of the leading authorities on manual education in England, it is gratifying to find that he expressed himself on his return home as having been much impressed with the methods and appliances in use in the manual training schools of this country and with the enthusiasm for technical education which he found to exist here. The schools, he says, were generally well equipped and under the charge of men of considerable ability. Among the most notable institutions of this class which he visited was the New York Trade School, which appears to have impressed him very favorably.

The Antwerp Exhibition.

Of the making of exhibitions, as of books, there seems to be no end in these days. Extensive preparations are now being made for the great International Exposition to be held in Antwerp next year. It will cover an area of about 200 acres in the new quarter of the city, near the River Scheldt and the new docks. The main buildings are to occupy 120,000 square yards, and will have sections devoted to industrial and commercial exhibits, including machinery and electrical appliances. A concert hall to be constructed will cover 6000 square yards. The principal idea in the exhibition is to afford Europeans an opportunity of inspecting some of the exhibits which have already been displayed at the Chicago World's Fair, and numbers of exhibitors in that enterprise have consented to transfer their products to Antwerp for the purpose at the close of the Columbian Fair. Foreign governments have been officially advised of the project by Belgium, and have been invited to appoint commissioners to represent them. All inventions, patents, drawings, models and trademarks exhibited will be placed under the immediate protection of the Belgian Government, and all rights in respect of them will be secured. Goods arriving from foreign countries by the Belgian State railways will be returned carriage free over the same lines, and most of the regular lines of steamers will take exhibits at reduced rates of freight. The exhibition will be opened on May 5, 1894, and promises to be as great a success as the one held before in Antwerp. Many of the features of the Chicago Fair are to be reproduced, including a "Midway Plaisance," but the Ferris Wheel will be conspicuous by its absence.

Railroad Accidents.

An epidemic of frightful railroad disasters seems to have broken out. In the month of September thus far there have been no less than four terrible accidents, as follows: On the Boston & Albany, at Chester, Mass., in which 17 were killed and 28 injured: on the Pennsylvania, at Colehour, Ill., in which 13 were killed and 17 injured; on the Illinois Central, at Manteno, Ill., in which 8 were killed and 18 injured, and on the Wabash, at Kingsbury, Ind , in which 11 were killed and 15 injured. These accidents have occurred on some of the best railroads in the country, having the highest reputation for careful management. In nearly every case, however, the cause can be traced to some one person who either forgot something he should have done or else perpetrated a fearful blunder through sheer carelessness. Wholesale denunciation of railroad managers is quite popular now, under such circumstances, but the real culprit is the forgetful operator or the careless trainman. The best system in the world can be nullified by the man whose duty it is to carry out some petty detail.

According to a European exchange, Castelin & Camion, Mezieres, France, have constructed an aluminum launch for the French expedition to Central Africa. It is composed of 30 pieces; it is made of plates 8 to 10 inches thick, is 33 feet long and 8 feet beam, and weighs complete with wooden fittings only 1780 pounds. The same firm are constructing a number of aluminum vehicles for use in Africa, and they propose to introduce them also into the French possessions in Asia.

Modern Improvements.

BY L. M. W.

Father had always heated the old homestead with stoves, but as it was large and several rooms had to be warmed this made considerable labor and some dirt. Mother was getting along in years, we were growing up and the old house was just a little dilapidated compared with some of its more modern neighbors. Susie's beau was an architect, and had said that a beautiful old colonial residence could be made of it on a reasonable expenditure, and all of its highly prized antiquity preserved, with all of the necessary elegance added and the modern conveniences provided. Well, the carpenters and painters certainly made the old house look grand, and our John said the new bathroom beat taking a scrub in a washtub in the kitchen after all the folks had gone to bed by as much as two pair all of one kind beat a full house, whatever that meant. All of the down-stairs rooms had new ceilings that were white as snow, and with filigree and fluting around the edges they looked as inviting as a company pie.

To save all that coal and ash carrying, and ash poking and dirt, a brand-new sanitary hygiene warm air apparatus was either "instituted," or "instilled," or "installed," I don't know which, in the cellar. Anyhow, it was "sot thar," as Ezekiel said, to heat the whole house, and the "heating engineer"—I think that is what the offshoot from a stove jobber called himself—said it would furnish all through the house a balmy summer atmosphere when the weather was cold enough to freeze a fire if you forgot and left it out all night. Nickel plated registers in the floor downstairs and white and black enameled and bronzed registers were in what the girls called the pink room, the blue chamber, the guest chamber and other rooms upstairs. Pipes led from the transposer, which transformed a rip-snorting norther into a soft summer zephyr, to all the flues and registers. The "duct"—I've been ducked, but it was always in water—that brought in the raw air to be served warm as atmosphere, was nothing but a big wooden box that Jason Woodcraft made. One end took in the whole of a window, and was big enough for a man to crawl through. Well, that air duct nearly wrecked the "institution" that was "installed," so far as the family's favor was concerned.

There were some open fire places where wood was burned and the furnace that had been "instilled" was not started until winter jumped down on us one day with both feet and about 3 inches of snow. We lived near two railroads and not far from four manufactories, and as everybody had to fire up according to the weather the soft coal smut that was made was a caution. Why, before noon that snow looked like the mashed potatoes at a country dinner, it was peppered so profusely. Manufacturing had increased that summer and the air was full of soot.

Well, this same wind was awhistling through our new apparatus and out of them registers, but the house was comfortable, that is sure. One day I got notice if I couldn't brush my clothes and keep clean I had got to keep out of the guest chamber and a boy had no business to sit on a bed with a white coverlet on it, anyhow. Now, I hadn't been in that room or hadn't sat on that bed, but I had to keep still. I concluded to investigate, and watching my chance I slipped into that room, and sure enough right opposite the register was as fine a smudge on that bed as if a chimney sweep had sat in it.

The next time I was hauled up it was for throwing my cap against the ceiling in the sitting room, and though I protested I hadn't done it they showed me the spot on the ceiling as conclusive evidence of my guilt. Things were getting pretty black for the house, and correspondingly blue for me, when one day a white muslin dress that had been all done up for a party was hung on a chair in front of a register in an upstairs room. That day the wind was blowing right from both railroads where they were drilling a lot of cars and all of the factories were running at full pressure. When they took that frock off of the chair they smoothed it down with their hands and left some very plain evidences of soot.

This let the cat out of the bag and me out of disgrace and a tour of inspection followed, which found the ceilings in a terrible condition; some pictures had to be cleaned and explanation was found for a lot of dirt that had been a mystery and the cause of a lot of extra work in cleaning. Well, there was another kind of an atmosphere and the heating engineer was in it and he didn't enjoy it, for he found it pretty hot.

He suggested closing the cold-air window and connecting the box with a big register in the hall, but mother wouldn't have a hole cut in her carpet 2 feet by 3, and father remembered all he had said about "sanitene and hygiary," so he was all at sea.

The upshot of the matter was a dicker for a new steam heating apparatus, and it would have gone in if they hadn't wanted to run pipes right through the rooms, parlor and all, and to put great big iron radiators right in front of the windows where the girls want to sit. The row this kicked up caused delay, and a fellow came along about this time selling a patent wind sifter that he said would purify, rarify and indemnify the air that passed through it against "mycrobees batchalies or other imported matter." We had to have a big one, and ours is about the size of a big chicken coop and is filled with cheap dry goods, but it does the business.

Molder and Judge.

The story of the life of Isaac C. Gordon of Pennsylvania, ex-Chief Justice of the Supreme Court of the State, who died lately, is one which shows the wonderful possibilities which lie before young men in this country. Beginning life with absolutely no extraneous advantages, he began to support his family at the age of 16 by working as a laborer in an iron mill. Here he learned the trade of a molder, but being crippled by an accident and confined for months, he developed a taste for that study to which he had never before been able to devote any time. This gave him aspirations beyond his then environments, and on restoration to health he managed, while still working at his trade, to obtain a school education. Later he studied law and was admitted to the bar, entirely through his own unaided exertions. His subsequent career in his chosen profession was one of unbroken success, and was crowned by his appointment to the highest judicial office his native State could bestow.

OBITUARY.

ALEXANDER K. RIDER.

Alexander K. Rider, widely known to engineers through his invention of a variable cut off for steam engines, and also through his invention of the Rider hot-air pumping engine, which has been very extensively used for raising water in tall buildings in American cities, died at his home in Walden, N. Y., September 13, 1893. Besides being an engineer of note Mr. Rider was an accomplished foundryman. He was born January 18, 1821, came to America from England, a boy without capital, and began his career as core boy in the Phœnix Foundry in New York City. Rapidly rising to the position of foreman and thereafter to superintendent of these works, he left them to become the first superintendent of the foundry and machine shop of Hogg & Delamater, subsequently established at the foot of Thirteenth street, North River, New York, which afterward became the celebrated Delamater Iron Works. In 1854 he started in business for himself at the foot of Fifty-ninth street, New York, in a foundry and machine shop. But having received a severe injury which nearly cost him his life, and from which he never fully recovered, he abandoned this enterprise. He subsequently became the successful manager of a slate quarry in Vermont, and afterward retired from active business to a residence in Walden, where he spent the remainder of his life. During his connection with the works of Hogg & Delamater he perfected the processes of sweeping propeller molds in loam, and also of molding small propellers in green sand. He also invented the cut-off valve gear and hot air engine above named during this period. He was an exceedingly able mechanic, both with hand and head, an extensive reader, a close thinker and a man of honor and integrity in all his dealings.

OWEN MURPHY.

Owen Murphy, who recently died at his home at 631 East 136th street, New York, was born in Ireland 65 years ago and came to this country when a child. For 17 years he was in the tin and coppersmithing and plumbing business in Houston street. He rendered excellent service during the draft riots in controlling the mob and saving property. He was elected twice to the Legislature, and was a member of the School Board and Superintendent of Wharves and Piers. In 1871 he was a member of the Excise Board and its treasurer. His entire fortune of $250,000 and much trust money in his hands was swallowed up in the panic of 1872–73, after which he left the country returning in a few years to New York where he spent the remainder of his life. He is survived by his widow and six children.

The costliest mile of railroad, says an exchange, is a mile measured on the steel portion of the Forth Bridge. The length of this portion is a mile and 20 yards, and the cost of it was considerably over $10,000,000. The most expensive railway system in the world is the "Inner Circle" line of London, which cost, including the purchase of land, from $3,000,000 to $5,000,000 per mile. The last constructed mile, between the Mansion House and Aldgate, cost altogether, including "compensations," nearly $10,000,000.

WORLD'S FAIR NOTES.

The New York Belting & Packing Company

of New York, whose branch offices are located in all the leading cities of the country and have even been established abroad, have a magnificent exhibit of their specialties at Column J 27, Machinery Hall. A characteristic pavilion has been erected for the purpose. The posts of this structure are pieces of large rubber hose, with metal bands round them to which the supports of the roof and the railings are attached. The railings are a combination of rubber work, such as hose and bicycle pedals, the latter being arranged to form lattice work. Entrances are archways of rubber hose. Festoons of rubber hose are hung under the muslin canopy forming the roof. Inside the pavilion are placed in orderly groups an immense number of specimens of the varied products turned out by this company. There are columns made of belts of different widths, from 60 inches down. Other columns are composed of emery wheels. Rubber hose of many sizes is shown, including mammoth hose for high pressures. Rubber mats and pressed goods are displayed in great variety. Prominent in the display are bicycle goods, much attention being given to pneumatic tires. Samples are shown of such tires with which famous bicycle races were won. Included among the exhibits are specimens of pure rubber, shown just as they are received from the rubber-producing districts of South America.

The Ferris Wheel Profitable.

The great Ferris wheel has justified the faith of its designer and those who backed him with their means. It has paid the cost of its construction and will now yield dividends to its owners. When the concession for the wheel was granted the Ferris Wheel Company were permitted to take in $300,000 before they began paying any percentage to the Exposition Company. This mark was passed September 8, with $3000 to spare. Hereafter 50 per cent. of the receipts will be turned over to the Exposition Company. The daily average business for the wheel has increased gradually until the receipts on the 8th were $8000.

The Capitol Mfg. Co.

of Chicago make a fine exhibit of bolt-cutting and nut-tapping machines at column L 41, Machinery Hall. These consist of a Cook automatic nut-tapping machine, two double-head and three single head bolt cutters, and a machine for threading and cutting off small pipe. The nut tapper is exhibited at work on ¼-inch nuts, needing no attention from the operator except to fill its hopper with blanks, and turning out completed work with marvelous celerity. The bolt cutters shown cover a range of work from $\frac{3}{16}$ to $3\frac{1}{2}$ inches, all making the thread with a single cut. The pipe threader is new. It will cut and thread pipe up to $2\frac{1}{2}$ inches. The pipe dies are inserted in an Adams head of the kind used on the bolt cutters. Another head has a two-jaw universal chuck. Between these heads is a movable carriage having jaws to hold the pipe, which can be passed entirely through the machine, as the spindles of both heads are hollow. The spindles are operated by independent clutches.

Northampton Emery Wheel Company

of Leeds, Mass., make an excellent exhibit of grinding machinery at D 53, Machinery Hall. They show a great variety of machines for edge and surface grinding, shaping, interior and exterior work, single wheels, double wheels, &c. With the exception of a very few these machines are shown belted up and ready for operation. Their Chicago office is at 20 South Canal street.

The Springfield Emery Wheel Company

of Bridgeport, Conn., occupy space at Column E 52, Machinery Hall. They make all kinds of Emery Wheels for all purposes, and their exhibit includes several pyramids of such wheels to indicate the character of their product. The feature of the display, however, is grinding machinery. They are builders of the heaviest grinding machinery in the world, and consequently make some notable exhibits in this line. An automatic knife-grinder for planing mills, grinds knives up to 144 inches in length. Water is used on the wheel to prevent the drawing of the temper from the knives. It requires no attendant after the knife is set and the machine set in motion. Another automatic knife-grinder has the base and bed in one casting, which makes it very rigid and free from vibration. There are two water tanks in the base of this machine. A centrifugal pump takes water from the lower tank and sends it through pipe connections directly on the knife where it is being ground. The water then runs down into the upper tank where the sediment settles, and the clear water overflows to the lower tank. A large tool grinder is shown which also has a base and bed cast in one piece, with tanks located inside the base. A No. 3 surface grinder exhibited resembles in appearance a metal planer, the Emery Wheel being attached to the crosshead, which is raised and lowered by a belt from the countershaft. It is designed for grinding boiler fronts, but is adapted to grind any wide articles. The platen is propelled by a worm and worm gear connected to a large screw running through the center of the bed and connected to the platen by a long clamp nut, which gives a steady movement to the carriage, preventing vibrations that would impart a wavy look to the work. Two of these machines and two tool grinders were sold in the spring to the Chicago, Burlington & Quincy Railroad. A small floor grinder is shown, carrying two wheels up to 10 inches in diameter; another, somewhat larger, carries two wheels up to 20 inches or four thin wheels. A 60-inch automatic knife grinder is a heavy tool designed for grinding shear blades, veneer knives, planing-mill knives, &c. Three different styles of emery wheels are used on these machines to suit the different classes of work to be done by them. A special field of usefulness for these grinders is opening up in plate rolling mills. When plates are cut to size or in special shapes the edges are squared or trued on these grinders, accurate and speedy work being done with a minimum of time and labor. Lack of space prevented a car-wheel grinder from being shown. This is a tool for grinding partly worn wheels into shape for continued use. It grinds wheels on or off the journal at the rate of ten pairs per day. The company have a Western agency at 125 South Clinton street, Chicago.

The Compress Wheel Company

of 149 and 151 Huron street, Chicago, make a good exhibit at A 53, Machinery Hall, of their special style of wheels for polishing and buffing. They are shown with faces made of a variety of materials. A high column is erected, comprised of 32 wheels mounted on spindles, attached at right angles to a central support consisting of a stout wrought pipe. These wheels are shown in a variety of sizes.

C. E. Le Massena & Co.

of 776 Broad street, Newark, N. J., exhibit a showcase at B 50, Machinery Hall, containing many specimens of their solid leather polishing wheels, cones, paper wheels, &c. The leather wheels are made of disks of new oak tanned leather put together with elastic waterproof cement under heavy hydraulic pressure. They are turned to any shaped face, beveled, concave or convex. The material used resembles the finest walrus or sea-horse leather, but is much more economical. These wheels are in use for stove work, cutlery, plows, edge tools, saddlery hardware, nickel goods, jewelry, &c., and are made hard, medium or soft and medium, according to the service to which they are to be put. The paper wheels have emery or corundum applied to the face, are designed for roughing or hard cutting, and are much cheaper than solid emery wheels. Specimens are shown which have been in constant use over two years and are still in good condition.

Otto Gas Engine Works,

Thirty-third and Walnut streets, Philadelphia, and 245 Lake street Chicago, make a large exhibit of their engines at H 31, Machinery Hall. Of these, one 100 horse-power, one 50, one 16, two 7 and one 1 horse are shown in operation. In addition, the exhibit comprises one 15, one 2 and one ½ horse-power gas engines, and one 17 horse-power gasoline engine. These engines may be run with an electric spark or a tube igniter, as preferred. In this exhibit both methods are shown. The tube igniter has patent controlled valves which regulate the time of ignition, prevent premature firing, and thus avoid starting backward. The electric igniter is also a patent device, and is not, as formerly, a perishable part of the machine. By an automatic arrangement the batteries are cut out every time the engine is stopped, and thus protected against running out while the engine is standing. The 50 horse-power engine is shown with a self-starter, which is a hand pump by which a mixture of air and gas is forced into a receiver, whence it passes into the cylinder and starts the engine without the application of hand power to the fly wheel. This was tested in the presence of the writer and required but three-fourths of a minute to get up full speed. The gasoline engines are adapted for use in localities where gas is very dear or cannot be obtained. One gallon of gasoline per horse-power will run an Otto gasoline engine ten hours. Otto gas and gasoline engines are also shown in the German department in Machinery Hall, and a 17 horse-power portable gasoline engine is exhibited in the Agricultural Building. There are now 40,000 Otto engines in use, having an aggregate of 250,000 horse power.

THE LETTER BOX.

Improved Furnace Top.

From A. L. BURTIS, *Lockport, N. Y.*—In *The Metal Worker* of September 23 I am pleased to find a criticism from A. W. Giessner on my furnace top, but judging from his letter I do not think he quite understands what my idea is. The iron standards he speaks of as being in the way are for the purpose of supporting the top independently of the sides, and as there would not be any cutting in of collars they certainly would not be in the way. He must bear in mind the fact that with this construction the different sections, some with collars and others without, are to be placed on the top and are made to slide around to any opening most favorable to the register. Where there are no openings required insert a blank. The sections could be made by machinery and finished with a nice-fitting damper with an air space, and could be carried in stock by the furnaceman as are elbows, register heads, &c.

Heating Room From Water Back.

From M., C. & S., *Towanda, Pa.*—Will *The Metal Worker* tell us whether or not a 5-foot range with a water side 22 x 10 inches and a fire box 22 x 12 x 10 inches deep will heat a 42-gallon boiler and a coil of 100 feet of 1-inch pipe with open pattern return bends, and an air cock at the highest point, as shown in the sketch?

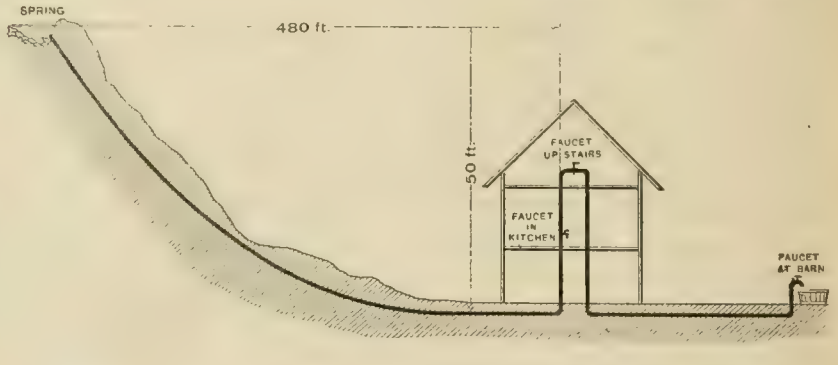
Answer.—It is not necessary to give the sketch, which shows the coil just above the level of the top of the water back in another room. From Y-branches in the pipes between the water back and the boiler pipes connect with the coil. The hot-water or flow pipe runs straight up to a point just below the top of the coil, when it runs to the coil with a gradual pitch. The return pipe has a downward pitch from the coil to the branch. The sketch shows a stairway between the coil and the boiler, which necessitates an offset in the pipes to pass it. An angle valve is placed at the inlet of the coil so that its use can be discontinued when not required for heating, and an air cock is placed at the other end of the coil. With this explanation of the conditions they are readily understood. No data exists giving the heating capacity of water sides, or water backs, as they are generally called, but much smaller water backs in smaller fire boxes heat the water satisfactorily in boilers twice the capacity mentioned. We think no trouble will be experienced from that source. When the room to be heated is on the floor above the range there is little difficulty in securing good circulation, but with the room on the same floor trouble is often experienced. Circulation is best when the radiator is well above the boiler, or, as in this case, the water back. The difficulty in the present instance can be remedied by connecting the flow pipe to the coil with the hot-water service at the top of the boiler or running it up from the branch nearly to the ceiling and then around to the coil before dropping down and making connection. The air cock must then be changed from the coil to the highest point in the flow pipe. Such a change will facilitate the circulation and better heating will result.

Difficulty With Pipes From Spring.

From A. & S., *Owego, N. Y.*—Can *The Metal Worker* or its readers tell us how to overcome the difficulties in these two separate jobs of plumbing on farms? In Fig. 1 the spring is 40 rods from house, with a fall of 50 feet. A ½-inch pipe runs from the spring into the house, through the kitchen to an upstairs room, where it returns and runs to the barn, with a faucet at each point. No water runs from the kitchen faucet when the upstairs faucet is closed. If the upstairs faucet is opened there is no trouble to get water in the kitchen, but the moment the upstairs faucet is closed the flow stops in the kitchen. How can we get water at both places at the same time when necessary, or in the kitchen when the upstairs faucet is closed?

On the second farm the distance from the spring and the fall are the same and there are faucets at the same points, the only difference being in the kitchen arrangement, which is shown in Fig. 2. Here a short return is made with a piece of 1-inch pipe. The supply from the spring connects at the top of this 1-inch pipe and at the bottom is the faucet and the pipe that leads upstairs, which then returns and runs to the barn, but in this case no water will run from any of the faucets. How shall we overcome the trouble and what is it caused by?

Note.—The piping in both cases is so arranged that air can collect in the loop that runs upstairs and returns and runs to the barn. In the second case the air pocket is duplicated in the arrangement in the kitchen, which would strengthen the belief that air is the cause of the trouble. This can be remedied by doing away with the loop and simply taking off a branch to supply the house faucets, when there will be no opportunity for the air to collect.



Difficulty with Pipes from Spring.—Fig. 1.—Arrangement at First Farm.

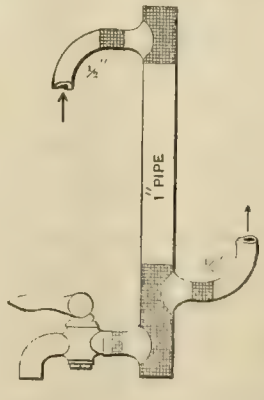


Fig. 2.—Kitchen Arrangement at Second Farm.

Single vs. Double Heating Pipes.

From CÆSAR, *Louisville, Ky.*—I noticed article of "W. E.," Orange, N. J., in *The Metal Worker* of September 16 in reference to wire lathing. In answer I would say that wood lathing in contact with heated pipes shrinks to such an extent that the plastering cracks from the floor to the ceiling. There is no other reason that I can find for using wire lath on well-made double pipes.

Water Backing into Sinks.

From C. P. J., *Dover, N. J.*—Can *The Metal Worker* tell me why the water backs up in a sink that has a 1½ inch pipe with a McClellan vent on it. When I take off the vent it will work all right, but when I put the vent on again it will work for three weeks or a month, when the water will back up in the sink again. It has done this three times and the pipe is clear. I would like to know the cause of the water backing up.

Answer.—There is nothing in the device mentioned that would locate the trouble described, but as it does not "back vent" it would permit the pipe

to become air bound in case of another trap on the same pipe, or, though the pipe is said to be clear, of some partial stoppage that might be the accumulation of hardened grease that reduced the bore of the pipe or of lint which would let the water filter slowly through. In either case the air in the pipe would be compressed and prevent the water received by the sink from running off though the sink became full. Removing the vent under such conditions would release the air, when the water would pass off with a rush that would remove any slight obstruction.

Remedy for Bad Flue.

From CÆSAR, *Louisville, Ky.* — I would like to hear from the practical readers of *The Metal Worker* the best way to improve a bad chimney. I have a contract to place a furnace in a store where there is a 4 x 18 inch flue built within a 13 inch wall. The owner of the building has never been able to get a common stove to work properly with the flue, which is practically worthless. The building is two stories high, and the chimney is 8 feet higher than the roof, and free from surroundings that would affect it. The chimney now stops at pipe hole about 5 feet above the floor, and it must be carried down to the cellar, but must be kept within the 13-inch wall. Can the flue be made to work without tearing out and rebuilding, and if rebuilt can it be kept within the space?

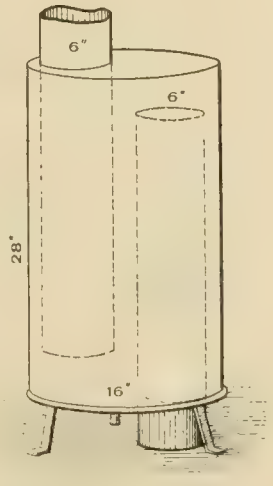
Note.—Experience has shown that wide, shallow flues, though they have a large area, are of little or no value. An 8 x 9 inch flue would have exactly the same area, and it is quite certain that not only the stove would work with it, but that a furnace connected with such a flue would render good service. It is doubtful if any remedy would make the present flue satisfactory except cutting out its face from top to bottom. This would give a space 8 inches deep, into which a terra-cotta pipe could be placed, and plastered over, making a finish. Terra cotta being rather thick, would hardly give a diameter of even 7 inches, which is rather scant, and it is probable that some of the manufacturers of such goods could supply a flue 7 x 13 inches, or some size that would come within the space. If it was not for the heat of the flue cracking the plaster, a 10-inch pipe, made of No. 18 or 20 iron and flattened to go in the space, would make a good flue. By careful building and plastering on sheet-iron lath this last trouble might be overcome and the flue kept within that space. Such a flue would last for years, and when the iron finally was destroyed the plastering around it would serve as a flue for a long time. These are but expedients we have suggested. The best plan is to rebuild the chimney and provide an ample flue.

Learning the Boiler Trade.

From F. A. K *Pennsylvania.* — I wish to learn if there is any trade school where the boiler trade is taught.

A Heating Drum.

From H. W. W., *Le Mars, Iowa.*— As it is time to think about getting up heaters I send herewith a sketch of a drum that I have made for 14 years and have found to be the best heat-saving device I have ever seen for hard coal or wood. I do not think drums can be successful with soft coal, as it fills them up with soot so quickly and they have to be cleaned so frequently. I make the drum of Russia iron, 28 inches high and from 14 to 17 inches in diameter, or of smooth black iron 24 inches high and 16 inches in diameter. I continue the pipe or collar on the bottom of the drum upon the inside to about 6 inches from the top and the outlet pipe at the top of the drum is carried down to within 6 inches of the bottom, as shown in the sketch. This brings the hot smoke to the top of the drum, so that a pan of water can be easily warmed, then the smoke gives off its heat to the drum as it falls to the



A Heating Drum.

bottom and passes off through the outlet. The legs are made of the straps that come around bundles of sheet iron and should be about 6 inches high.

Information Wanted on Laying Water Pipes.

From C. E., *Davenport, N. Y.*—I would like to submit the following questions for consideration in the Letter Box. Please explain how the sizes of water pipes are determined and how they are put in where there is a very great fall; are reducing pressure valves used or is a reservoir used part way down the system? How do such valves work? I ask these questions on a case where there is a large body of water at a great elevation. In laying pipes under such conditions is it a practice to use larger pipe near the supply? If so, how is it done, and why? In figuring on pressure what per cent. is calculated for friction on the side of a pipe? I am about to lay 150 rods of ¾ inch iron pipe with about 100 feet of fall. Will not the water run slowly at the lower end owing to the pipe being pretty small?

Answer.—The sizes of the pipes are determined by the quantity of water required and the method of its discharge—viz., if for a closed system the condition of velocity of flow under the maximum requirement and loss of head by friction are considerations of importance. If for a free flow with an open end pipe, the amount that will flow by gravity regulates the size of the pipe to the required quantity. There are two systems for high-grade water service: an open reservoir at the proper hight for a town supply with an open feed and overflow, or a closed single-pipe system with a regulating valve at the point of distribution. The later forms of regulating valves seem to work satisfactorily and many are in use on public and private water works.

The pressure in a water pipe is due only to the hydrostatic head or hight of the source of supply and not to the size of the body of water. This is equal to 0.433 pound pressure per square inch for each foot of vertical hight. The best practice in a water works system for the greatest possible flow of water is to graduate the line according to its length and hight into two or three sections, increasing by one gauge larger pipe, ascending, thus giving a free entrance of the water at the inlet so as easily to overcome the inertia of the water at the moment of entrance. To further facilitate the easy flow of water into the pipe the inlet end should be conical for a few feet, so much as to give the entrance about double the area of the pipe. These points do not affect the pressure at the delivery end when no water is flowing, but they largely increase the pressure when a large quantity of water is required, as for fire purposes, by lessening the friction and maintaining the greatest hydrostatic head under full flow.

The friction of water in pipe depends upon three factors—velocity, diameter and length of pipe, so that no single percentage will answer the question.

The formula for the head lost by friction is somewhat complex and stated as follows: Lost head =

$$\left(0.0144 + \frac{0.01746}{\sqrt{v}}\right) \times \frac{l}{d} \times \frac{v^2}{5.4}$$

in which v is the velocity in feet per second, l the length of pipe in feet, d diameter in inches. By this formula it is noted that the friction head is an inverse ratio of the diameter for given velocities —*i. e.*, the friction loss of a 1-inch pipe is twice as great as for a 2-inch pipe for equal velocities, but the 2-inch pipe will deliver four times the quantity of water at the same velocity and five and one-half times more with equal heads and free flow. The discharge from the ¾ inch pipe with length and hight as stated, with open end, should be 3.45 gallons per minute. The formula being, constant for ¾ pipe = 2.32 :

$$\sqrt{\frac{2500 \text{ feet}}{100 \text{ feet head}}} = \frac{2.32}{5} = 0.46 \text{ cubic foot} \times 7\tfrac{1}{2} = 3.45 \text{ gallons.}$$

If our correspondent's requirement should be somewhat more than above we recommend 1 inch pipe for one-third of the distance from the head, which will give an open flow of nearly 6 gallons per minute.

Furnace Setting.

BY PRACTICAL, SYRACUSE, N. Y.

It has come to be a saying among furnacemen that there are no two furnace jobs alike, and practically it is true. For there are circumstances and conditions connected with every job that differ from any other; hence the difficulties that many dealers experience in furnace work. It would be impossible, therefore, to lay down any series of rules for setting furnaces that would cover every particular job. But I think a few general rules and explanations may be given which, together with a little experience and ingenuity, will help the inexperienced out of some of their difficulties.

What I understand by furnace setting is the putting up of furnaces, with their pipes, registers, cold-air boxes, &c., complete, ready for use. As different classes of buildings require somewhat different rules for setting, we will consider in this article furnace setting in private houses. As the stacks (or partition pipes, as they are perhaps more generally known) have become a prominent feature in furnace work, and are usually the first and many times the most difficult part to put up, I will take up that portion of the work first. It is my experience that the best style of pipe to use, all things considered, is what is generally known as square pipe. As I gave a detailed description of the sizes most profitable to use, and the manner of making the same, in an article in *The Metal Worker* of March 12, 1892, we will assume that to be the style used. One of the principal advantages of that style of pipe is the convenience with which regular and special fittings, such as elbows, tees, offsets, &c., can be made, which is quite an important item where any amount of work is done; and by confining himself to one or two sizes of pipe the furnaceman can have a certain number of the regular fittings made up during the dull season and save much time when the rush comes.

To assist in the explanations of the use of the different fittings I have included in this article sketches of some of them. The names by which I shall designate them may not be familiar to all, but I trust will be clear enough to be understood. Fig. 1 is a regular offset, Fig. 6 a regular elbow, Fig. 4 a regular tee, Fig. 2 is what we call an irregular offset or an offset made to offset the pipe the narrow way, Figs. 7 and 5 are irregular elbows and tees respectively.

The irregular fittings are seldom used, but when wanted they are wanted as badly as if they were used every day. The regular offset is used, as its name indicates, to offset the pipe over a timber, either sill or floor timber, as shown in Fig 9. This figure represents the partition through which the pipe is run as standing on a cross timber. No builder would allow you to cut it off or notch sufficiently for the pipe, but by using the offset only a small part of the timber is cut; not enough to weaken it. As will be noticed, the upper part of the offset is made as short as possible in order to get it through the opening in floor over timber. The lower end is left long enough to extend below the floor timbers far enough to receive the collar, as shown. This is the collar to receive the leader from the furnace and should not be the ordinary straight collar, as the pipe being narrow would retard the easy flow of air from the furnace into it. It should be, therefore, a short tapering or flaring collar as shown in Fig. 8. Supposing the leader to be 8 inches, the collar should be 8 inches at one end and 9 inches at the other where it is let into the stack, and the collar short and the flare principally at the top, as shown. As will be seen, this collar can be placed on either side of the offset to suit the convenience of the leader; or if the furnace was so located that the narrow way of the pipe should face toward it then carry the leader along in front of the pipe and turn in collar with elbow; or else use a side inlet, as Fig. 3, using straight col-

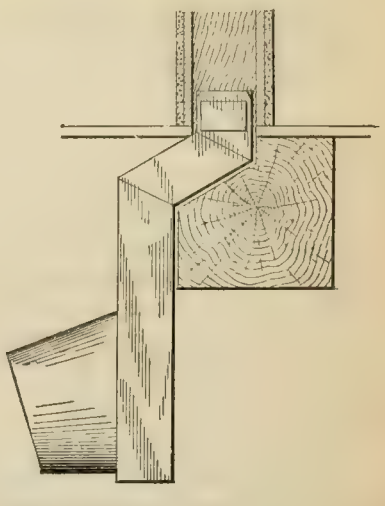

Fig. 9.—Offset Over Timber.

FURNACE SETTING.

lar in side, as shown by dotted lines. Another very convenient and practical fitting is shown in Fig. 10, which I call a bevel inlet. The use of this fitting will do away entirely with the offset and collar. It will require a little more cutting of the timber, but could not be used if the furnace was located so that the leader would run to it from the back side; but where it can be used it provides for a very easy flow of the air. As will be seen, this fitting is made square at one end, with a bevel and tapering to a round at the other. Of necessity it must be short, so that the leader entering it may come up close to the timbers. Of course pipes cannot be put up without cutting, more or less, the timbers and floors, and one of the objects of these fittings is to avoid cutting as much as possible, and at the same time get the pipes as you want them.

Furnacemen frequently come in contact with builders who are very particular about what cutting is done, and we have to manage the best we can to keep on their blind side. In cutting the holes for pipes they should always be cut at least 1 inch longer each way than the size of the pipe to be used, to allow for lining and air space. If the partition through which the stack is to pass runs across the timbers, you have simply to cut a hole through floor between the timbers and through the trimmer at top between the studs, and they are ready for the pipes. In this case no offset or bevel is needed, and the tapering collar can be used, or a straight inlet, Fig. 14. This is simply a short tapering piece of pipe, square at one end and round at the other, and the size required for the leader entering it at the bottom, with elbow at any angle with the furnace.

It is frequently the case, however, that the partition on second floor is not set directly over the one below. There are different ways out of this trouble. One is, if the distance is not too great, say 4 or 6 inches, to use regular offset and side wall register, as shown, Fig. 11 If the distance is more than that and you wish to use side register, use two regular elbows with short piece of pipe between, as shown in Fig. 15. If it is desired to use floor register use one elbow and carry over as far as required with pipe; close the end and use register head for floor register, as shown in Fig. 12 In either case, if the pipe runs between timbers give the horizontal pipe as much elevation as possible, but where it runs across timbers not so much can be given, as it would weaken the timbers to notch them the required depth. Hence a horizontal pipe running between timbers can be run further than one running across timbers But as a rule, good results cannot be obtained from a horizontal pipe running between floors further than 6 feet.

Again, it is often required to heat two rooms from one pipe; where side registers are used the same fittings can be used as in the previous cases by putting in two register heads, and where these are used there should always be a partition between them extending through the center of pipe from the top to 2 or 3 inches below the bottom of heads to provide an equal division of the heat, and also to prevent occupants of the rooms looking through from one room to the other. Where floor registers are to be used, use the regular tee, Fig. 4, and branch each way. These branches, to give equal results, should be of about equal length, or a partition placed in the tee extending down 3 or 4 inches into the pipe, or the branches of the tee can be made a little smaller than the upright. In all cases where two rooms are to be heated from one pipe, the pipe should be of larger size than for one room and the branches about one and one-half in total area the size of upright.

Another difficulty we find sometimes is that the studding in the upper partition is not set over those below, and we have to carry the pipe over the narrow way 4 or 5 inches; then comes into play the irregular offset, Fig. 2, and we get the pipe where we want it easily and without cutting or affecting the easy flow of air. Again, we find the only available space in the lower partition will come up under a door on second floor and we cannot run out with elbow and floor register, as that would bring the register directly in front of door, which should be avoided. In that case we use the regular elbow and carry over far enough to reach the first space in floor timbers, then with irregular elbow we turn at right angles and go far enough to clear door and use floor register, as shown in Fig. 13.

There are many other difficult places that the furnaceman will meet that these fittings will help him out of, or, if they do not just meet the case, they will suggest to him some special fitting that he can make that will.

In all furnace work avoid square angles and sharp turns. It is sometimes necessary to use a square pipe collar, but do not use a straight collar when a flaring collar, Fig 16, is easily made and will give much better results. Before any pipe is put up provision should be made for lining. There are different ways of doing this. Some line with tin and some with asbestos paper, and others with both. Where tin lining is used all wood work that is exposed to the pipe is supposed to be covered. One way of doing it is first cut enough strips 4 inches wide the 28 inch way of the sheet, cutting one from each sheet, to line the inside of the studding both sides from top to bottom, then put up the pipe, beginning at the bottom, fastening the fitting, if any is used, firmly in position first. Then connect pipe and put up complete, being sure that it is fastened firmly and all the connections soldered as tightly as possible. Then, using the balance of the sheets from which the strips were cut, which will be 16 inches wide, nail over the space between studding.

Another way of lining is instead of cutting off the strip bend up to 4 inches on each side of the sheet, square and nail between studding, thus forming the lining for the studs and one side at the same time. However, I do not think it gives an opportunity of putting up the pipe as well as the other. Where asbestos paper is used for lining, the usual way is to wet the paper in water and wrap it tightly about the pipe, and when allowed to dry it will stick. Some, to be more sure, put it on with paste. Care should be taken in putting up the pipe to see that it is not jammed or turned in at the connections, thus reducing its capacity; for no matter how large the pipe may be, its capacity for delivering air into the room is determined entirely by its capacity at its smallest point.

FURNACE SETTING.

PLUMBING and GAS FITTING.

Back Venting.

From THOMAS HYDE, *Albany, N. Y.*— I have been reading with a great deal of interest the discussions, pro and con, on back air venting. The principal argument used, the danger from evaporation by the velocity of air passing through the ventilating pipe, and the greater the velocity and evaporation there was, the greater the danger is considered. The caliber of the parties discussing this subject is such that I don't desire to take issue with them, but simply want to ask a few questions. If, as is stated, in regard to the high velocity in high buildings the velocity becomes so rapid, what harm can come to the occupants of a room where the trap of an apparatus has been unsealed? How could anything but good results come out of it? Would not the air from the room pass down through the trap and help to purify the air of that room rather than permit the foul air from the sewer to come in? This, it seems to me, would be the case Where a back air vent is properly located a constant current must pass up through it. In the second edition of Hellyer, page 279, I find these words: "The work of the sanitarian will never be done until he can so scheme, either with or without mechanical appliances, that a constant change of atmospheric air shall be made to take place not only in every bedroom, living room, bathroom, water closet and housemaid's closet, but also in every waste pipe, drain or closed space where the air is likely to become contaminated." After reading the above I set to work to bring about that condition of things in my own house, and the result is that I have no fear of sewer gas entering my apartments. I proved this many times by severe tests, and have followed that rule in many places since, always proving a trap to be really unnecessary. In regard to the stopping up of the back air vent with soap suds, grease, &c., as stated, I believe that there is not so much of it as is imagined.

Newark Plumbers.

On Tuesday night, September 26, in response to an invitation from the Master Plumbers' Association of Newark, N. J., a large number of the plumbers from Essex County attended a special meeting, the object of which was to make preparations to join the National Association. Vice-President John Mitchell of the National Association was present, supported by Edward Murphy and others from New York. The meeting was generally regarded as a success, and there is little doubt but these plumbers will be enrolled as members of the national body at an early date. The meeting dispersed to a banquet spread by Caterer Isaacs, where as many good things were delivered by the orators as were devoured by the silent worker, who wore his honors with a satisfied composure.

AT A RECENT MEETING of the master plumbers of Cambridge, Mass., J. T. Phelan of Harvard Square presided. The Master Plumbers' Association was organized for mutual protection and the advancement of matters of common interest.

TRAPS AND VENTS.

FROM A SERIAL ARTICLE contributed to a London exchange we quote the following paragraph sketching the condition of plumbing in England before modern progress got hold of it: "Thirty years ago in many towns of the United Kingdom one, two or three firms of good old-fashioned substantial plumbers flourished, following the substantial plumbing practice in their trade, and charging old-fashioned substantial prices for good, sound work. Handmade solder-seamed lead pipes, bends, and traps were made by easy-going plumbers in the workshop when work was slack, filling up time nicely until orders came in again. D-traps were esteemed and pan water closets honored by the observance of the plumbing trade. Ventilation of soil pipes and waste pipes was quite neglected or unknown. The drains were laid by the builders' laborers or masons in whatever shape or form came handiest, and the plumbers connected their pipes direct to these drains free from all thought of responsibility."

WILLIAM L. WHIPPLE, Manton avenue, Olneyville, R. I., is busy with plumbing work. His men are now working on three new residences.

A. F. POWERS of Boston has secured a store in East Braintree, Mass., and will open it as a plumbing and gas fitting establishment.

WE LEARN FROM JOHN FORAN, iron founder, maker of sinks, soil pipe, fittings and plumbers' supplies, that he has purchased the Flemington, N. J., foundry property formerly owned by Robert Johnson, and will remove his Quakertown plant there in a few weeks.

THE MALDEN, MASS., BOARD OF PLUMBING Examiners consists of Chairman John E. Staples of the Board of Health, Inspector of Buildings C. N. Bishop and B. O. Tilnen, who is a practical plumber. An effort was made to secure some practical plumber for plumbing inspector, but as the law requires him to give up business none could be found to accept the offer under $1200 per year, and the inspector of buildings will attend to these additional duties for an increase of $200 to his present salary. The board announce they are ready to begin the examinations and the plumbers must pass or discontinue business in Malden.

A NEW COMPANY recently incorporated for the manufacture of plumbing supplies is the Daniel McKay, Jr., Company of New York.

"A PAIR OF NIPPERS and half a dozen 18-inch gas-burner tips," was the order given by a jaunty young woman who visited an up-town plumber's shop the other day. "That lady," said the proprietor after her departure, "is an actress, and is just going on the road. All theatrical people while traveling carry nippers and tips with them. The managers of hotels in small towns try to save gas by putting bits of cotton in the bedroom burners, thus impeding the flow. The minute the actor strikes a light and detects this he pulls out his nippers and tips. Off comes the 'faked' burner and on goes one that lets the full head of gas come through. Before leaving he arranges things as he found them and goes merrily along to get the better of the next economical landlord on his route."

THE BUILDING INSPECTOR of St. Paul, Minn., finds that the city is losing a considerable revenue through the plumbers failing to take out permits for doing their work. The fee for the permit should be collected from the owner of the building and in future the inspector will be more stringent in requiring the plumber to take out his permit, in order that the city may collect its fee.

THE JOHN D. PAGE COMPANY have recently been incorporated, with a capital of $2000, to do a general plumbing business, with an office in New York City.

AMONG THE PROMINENT PLUMBERS whose names appear on the register at Peck Bros. & Co., 259 Wabash avenue, Chicago, are the following: Edward D. O'Connor, Louisville, Ky.; James McGauly, Indianapolis, Ind.; Alex Gray, Kansas City, Mo.; Fred Lamping, Cincinnati, Ohio; James Foley, Leavenworth, Kan.; Fred P. Terry, Ansonia, Conn.; E. McNalley, Oswego, N. Y.; Tobias Ruheudel, Columbus, Ohio; W. B. Coffee and Wm. Welsh, Tacoma, Wash.

TREASURER E. W. ANTHONY of the Smith & Anthony Company, Boston, manufacturers of the Sanitas plumbing specialties, recently paid a visit to Manager C. E. Stevens, at the New York office at 56 Beekman street.

A FEATURE of the Nautilus water closet, made by the W. S. Cooper Brass Works of Philadelphia, and displayed at their New York showroom, at 43 Beekman street, is the seat, which is secured to the closet and balanced by weights so that it stands upright when not in use.

THE CHICAGO MASTER PLUMBERS held their regular meeting at their hall, 197 Madison street, Monday evening, September 25. A feature of the meeting was a discussion regarding the advisability of having a certain day at the World's Fair for the plumbers, gas fitters and kindred trades. The matter was not decided.

MAYOR HARRISON has notified T. P. Culloton, M. J. Carboy, D. J. Rock and A. W. Murray, prominent plumbers of the city, that they are to serve on the Finance Committee of the Chicago Labor and Temporary Relief Committee.

J. L. ELLIOT has purchased the plumbing, gas fitting and sewerage business of A. F. Bock, 272 Fifty-fifth street, Chicago.

THE RECENT FAILURE of Louis Roller, 161 St. Nicholas avenue, New York, is the subject of considerable talk among

the trade. While the amount of his indebtedness is quite large, several firms being creditors for from $1000 to $4000, the finding that he has forgde several notes is the cause for disagreeable doubts in some houses. An $800 note in one case that was found to be good gave considerable relief.

THOS. H. RADCLIFFE, president of the Brooklyn Association of Master Plumbers, is making an effort to get the plumbers of Long Island together for the purpose of forming an association.

THE WILMINGTON, DEL., plumbers are about organizing an Association of Master Plumbers to affiliate with the National Association.

THE SCHOOL BOARD OF ATHENS, N. Y., recently voted to appropriate $1000 for a steam heating apparatus for one of the schools.

THE BOARD OF HEALTH of Springfield, Mass., are revising the plumbing ordinances of the city to conform with the new State law.

THE PLUMBERS OF MACON, GA., are making earnest efforts to have the city authorities appoint a regular plumbing inspector. They also wish an examining board of plumbers, so that no one can do plumbing work unless he is qualified. The plumbers intend to bring this matter to the attention of the Board of Health at its next meeting, in order to prevent a continuance of the defective work which is found in many houses and stores in that city.

THE BOARD OF HEALTH of Rutland, Vt., has been making an inspection of the sanitary arrangements of the buildings in that city and has found much that will require changing, and it is possible that some plumbers, as well as citizens, will be brought before the court for violations of the city ordinances relative to the plumbing and sanitary arrangements.

THE NEWARK LEATHER WASHER MFG. COMPANY, 165 Mulberry street, Newark, N. J., make a specialty of valves and plungers for pumps and leather washers for unions for plumbers' use.

THE ESSEX LEAD WORKS, 46 Mechanic street, Newark, N. J., have found a satisfactory demand for their special make of lead pipe and line of plumbing supplies all through the season.

W. B. EGBERT & Co., 35 Mechanic street, Newark, N. J., carry a large line of plumbers' specialties and supplies, and find the trade in a very satisfactory condition.

ON THURSDAY, SEPTEMBER 28, P. H. Gavin, a well-known plumber of Quincy, Mass., died at the age of 48 years. He served in Company D, Thirty-ninth Regiment of Massachusetts Volunteers during the war and was a member of the Paul Revere Post G. A. R. He was one of the yachtsmen of the Quincy Club and a member of the Knights of Pythias. A wife and nine children survive him.

A SPECIAL JOINT MEETING of the Board of Health and Board of Plumbers at Rome, N. Y., recently, resulted in the adoption of a code of rules to govern plumbing and drainage in that city.

THE WILLIAMS BROTHERS, Crawfordsville, Ind., have moved their plumbing establishment to their new room in the Crawford Block.

Portable Drilling Machine.

The accompanying illustrations represent a portable drill sometimes called Scotch drill, which is being introduced by O. C. Crane, No. 16 Bridge Arch, Frankfort street, New York. As shown in Fig. 1 the clamps may be fastened to a bench, beam or other object 6 inches thick, or less. The standard is held in

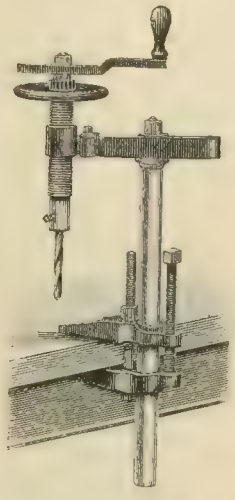

Fig. 1.—Portable Drilling Machine.

the clamps by set screws with jibs, which is an advantage in applying the drill to the work, as they allow the standard to be moved through the clamps without loosening the clamps from their place. The standard is made of pipe of 1½ inch diameter, 21 inches long, thus combining lightness with rigidity. The drill spindle is of steel ⅞ inch in diameter, and runs in

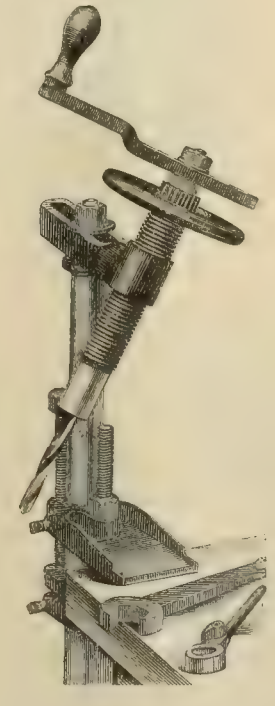

Fig. 2.—Used at an Angle.

composition bushings in each end of the feed screw. It also has a ratchet at the top supplied with a pawl wrench which is substituted for the crank when working in contracted places where there is not room enough to swing the crank. The crank can be adjusted from 3¾ to 8 inches radius. The feed screw nut is fitted with a clasp joint, allowing the drill spindle to be turned to drill at any angle as in Fig. 2; and is threaded to prevent the feed screw nut from being lost out when the clasp is loosened. The clamps are grooved on the inside as shown in Fig. 3, to hold more securely on the edges of I beams or channel bars when drilling structural work. A triangular piece is furnished to use on the taper side of the flange when necessary. A wrench to fit all the nuts and screws is furnished with each machine; all the parts of which are of steel or wrought iron, the total weight of the machine being 29 pounds. The manufacturer claims that the machine is capable of drilling a ⅝ hole 3½ inches deep, at any angle within a radius of 9 inches. The point is made that the advantage of a portable drilling machine that is both light and strong, and

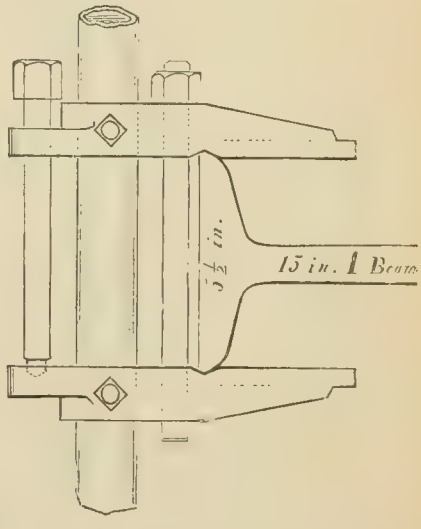

Fig. 3.—Clamped on an I-Beam.

easily applied, is apparent to every one who has had experience in machine building. A No. 2 drill is in course of preparation, of the same size as the machine herewith described, but lower in price and slightly different in construction.

The President of the Argentine Republic has presented to his Congress a very favorable report and forecast of the financial condition of that State. So satisfactory are the finances that it is proposed to largely reduce the duty on tobacco imported from the United States, this source of revenue having been more than counterbalancad in the increased exports of Argentine wheat to Europe. The production of wheat has been very great this year, and during the first six months of 1893 the United States and the Argentine Republic were the largest contributors to the wheat supply of England. Late cable advices from Buenos Ayres speak of serious revolutionary troubles in the Argentine, which may, however, upset all calculations, financial and otherwise, for the coming year.

The oldest engineering society in existence is believed to be the Smeatonian, founded in the last century by Smeaton, one of the pioneer engineers of England. It is still carried on, and was represented in the recent Engineering Congress in Chicago by Sir Benjamin Baker.

ROOFING AND CORNICE.

Corrugated Iron in Australia.

Mention was made in a former number of this journal of the adoption of corrugated iron for school buildings in portions of Australia where the shifting character of the country population made the frequent moving of such buildings necessary, in order to place them as nearly as possible in the centers of the inhabited districts. The *Australasian Ironmonger*, in a recent issue, publishes some further information on this subject, which is of interest. Mentioning the difficulty experienced for many years by the South Australian Government in the proper provision of school-house accommodation for the outlying districts of that colony, the *Ironmonger* says: The farmers here, after working new ground for a few years, move away to unworked ground, generally further north or to the west coast. Under the circumstances it was not policy to erect stone or brick buildings, and the teachers and scholars had to put up with the ordinary wooden buildings, and these were often unpleasantly hot, and, through shrinkage, dust and wind (hot and cold) was admitted. Galvanized iron, payed over on the outside with lime wash, was next tried, the inside lining being of wood. The result was more satisfactory, but still left something to be desired. Owen Smyth, the superintendent of public buildings, next tried the small fluted 28-gauge galvanized iron for internal sheathing in lieu of wood, with ample inlet and exhaust ventilation, and had both sides of the external and internal iron payed over with a special composition of fresh lime, boiling water, sugar and salt. By this means the radiation of heat from the bright galvanized iron was practically stopped, and the result was a neat, clean and healthy building, cool in any but the hottest weather, and even then never ranging above shade heat; while at nights the rooms are beautifully cool (comparatively), besides being fresh and sweet—very different from stone or brick buildings after a bout of hot weather. There is now erected in one of our city State school yards a model iron school room, with ventilation and comfort assured, surpassing in this respect many of the stone or brick buildings. Specially large ventilators carry off the vitiated air through the roof; the fresh air finds access through the ventilators fixed at about 7 feet 6 inches from the ground level; also, if required, from the swing sashes. Owen Smyth has provided a cheap and healty building, with the temperature never more than that of shade heat and frequently much cooler. This building has the advantage that it can always be shifted to another site at a small cost.

A CORRESPONDENT in Chili, writing to a London journal, states that the galvanizing works just established at Valparaiso have been successfully started, and the first galvanized corrugated sheet ever produced in the history of the country was made in the presence of the Mayor and a large company. The proprietors are so satisfied with the prospects of the business, for which they hold the sole concession in Chili, that they have decided to augment the plant, and the works will soon produce 200 tons per week. In addition to this, 12 machines for making gutters, pipes, ridging, &c., are in active employment.

O H One-Piece Conductor Elbows.

We show in the accompanying illustrations views of the plain, round and corrugated O H one-piece conduct elbows, made by the Lawrence-Letts Elbow Company, Limited, Waverly, N. Y. Fig. 1 shows their No. 1 elbow plain, Fig. 2 shows their plain round shoe, Fig. 3 the corrugated elbow, and Fig. 4 the corrugated shoe. They are made of tin plate and galvanized iron. In addition to the styles shown there are also two other elbows of different angles in both plain and corrugated material and which are designated as Nos. 2 and 3 respectively. The manufacturers refer to the round elbows as being made on a true curve and offering the least obstruction to the flow of water, thus rendering them less liable to become obstructed, while the corrugated elbows permit of ample expansion and have no soldered joints to come apart. The further point is made by the manufacturers that there are no flat sides on the corrugated elbows and no corrugations left out for the tinners to shape up by hand in making connections. The galvanized iron elbows are completely formed before galvanizing, which gives them an even coating. They are made from No. 28 gauge and will compare in weight with IX leader pipe.

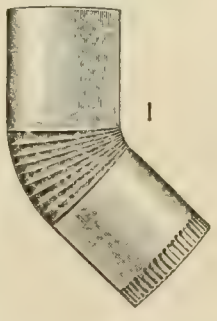

Fig. 1.—No. 1. Plain Elbow.

Fig. 2.—Plain Round Shoe.

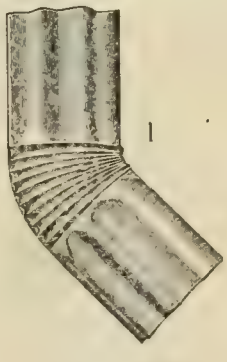

Fig. 3.—No. 1 Corrugated Elbow.

Fig. 4.—Corrugated Shoe.

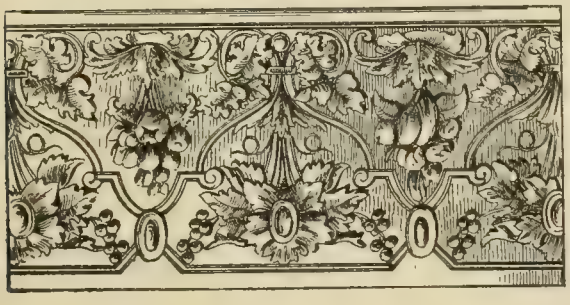
THE O H ONE-PIECE CONDUCTOR ELBOWS.

THE CINCINNATI CORRUGATING COMPANY, Piqua, Ohio, issue a new illustrated catalogue of their products. The volume, bound in scarlet paper, opens with general views of the company's plant, which comprises a rolling mill, galvanizing works and tin-plate works. The goods made by this concern include the following corrugated products: Roofing, siding, ceiling, arches, lath, shutters and doors; also V-crimped iron roofing, standing seam plain roofing, roll and cap steel roofing, metallic weather boards, ridge capping and beaded metallic ceiling. They also make roofing plates and galvanized sheets known under the brand of Piqua. The firm are prepared to furnish estimates on metallic material for buildings, including cornices, gutters, conductor pipe, &c. In an introductory note to the trade they tell their reasons for moving to Piqua and the advantages that they there possess. The catalogue gives illustrations with descriptive particulars of the various products that have been referred to, and the whole is put up in a compact and convenient shape, and will be of interest to those handling sheet metals. Accompanying the catalogue is a little pamphlet issued by the same concern, entitled, "The Life of an Iron Roof," consisting of a

series of letters from those who have used this material, showing how it has endured for many years, some of them giving records of over 50 years.

New Designs in Sheet-Metal Work.

We show in the accompanying cuts illustrations of embossed metal work made by the Kn x & Stonier Architectural Sheet Metal Ornament Company, Toulon, Ill. The designs reproduced in the illustrations are new, having been on the market but a comparatively short time, and are stamped in zinc, copper or sheet steel. The zinc and copper are used on cornices and for



New Designs in Sheet-Metal Work.

similar work, while the sheet steel is intended for ceilings and other interior work.

FLASHINGS.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until October 17, for the labor and materials required for the cut stone work, iron work, wood floor, ceiling, roof construction and roof covering for the United States Custom House and Post Office building at St. Albans, Vt., in accordance with drawings and specification, copies of which may be had at the office of the Supervising Architect, Washington, or from the Superintendent at St. Albans, Vt.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until October 18, for the labor and materials required for the trench excavation, foundations, stone and brick masonry, cut stone work, wood floor, ceiling and roof construction, roof covering and approaches for the United States Post Office building at Rockford, Ill., in accordance with the drawings and specification, which may be obtained from the Supervising Architect at Washington or from the Superintendent at Rockford.

THE IMPETUS given to the sheet-rolling industries of Eastern Ohio during the past two weeks continues, but its force is not increased. The sheet mills at Niles, Canal Dover, New Philadelphia and Cambridge are in operation, but the order files do not present a bulky appearance. If it were not for a fair demand for galvanized sheets matters would be dull in the territory named. Iron and steel roofers are doing some business and in this line it is reported that the demand for galvanized stock shows a marked increase. Several concerns have curtailed their expenses by calling in traveling men, and do not expect to send them out again this season.

English journals announce a new social experiment which is about to be made by a band of Australian colonists in South America. Two hundred persons have left Sydney for Paraguay, and some 800 are to follow. They have an initial income of some $300,000, and propose founding an ideal farming and industrial community. There is to be no distinction of sex in the colony; every member is to have an equal share in the general property and equal voting power, while the only form of government will be a director, elected by two-thirds majority, aided by a kind of advisory board chosen in the same way. Why they have come all the way to Paraguay when there is so much unoccupied land still available in their own continent is not stated.

Prize Competitions.

IN CONNECTION with the movement among Hardware retailers with a view to forming an organization for the protection of their interests Competitions Nos. 26 and 27 are of special interest. Competition No. 26 relates to the question as to the extent to which manufacturers and jobbers are justified in selling to consumers, and the papers we have received look at the matter from the different standpoints of the parties in interest. The committee to whom the papers were referred have awarded the prizes as follows:

First Prize to A. D. BANKER.
Second Prize to J. E. JANSSEN.
Third Prize to E. G. LUFKIN.

Prize Competition No. 27 is in regard to local organizations of Hardware merchants, and the opportunity thus given for an understanding or an association among the retail merchants in a town or city with a view to the protection of their interests. The scope of such associations, their difficulties and advantages, are considered, and the subject as a whole has been covered in an able and interesting manner. The committee to whom the competitions were referred have awarded the prizes as follows:

First Prize to A. H. HOPE.
Second Prize to F. H. WOODWORTH.
Third Prize to J. ROBERT RAINEY.

After several years' experiments the Lighthouse Board has been successful in establishing electric communication with lightships and lighthouses placed at a distance of more than a mile from the shore. The difficulties which have hitherto prevented connecting by electric cable a vessel swinging at anchor at sea with the land are said to have been overcome by attaching the core of the cable to the anchor chain and making a conductor of the latter. The leakage of electricity produced by the water has also been reduced to a minimum. Telephonic communication has been established with some off-shore light vessels, and it is intended that all shall be similarly connected with the shore. This will prove the means of a great saving to the shipping interests of this country, as life-saving stations will be quickly and easily communicated with in cases of emergency.

Nearly 4,000,000 rupees are to be expended in India immediately on new railroads, and it is intended to link all the lines so as to form, as far as they go, a complete network of railways. Indian railways are under the control of the Imperial Government.

Quite a large number of orders for vessels were placed with the Clyde shipbuilding firms during the month of August, causing an appreciable improvement in the condition of that industry and allied trades in Scotland, after a prolonged spell of dullness.

TIN PLATES.

The Tin-Plate Report.

From JAMES B. SCOTT & Co., *Pittsburgh, Pa.*—We would rather enjoy your comments in *The Metal Worker* of 16th inst. respecting the information given out by the Bureau of Statistics were not the evident twisting of reports too serious to be laughed at. Possibly all American manufacturers may take earnest exception to this report. We speak for our own interests, as embraced in our own factory in this city and the plant of the Blairsville Rolling Mill & Tin Plate Company, at Blairsville, Pa., the entire output of which we market. We know of no theory from which it is proper to speculate upon annual output upon the basis given in this report. At Blairsville was erected an entirely new plant, consisting of hot and cold rolling mills, heating and annealing furnaces and pickling machines, together with a complete tinning house. This plant only began practical operation in the quarter ending March 31, 1893, and to make an estimate of its annual capacity (as attempted in this report) upon the basis of three and one-half times the actual output of the quarter, most of which was passed before the actual completion of this plant, is evidently improper. As the Bureau of Statistics had in hand long since the actual returns from the quarter ending June 30, it may be pertinent to inquire why same are not published. We may state that in a single month of the quarter ending June 30, we delivered from Blairsville to consumers a quantity of finished plates in excess of this Bureau of Statistics' estimate of the annual output of this mill. Every sheet coated at Blairsville is rolled in the mill there, the out put being the product of a complete American plant. Within a few days the additional mill erected at the Blairsville plant has been put in operation, thus giving at the present time a daily output of 300 boxes.

From MERCHANT & Co., *Philadelphia, Pa.*—We notice in *The Metal Worker* a report of the domestic manufacture of tin and terne plates. We are pleased to note that in publishing it you take the opportunity to state that it is more or less inaccurate. As far as our firm is concerned the statements are inaccurate—indeed, are ridiculously so. For instance, our capital invested is put down as $2000. As this represents just one-fifteenth of the cost of the real estate on which our works are erected, to say nothing of buildings, machinery, &c., it is needless for us to comment further on the value of such reports to the public.

A SAMPLE of tin from the new Mount Wills South Mine in Victoria, Australia, was recently sent to Melbourne to be practically tested in use, with the result that after being tested in several different ways—making solder, tinning and also for the manufacture of white metal—it was found to be of excellent grade.

The British Tin-Plate Trade.

The tin-plate trade in England just now seems to have reached a depth of dullness almost unexampled. Although the coal difficulty in Wales, caused by the miners' strike, is practically adjusted, tin-plate manufacturers seem unwilling to resume operations under existing conditions. It is stated that they find it almost impossible to produce plates that will cover their cost under the ruling prices, and they cannot get better prices, notwithstanding that production has been so much curtailed. This is accounted for partly by the fact that the American demand has fallen off so largely on account of the possibility of changes in the tariff, which makes importers chary of laying in any large stocks, that stocks in England are larger than usual. The situation in South Wales was thus stated by the Swansea correspondent of the London *Iron and Coal Trades Journal* on September 9: The Swansea district has yet scarcely begun to recover from the strike. A few days ago it was reported that there were 18 tin-plate works idle in South Wales and Monmouthshire, namely: Abercarne, 7 mills; Aberdare, 3; Abertillery, 9; Blaina, 10; Clydach, 3; Dynevor, 6; Foxhole, 4; Garnant, 3; Llangennech, 6; Llwydarth, 4; Melyn, 7; Nantyglo, 7; Pontymister, 10; Panteg, 6; Penclawdd, 4; Pontardawe, 10; Tirydail, 3; Ystitty, 4. These contain 106 mills and give employment to nearly 4000 people. The majority of the works have had to cease operations owing to the scarcity of coal; at others there are disputes unfortunately pending. At the Pontardawe works nearly one-third of the mills have since restarted, and at some others preparations are being made to resume operations, but some time must elapse before all are at work again. Though large quantities of coal are beginning to come down from the pits, most of it is required for shipment under contract. There is very little available at present for the market, and what little there is commands such high prices that, as a rule, tin-plate makers do not care to restart their works until they are able to buy at something like the old figures. A month's notice to terminate contracts was posted at the Vernon Tin Works, Briton Ferry, on Monday last, and at the works of Messrs Morewood & Co. the men are on the day-to-day system.

At present the shipment of tin plates about keeps pace with the production. Last week the shipments amounted to 53,525 boxes, while the number of boxes received from works was 58,910. Stocks are very heavy just now, amounting to 261,384 boxes, as compared with 144,181 boxes at the corresponding date of last year. Prices remain about the same as last week, the restriction of make caused by the stoppage of mills having had no stimulating effect on prices.

The Glamorganshire and Monmouthshire tin plate works are also stated to be for the most part idle, and some 6000 or 7000 work people have been wholly or in part thrown out of employment in the tin-plate districts.

The Tin Mines of Perak.

The Malay Peninsula, as is well known to our readers, contains some of the richest and most extensive tin mines that have yet been discovered. At present some two-thirds of the world's supply of the metal comes from that country and its adjacent islands. The former is known to commerce as "Straits" tin, from being shipped at certain ports on the Straits of Malacca, known as the "Straits Settlements." Certain portions of the Peninsula are naturally more productive of tin than others, and Perak stands at the head in this respect. An account of the tin-mining industry as carried on in that State will therefore be of interest. The *Engineer* of London recently published a full description of the Perak mines and the methods there employed, from which we extract the following details, which will serve to amplify former information given in these columns regarding the two mines of the Malay Peninsula.

MALAYAN TIN DISTRICTS.

The stanniferous area in those regions is estimated to have an extreme length of 1200 miles, and few portions of Malaya are destitute of indications that the metal exists beneath the surface. Singularly enough, the whole product as yet met with consists of alluvial ore, known as "stream tin," and is obtained by simply washing the soil after the superincumbent layer of clay or gravel has been removed. McCullough, in his "Dictionary of Commerce," makes the somewhat misleading remark that "no attempt has hitherto been made at regular mining or obtaining the ore from its rocky matrix;" misleading because as yet such matrices remain undiscovered, although natives occasionally aver that they have seen large lumps thus procured. As the local governments have offered a fair reward for any information as to the existence of reefs, it seems hardly probable that the Malays, who prefer to make money in any way rather than by hard work, would have neglected such a chance. Practically speaking, at all events, the tin of the country is derived exclusively from tin sand.

THE KINTA DISTRICT AND RAILROAD.

Perak, a semi-independent State, ruled by a native Rajah, under the protection of the British Government, is situated about half way down the Malay Peninsula on the Straits of Malacca. The richest tin district of the State lies a little to the eastward of the right branch of the Perak, or Kinta, River, and is known as the Kinta district. This district has been lately brought into prominence through a line of railroad, the first yet constructed in this portion of the far East, having been opened in it. The line has been built under British auspices, and it is expected to revolutionize the carrying trade of the country, and especially to promote the tin-mining industry, which

is its chief resource. At present the line only extends from the port of Teluk Anson, across the River Bidor to a place called Tapah, but it will ultimately be extended through the entire tin district.

CHINESE MINERS.

The great industry which the new railway is chiefly designed to serve is carried on in a similar way throughout the country, so that a description of the methods pursued in Perak applies to Malayan mining generally. It must not, however, be supposed that the Malays are the miners of the place. A few "ancestral mines," namely, mines which have been worked by their fathers and forbears, are indeed in Malayan hands. But the great majority of the working class in the Peninsula—as, indeed, everywhere else, if they can get a footing—are Chinese. Untiring in his toil, sober, to be relied on if well treated, and willing to work for wages on which any one else would starve, while his chief vices—gambling and opium smoking—are only indulged in when the day's toil is completed, Ah-sin and his friends are the pioneers of the Eastern world. It is usually agreed that the miners shall receive a share of the profits made by each mine, the small sums paid them meanwhile being treated as advances from the amount finally due.

PRIMITIVE METHODS OF WORKING.

Let us see how the Chinaman sets about opening a mine. It seldom happens that the would-be tin digger is a man of means. He therefore goes to some richer friend who agrees to advance the necessary money upon condition that the metal obtained is sold to him exclusively, and that all the tools, food, opium, and anything else required is bought from him. We assume that the digger has obtained a yearly license, but if not, he can for a small fee get the ground he proposes to work surveyed and staked out, and upon payment of $1 be entitled to work it for 12 calendar months. These preliminaries settled, the next question is plant. It is very simple. Firstly, a number of changkols, or native hoes, must be obtained, according to the number of men it is proposed to employ. This serviceable tool becomes in Eastern hands the equivalent of spade, hoe, and rake—to say nothing of its uses as a weapon of offense. The next articles to be got are a sufficient number of bakols and ragas, or baskets. The ordinary earth carrying basket is known by the former name, but the three varieties used only in mines by the latter. They are spoon shaped, with two handles, and are made of an open-worked sort of wicker, so as to act as a sieve when lifting stones or dirt out of the mine. When the tin-bearing stratum is actually reached a sort of wooden spade is used in place of the chankol to work up the sand. The next necessity is to provide wooden planking to build the waterways, as without water no mine is workable. The stream thus obtained turns a rudely-made undershot water wheel 4 to 5 feet in diameter, and about the same in width. A sprocket wheel on the axle serves to work the well-known Chinese pump, familiar to all who have visited exhibitions or museums. It resembles our old man-of-war chain pump, but the pistons are square instead of round. When used at an angle these work in a three sided trough, passing over another sprocket wheel placed at its foot. For more perpendicular work the trough is closed, and thus becomes a four-sided pipe. The trough passes through a water-tight box in the wheel sluice, into which it empties its contents, and as it is always at work it effects the end in view well enough.

From 10 feet to 12 feet of "overburden" is the average that has to be removed before the karang or tin-bearing drift is reached, and water usually appears at about this depth. Assuming the vein to be satisfactory, and the pit kept well drained, the coolies load their ragas with the tin sand, gravel and soil of which the drift consists, and convey it up planks to the edge of the pit. The baskets are either carried singly or from a bamboo yoke in pairs, and the drift is then thrown into the head race. The sluice box is frequently made of a tree split lengthwise and hollowed out. Small dams are placed at intervals in the race to retain the rich dirt, which is again and again rewashed until only the biji or "tin seed" remains.

SMELTING.

To smelt the biji two forms of furnace are employed. One in use by the Malays is supplied with a blast from two upright cylinders. It is conical in shape and is built of clay. The Chinese smelting furnace differs from it slightly in shape, and being supported on three legs, is vulgarly known as the *Sam Kak Miao*, or "three-legged cat." It derives its blast from a square wooden box, in which slides a feather piston, usually worked by a boy squatted on the ground. It is not, however, invariably placed in this position. The melted metal pours from the furnace direct into the mold, not more than one slab or shoe of tin, as a rule, being cast at the same time. The slabs are piled in a hut until a sufficient number have accumulated to freight a good-sized boat, when they are dispatched to headquarters.

PROSPECTS FOR WESTERN INVESTORS.

Such is briefly the condition of native tin mining. Expenses have, of course, to be incurred in building attap huts for the coolies and staff, and in obtaining sufficient provisions. Riots often occur if the commissariat is not well looked after, as also on the six-monthly or annual settling days, should the coolies imagine they have been cheated of their just rights. In the main, however, the work is peacefully carried on, and many who began as day laborers have become rich men. Europeans have gone to this district, and have sent out quantities of costly machinery for the tin mining, dressing and smelting. They have, however, failed, chiefly because that which will pay on the very economical system of working adopted as described will not pay under European systems with a numerous and expensive staff and costly machinery. The pay to native laborers is exceedingly small, and it will only be by a very careful study of the whole of the conditions and circumstances on the spot that really profitable working will be possible to Europeans by Western methods, even now that transport will be improved.

Tin-Plate Production.

The daily press publish the following dispatch from Washington under date of September 28, but it is not made clear in the report whether the figures given apply only to American plates, for it will be noticed that the output of tin plates exceeds the production of black plates by 50 per cent. The dispatch is as follows:

Special Agent Ayer, from the sworn statement of manufacturers, has submitted a report to Secretary Carlisle, showing the production of black steel and iron plates and of tin and terne plates for the fiscal year ended June 30, 1893. The total of the former aggregated 63,581,541 pounds, and of the latter 99 819,202 pounds. The amount of American sheet iron and steel made into articles and wares, tinned or terned plates during the past fiscal year was 8,802,681 pounds. The quantity of tin and terne plate imported and entered for immediate consumption during the fiscal year aggregated 611,949,980 pounds. The quantity of the above plate on which duties were paid and which was used in the manufacture of articles exported with benefit of drawback was 128,863,227 pounds. The total consumption of tin and terne plate for the fiscal year was 720,000,000 pounds, of which 15 per cent. was of American manufacture.

Figures are given to show that "the product from American plates was about five-eighths of the amount necessary to enable manufacturers to meet the one-third requirement under the law, which provides that during any one year of the term of five years the domestic production of tin plate must equal one third the importations during any one of such years, otherwise the duty on tin plate will be abolished."

A Handy Man.

Many imitations have been given to the public of the famous advertisement of a "handy man," but the following is the original as published in a paper at Aylesham, Norfolk, in 1680: "By His Majesty's letters patent. Beards taken off and registered by Isaac Punchard Barber Perrewig maker Surgeon Parish Clerk Schoolmaster Blacksmith. I shaves for a penne cuts hare for twopence and oyld and powdired in the bargane, young Ladies genteely educated, lamps lighted by the year or quarter, young gentlemen also taut their grammar language in the neatest manner, and great keer takin of their morrels and spellin. Also salm singing or Horce shewing by the reel makir, likewise maks and Mends all sorts of butes and shews, teaches the Ho boy and Jews harp, cuts corns, bleades and blisteres on the lowest terms. Cowtillions and other danes taut at home and abrode, also deals holesale and retail in Perfumery in all its branches, sells all sorts of stationery ware, together with blackin ball, Red herrins, Gingerbread, Coles, Scrubbin brushes, treycle mousetraps, and all other sweetmeats, Likewise Godfathers cordial, red rutes, Tatoes, Sausages, Black Puddins and other Garden stuffs. P.S. I teaches Goggrify and all them outlanguaged kind of things. A bawl on Wensday and Friday. All performed God Willon by me Isaac Punchard. To be had at my warehouse were you may be served with the very best Bacco, by the ounce ream quire or Single Sheet. N.B. Also Likewise beware of Counterfeits for such is abrode."

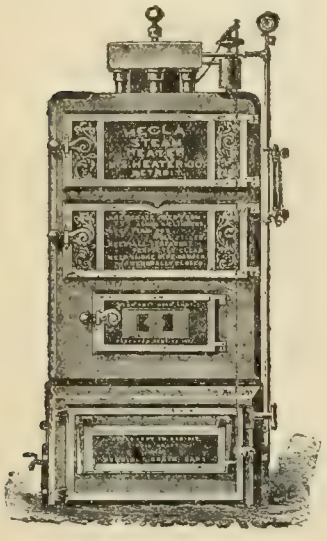
The much vexed question of the location of the new United States mint in Philadelphia is at last set at rest by the decision of Secretary Carlisle on a site at Broad and Cherry streets in that city.

The New York and New Jersey Bridge bill was favorably reported to the House of Representatives last week from the Committee on Commerce.

STEAM AND HOT WATER.

The Hecla Steam Heater.

The accompanying illustrations show a general view and also a view of one of the sections of the Hecla steam heater, which is being put on the market by the United States Heater Com-



The Hecla Steam Heater.—Fig. 1.—General View of Heater.

pany, Detroit, Mich., and to which reference was made in a recent issue of *The Metal Worker*. Referring to Fig. 2, which is an outline of the Hecla water section, it will be seen that the middle horizontal waterway is similar

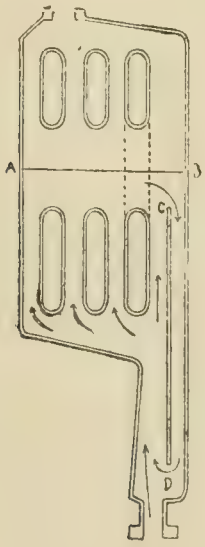


Fig. 2.—Outline View of Boiler Section.

to the one used in the Capitol heater, but increased in depth, thus giving increased steam and water space and making ample allowance for the fluctuation of the water line shown at A B. The upper part of the section becomes a steam chamber through which the hot gases circulate. Another important modification over the Capitol section is the enlargement of the water leg and of the outermost water tube, of which it is a continuation This further increases the water and steam space and permits the introduction of a diaphragm, C D, which provides for the circulation of the water in each section. A feature to which attention is directed by the manufacturers is the slightly funnel-shaped form given to the vertical water tubes. Their inclined walls, it is pointed out, permit every globule of steam as soon as it is formed to rise unimpeded, so that there is a continued and constant movement of steam upward from the heating surface to the steam chamber and a consequent steadiness of the water line. The Hecla is made with both single and double fire pot, the former in five sizes with grate surface from 22 x 21 to 22 x 37 inches and adapted to heat from 450 to 850 square feet of radiation. The double fire pot heaters, made in four sizes, are adapted to heat from 1100 to 1700 square feet of radiation.

Heat Controller Attachment.

The accompanying illustration shows a new device put on the market by Hodge Brothers, 15 Chardon street,

Heat Controller Attachment for Furnaces.

Boston, Mass, and which is to be used on Hodge's Eureka air valves, which were explained in a recent issue of the paper. This device is called their Heat Controller Attachment, and can be applied to any of their Eureka air valves in place of the cap. With this attachment any part of the radiator or coil can be heated at will, and the rest of the radiator kept cool, adapting it for use in mild weather when but little heat is required.

HEATING NOTES.

FERDINAND JAKEL, Detroit, Mich., is the patentee of an improved form of water heater. The heater is composed of rectangular cast sections, provided with a series of horizontal alternating tubes extending from the opposite vertical faces of the sections. The tubes are slightly conical and present an extended surface to the heat.

THE ROOF WORK on the new plant of the Buffalo Heating & Ventilating Company, at Homewood Park, Depew, N. Y., is almost completed. The company have begun drilling wells for a water supply, and will probably drill for gas wells in a few weeks. An effort will be made to obtain gas enough to run the plant and heat the homes of the workmen.

AMERICAN RADIATORS are to be used in Medina Temple, Chicago, and Orington Lunt Library Building, Northwestern University.

THE NASON MFG. COMPANY, 71 Beekman street, New York, are busy shipping their popular Equator for steam and Gulf Stream for hot-water boilers and their equipments.

AT RICHMOND, VA., the Smith-Courtney Company use the Gorton boilers made by the Gorton & Lidgerwood Company of New York in all their heating contracts.

Electric Motors for Small Power Requirements.

An increasing use of electric motors by tradesmen and others requiring small power is noticeable in the British metropolis during the past year or two. The *English Mechanic*, in relation to this circumstance, says: The advantages of the electric current for use in small motors are beginning to be appreciated in the St. Pancras district, where it is supplied during the daytime at a cheap rate. Power is useful to even small manufacturers, and many of them rent shops in which steam power is supplied at so much per week or month; but many do not want the power all the time the shafting is running, and those who could find the capital put in small gas engines, which they are loth to discard now, even though they can get the electric current for 3 pence a unit. New shops, however, will use it, as it is switched off and on with the least amount of trouble, and the payment is only for the current used. Brass workers, makers of "small goods" for the organ and piano trades, and other manufacturers who cannot put down expensive plant are beginning to find the electro-motors very useful and handy devices.

The most important move in iron and steel trade circles during the past week was the action taken by the Finishers' Association, at their meeting held in Youngstown, Saturday, September 23. It was decided to accept the 10 per cent. reduction in wages asked for by the manufacturers several weeks ago, but refused by the workmen at that time. It is now probable that a conference will soon be held and an agreement reached. The disposition of the finishers and the Amalgamated Association to adjust their differences will, no doubt, be a means to this end, but a settlement of the wages question is not considered certain, as the continued depression in prices has caused the manufacturers to demand a still further reduction than 10 per cent. If a settlement is made and operations commenced, fully 6000 men will be directly or indirectly concerned in the Mahoning Valley.

The Porter Adjuster for Electric Lights.

The Porter adjuster can be easily and quickly attached without detaching the cord from the lamp socket or rosette. Fig. 1 shows the adjuster attached in position on the cord with a part of the brass shell broken away showing the wood spindle with the cord slot through which it passes with the cord in position, one flange on the wood spindle being partly broken away to show a portion of the regulating spring. Fig. 2 shows

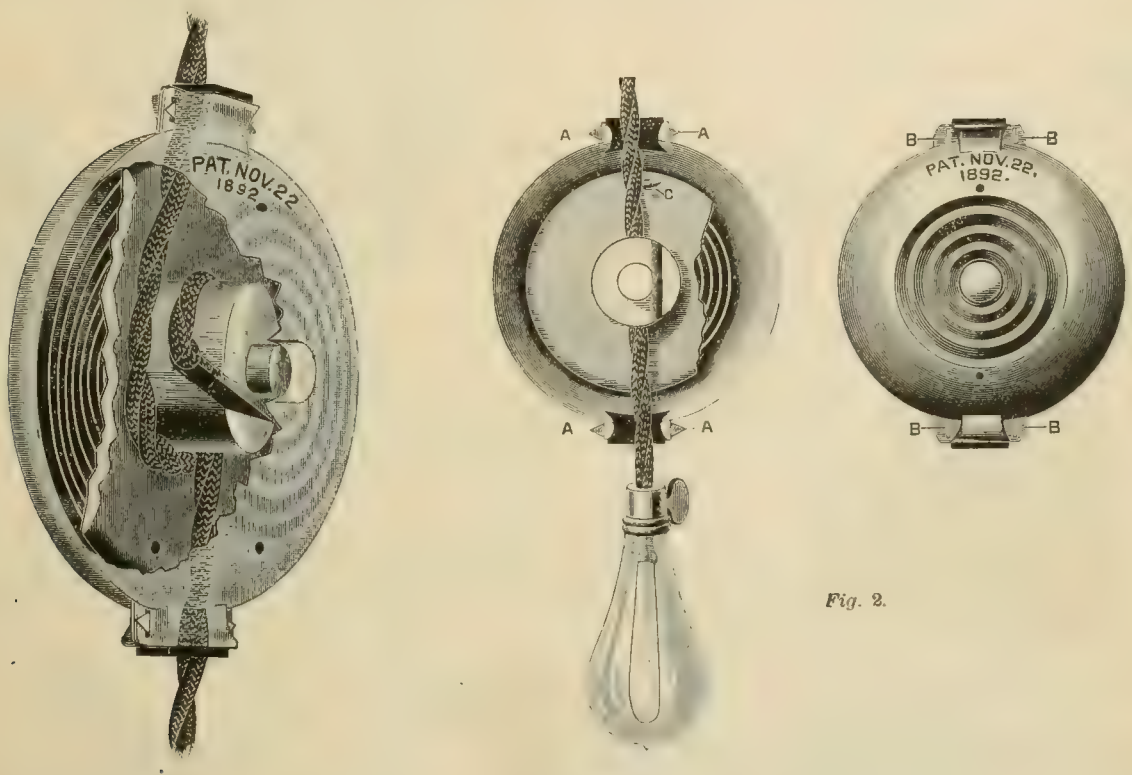

Fig. 1. Fig. 2.

THE PORTER ADJUSTER FOR ELECTRIC LIGHTS.

the adjuster with one-half of the brass shell removed, each of the shells being made of brass and stamped up to proper shape, one of the halves has four slots marked B and the other has four V-shaped points marked A, the wood spindle is secured to the latter so it cannot be displaced while being attached to the cord. To place the adjuster in position the cord is pressed to the back of the slot in the wood spindle; then the shell with B slots is placed so that the four points A extend through the slots. When these points are bent down they hold the halves together firmly. The pin C is then removed and the adjuster is ready for use. The spring is regulated to the desired tension before attaching. To move the adjuster up or down on the card after being attached it is simply necessary to pull the lamp way down and move the adjuster to the proper position, the card slipping through the slot in the spindle without injury. This device is made by Stephen Porter & Co. of 384 Atlantic avenue, Boston.

Great surprise is expressed in the naval service at the report that the boilers of the cruiser Chicago, now absent on the European station, are in so bad a condition as to require her immediate return for repairs. This vessel has been only seven years afloat, during which time her machinery has not been subjected to any hard usage, therefore it is thought that the defects must be due either to inherent weakness or careless use, either of which reason would demand strict investigation in the interest of the efficiency of the naval service.

Galvanized Sheets in Foreign Countries.

In view of the increasing demand for galvanized sheets abroad, the following table, given in the British Board of Trade returns for the month of August, and stating the amount and value of galvanized iron and steel sheets exported from Great Britain to various countries during the first eight months of this year, and in the eight months ending August 31, 1892, will be of interest as showing where this material is in the greatest demand. It will be noticed that while the volume of sheets exported has increased by 7500 tons, the value fell off £14,600.

Galvanized Sheets.	Quantities.		Values.	
	1892.	1893.	1892.	1893.

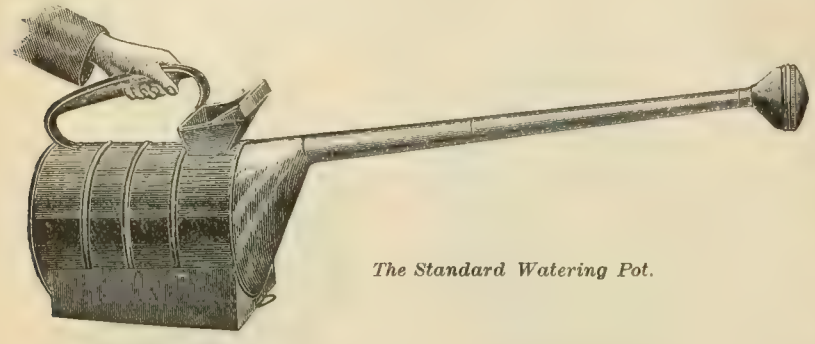
As the result of comparative trials of the Baker and the Holland submarine boats the Board of Naval Experts has forwarded a report to the Navy Department setting forth its recommendations in favor of the Holland boat. The report recommends that the Holland company be instructed to have their proposed boat built at some responsible shipyard, and that they be awarded the contract at their price of $135,000. Of the $200.000 appropriated by Congress $150,000 was intended for the boat and $50,000 for experiment. The Holland boat, it is expected, will be able to descend to a depth of about 60 feet and make about 10 knots under water.

THE RETAIL STORE.

The Standard Watering Pot.

The accompanying illustration shows the Standard watering pot, manufactured by George H. Engelhart, Glenville, Ohio, which is especially intended for the use of farmers, gardeners, greenhouse and nursery men. This pot, for which a patent has been applied, is made with a square false bottom so that it will not tip over on being filled, and is provided with a long and substantial handle and a long detachable spout. The sprinkler on the end of the spout is arranged so as to throw water either upward or downward, as may be desired. It is pointed out that the handle being on top of the can balances it when filled or unfilled, and makes it easy to handle. The opening of the can is so arranged that the water will not splash over or out while carrying it, or when in use. The cans are made in five sizes, of 8, 10, 12, 14 and 16 quarts, and are made of IX tin, painted inside and outside.



The Standard Watering Pot.

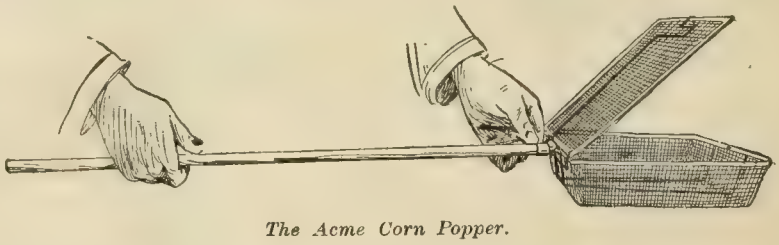
Engraved Acme Nut Cracker.

The novel feature of this article, as illustrated in the accompanying cut, is the engraving, a plain pattern of the cracker having been put upon the market some time since by the manufacturers, the Acme Shear Company, Bridgeport, Conn. The cracker is 6 inches over all and consists of an upper handle and jaw in one piece with a short jaw worked by the lower handle. A steel coil spring is inclosed at the top of the short jaw, which automatically opens this to receive a fresh nut as soon as the pressure on the handles is released. It is remarked that the construction is very simple and that the jaws are so constructed as to admit of cracking nuts of most kinds, from the largest to the smallest. Each cracker is placed in an anti-rust paper pocket, half a dozen being packed in a neat box. The cracker shown in the cut is full nickel plated. The goods are also furnished perfectly plain, highly polished and nickel plated, also plain black japanned.

Engraved Acme Nut Cracker.

The Acme Corn Popper.

Gilbert & Bennett Mfg. Company, 42-44 Cliff street, New York, with factory at Georgetown, Conn., are introducing the Acme corn popper, as shown herewith. The feature of the popper is the heavy wire lever by which the lid is controlled. When the lid is to be raised, as shown in the cut, all that is necessary is a slight pressure upon the lever near the handle. The wire is so bent at the front end of the popper that when the lid is closed it may be securely fastened to the basket by the hooked part of the lever simply by drawing the wire back. This allows the lid to be opened or to be closed and locked without danger of burning the hand, and prevents the lid from closing when emptying out the popped corn. The poppers are made in 1, 1½ and 2 quart sizes.



The Acme Corn Popper.

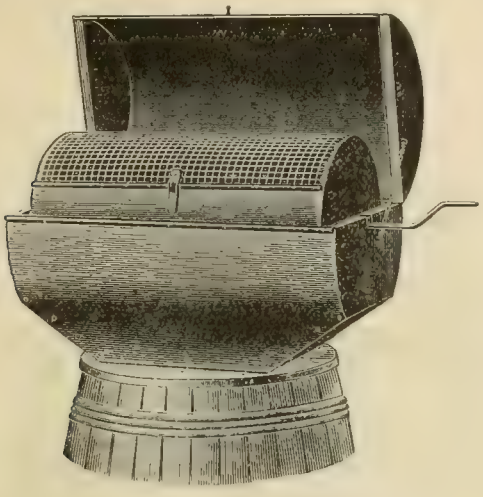
Rambler Alcohol Stove.

The accompanying illustrations show the Rambler alcohol stove, being introduced by Geo. L. Thompson Mfg. Company, 6126-6130 La Salle street, Chicago. It consists of a handsomely nickel-plated case, stamped from one piece of metal, 4 inches long and 1¾ inches in diameter. This has a beaded cover which fastens over lugs on the case, holding it securely in place. The case contains the stove, stand and bottle for alcohol; the stand opening to a diameter of 2½ inches. A spoonful of alcohol fills the stove, which, it is stated, will burn for ten minutes with steady, intense heat, which is ample for the purposes intended. The point is made that the bottle of alcohol is always at hand when needed, and cannot be spilled while in the case. The case may be carried in the pocket or satchel when traveling, the stove being designed for heating curling irons or liquids.

Rambler Alcohol Stove.

Dustless Barrel Ash Sifter.

Held & Gruenhagen, St. Anthony Park, Minn., are introducing the dustless barrel ash sifter, herewith shown. The material of which the sifter is made is principally cast and sheet iron.

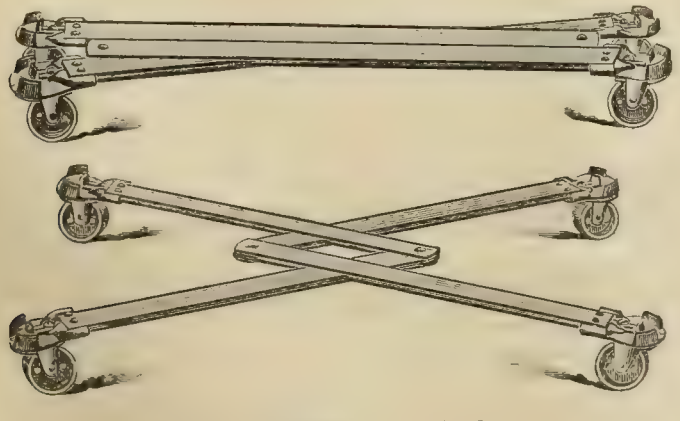


Dustless Barrel Ash Sifter.

The inside roll is made of galvanized iron netting, with ¼-inch mesh. The manufacturers claim that the sifter is practically dust proof, and may be used in a basement or back shed without making any dust or dirt; also that the revolving principle makes the sifter easy for any person, even a little child, to operate. The sifter is made in two sizes: No. 1, with inside roll 12 inches long by 12 inches in diameter; No. 2, inside roll 24 inches long by 12 inches in diameter. The bottom casting of both sizes will fit any common-sized barrel.

Steel Lock-Frame Stove Truck.

Some time since we called attention in these columns to an improved stove truck which was being manufactured by Randall & Ward of Le Roy, N. Y., and for which many claims were made. The makers have now brought out another truck, in which the four arms are wholly of steel, instead of wood and metal, as employed in the old device. The steel lock-frame stove truck, as it is called, and which is shown in the accompanying illustration, carries the stove 2½ inches from the floor, while easily handle any stove. The caster employed is a special one made for the truck and having a particularly deep foot plate. The four double arms are so crossed and bolted together that they become self supporting, and in order to adjust the truck to any stove it is only necessary to pull them apart or push them together, according to the requirements of the case. The steel is nicely japanned, and riveted to the manufacturers' special anti-friction caster with coppered foot plate. The stove truck is fully warranted, and will be offered to the trade as the "cheapest steel truck on the market." The engraving here presented shows the truck extended ready for use, and also indicates its appearance when closed for storing or shipment.



Steel Lock-Frame Stove Truck.

holding it secure without the use of clamps, yokes, bolts or other unnecessary contrivances. The makers state the arrangement is such that one man can

Hammer Handle Tack Package.

The Grand Crossing Tack Company, Grand Crossing, Chicago, Ill., are offering the above article as illustrated herewith. The cut represents the package one quarter its size, the handle being filled with steel carpet tacks. These are packed half a gross in a sandpapered box with hinged cover, in assortments of 6, 8, 10 and 12 ounce tacks. The manufacturers remark that the consumer pays 5 cents for a nickel's worth of tacks and gets a hammer for nothing.

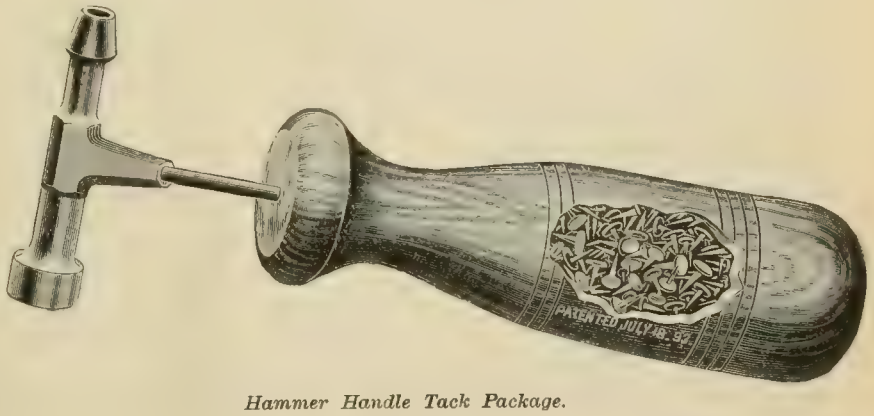
MEMORANDA.

HALL BROTHERS of Ballston Spa, N. Y, were awarded first premium for their exhibit of stoves and hardware at the Saratoga County Fair.

NEWTON & HILL AND C. W. BOUTELLE of Fort Edward, N. Y., made splendid stove exhibits at the Washington County Fair, recently held at Sandy Hill, N. Y.

THE HARDWARE, STOVE AND TINWARE STOCK of Rensch & Coffey, Madison, S. Dak., has been purchased by McDonald Brothers. The retiring firm had a fine business at the time the sale was made, and McDonald Brothers have good prospects of success in their new venture.

A German mechanic has, it is announced, discovered a process for producing, through the combination of rawhide and a composition of his own, a new material adapted to the manufacture of cog and friction wheels, which is likely to supersede iron and other metals in certain cases. It is claimed that this new material not only insures the noiseless working of machinery, but also that teeth made from it are more durable than those of metal.



Hammer Handle Tack Package.

The *American Druggist* reminds us that we are indebted to the ancient Romans for the great canning industry. Years ago, when the excavations in Pompeii were just beginning, a party of Cincinnatians found in what had been the pantry of the house many jars of preserved figs. One was opened, and they were found to be fresh and good. Investigation showed that the figs had been put into jars in a heated state, an aperture left for the steam to escape, and then sealed with wax. The hint was taken, and the next year fruit canning was introduced into the United States, the process being identical with that in vogue at Pompeii 20 centuries ago.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

A. C. JONES, Paris, Maine, has completed the erection of a steam heating plant in the new residence of L. S. Billings.

THE FRANKLIN COUNTY, PA., ALMS HOUSE is to have a new steam heating plant, the Commissioners having awarded the contract to the Harrisburg Steam Heat & Power Company, Harrisburg, Pa., at a reported price of $5800.

A COMMITTEE OF SIX from the School Commissioners of Syracuse have been visiting the schools of Boston, Lowell and Worcester, Mass., to gather information of heating systems to guide them in selecting the proper one for the new Townsend School. The selection will be made at an early date.

THE VANDERMAN PLUMBING & HEATING COMPANY, Willimantic, Conn., have received the large horizontal tubular steam boiler to be used in heating the new Murray Block, and are now engaged in the work of setting it.

HENRY W. COVELLE has secured the contract for plumbing the new apartment house built by J. D. Whiting, at Somerville, Mass.

BROWN & MORROW, Brockton, Mass., have recently installed a hot water heating plant in the Convent of the Sisters of Charity and have the contract for plumbing the new Whipple-Freeman Block. They have just completed plumbing a new boarding house connected with the Howard Seminary, and are now overhauling the plumbing in the seminary building.

COE & MCMILLAN, Monticello, Ill., have secured the contract for placing the plumbing in the Piatt County Court House, at Monticello, consisting of five water closets and four urinal stalls of slate, at a cost of $1400. They have also just closed the contract for putting in a Perfect hot-water heater for Harry Knight of Monticello, using the Detroit ornamental radiators, the price being $325. In addition to the work on hand they are making estimates on several jobs outside the city for plumbing and heating.

SAMUEL I. POPE & Co., 360 and 364 Dearborn street, Chicago, have the contracts for steam heating in the following school buildings in Chicago: Longfellow, Burr, Langland, Arnold, West Pullman, Cornelia street and Hyde Park High School. Also Empire Theater, West Madison and Union streets; Medina Temple, Jackson street and Fifth avenue; South Chicago Police Station; Ovington Lunt Library and Dental College, Northwestern University.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, are to supply a Unique hot-water boiler and Champion radiators for heating the residence of Warren Leland, Forty seventh street and Grand boulevard. A locomotive boiler and 175 Champion radiators for steam heating in Hotel Glenarm, Indiana avenue and Twenty-second street.

BENJAMIN F. SHAW, plumber and steam-fitter, at 315 Orange street, Wilmington, Del., gives steady employment to 30 experienced workmen. He has a number of men at work on a contract of several thousand dollars for the Scranton Traction Company, at Scranton, Pa. He has just completed the work on a nursery for Sparks & Hannum, South Wilmington, Del. A combination steam and hot-water system, with a 200 horse power boiler, is used, with more than a mile of piping. Hot water will be used until the weather becomes cold enough to require the use of steam. On completing this job it was tested, when everything was found to be working in a first-class manner. The nursery consists of eight houses, each 260 feet long and 20 feet wide. A feature of the plant is the use of the purlins that support the roof for watering the plants.

THE L. H. PRENTICE COMPANY, 205 and 207 Van Buren street, Chicago, are to furnish two tubular boilers, 60 inches by 14 feet, radiators, tanks, pumps, &c, for the school building at Sheffield avenue and Grace street.

A. KNOWLES, New Bedford, Mass., has received the contract for heating the Church of St. Hyacinthe with two Richmond steam heaters.

THE BLOCK in which is located the store of Hale & Burgess, at St. Albans, Vt., is being equipped with a combination hot-air and hot-water heater, the hot air for the lower floor and hot water for upstairs.

THE new St. Joseph's Orphan Asylum of Green Bay, Wis., will consist of a main building 54 x 170 feet and a wing 36 x 90 feet. The entire building will be heated by a hot-water system, and provided with modern ventilation.

THE BOARD OF REGENTS of the Agricultural College and Experimental Station at Oklahoma will receive bids up to October 16 for the steam heating and ventilating of the college at Stillwater, Oklahoma.

BIDS will be received up to October 9 for the necessary heating apparatus for an additional wing and assembly room to the Kansas State Normal School, at Emporia, Kan.

BIDS will be received up to October 9 for the construction of a general steam plant for heating and power at the Kansas State Agricultural College, Manhattan, Kan.

A NEW COURT HOUSE is to be built at Carthage, Ill., for Jasper County, and will be heated by steam.

BIDS will be received up to October 16 for the plumbing, tinning and heating work for two cottages for girls and a school and industrial building for girls at Whittier, Cal.

A 35 HORSE-POWER BOILER, steam pipe radiators and other fittings for steam heating will be required for the National Home for Disabled Volunteer Soldiers at Los Angeles, Cal.

THE CONTRACT for furnishing material and doing the plumbing, gas fitting, heating, tinning, galvanized iron and slating work for the State Normal School at Los Angeles, Cal., is about to be awarded.

W. L. PORTER & Co. of Minneapolis, Minn., have been awarded the contract for putting in the steam heating fixtures in the court house at Crookston, Minn. A. C. Perman will superintend the work, the cost of the job being $1040. The jail will be heated by steam from this same plant.

A STEAM or hot-water heating plant, not yet decided, will be used for heating the court house at Bowling Green, Ohio.

THE COUNTY COMMISSIONERS of Waverly, Minn., are about to have a heating plant placed in the court house.

ALEXANDER DON, the plumber, of Newark, does not confine himself to plumbing alone, and is now engaged in setting a Furman hot-water boiler in a residence at Long Branch, N. J., and has a contract for an $1800 heating job in Brooklyn, N. Y.

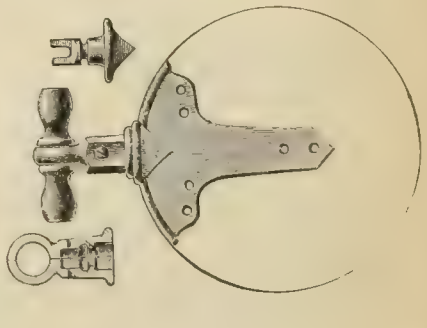
THE NEWARK HEATING & MFG. COMPANY, 36 Mechanic street, Newark, N. J., have just completed installing a Furman hot-water boiler in the residence of Hugo Geisslee, and recently installed a Silsby steam boiler in the Hook and Ladder House No. 1, Paterson, N. J, for heating the building and keeping the fire engine ready for immediate use.

WALTER P. DUNN, 98 Market street, Newark, N. J., has just completed the work of putting a Perfect hot-water boiler made by the American Boiler Company in his own residence. The Bundy Elite and Bundy Renaissance radiators were used. A large contract which has just been completed by him was at the St. Joseph's School. A large horizontal tubular steam boiler, made by L. J. Lyons & Co. of Newark, N J., was used for this job. The plumbing included J. L. Mott's system of automatic flushing water closets with overhead tanks and the roof was covered with Merchant & Co.'s Camaret tin.

The B. B. Damper Clip.

Berger Bros. of 237 Arch street, Philadelphia, are putting on the market the patented damper clip shown in the accompanying illustration.

It consists of an iron casing or sleeve made in two sections, one end gripping



The B. B. Damper Clip.

an ordinary damper shaft and the other end clamping a wooden handle, the whole held tightly together by a bolt. The handle is held or locked at a point close to the pipe sufficient to allow of a free turning of the damper. The method of locking or fastening the handle makes loosening impossible and obviates the grinding or wear on the pipe so common to ordinary clips. When inserting the disk in the pipe the handle need not be taken apart, as a few turns of the nut on the bolt unlocks it and it slips off whole.

White Caps in Eastern Mississippi and Western Alabama have posted notices on the doors of every cotton-ginning house in these districts that if a bale of cotton is ginned before the price shall have reached 10 cents the property of the ginners will be destroyed by fire.

STOVE TRADE NOTES.

The Future of the Hot-Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

THE HABITAT OF THE FURNACE.

The field for furnace work is a growing one. Originally confined to the Atlantic States, the hot-air furnace has followed the line of progress westward until no State or Territory has been able to resist its onward march ; within a few years even the South has grown to appreciate the luxury of hot-air heat, and the leading dealer in Memphis writes that he expects to put in between 50 and 100 furnaces this season. In the far Northwest it was but a short time ago when the first furnaces were sold, and now one salesman reports a total of 16 carloads for that section as a result of his spring trip. The first goods sent to that section were not suited to the requirements of the bituminous coal burned out there, and one carload sent to Portland in the early days had to be practically rebuilt.

Canada is calling for furnaces, and a recent number of *The Metal Worker* referred to a shipment to Ireland by a New York manufacturer. Germany has taken much interest of late in hot-air heating, and travelers from that country in attendance upon the World's Fair have given much attention to the furnaces on exhibition there as well as to other lines handled in Chicago, and some business will result.

FURNACES IN THE WEST.

It is interesting to notice the growth of furnace manufacture in the West, showing in a measure the demand in that section for hot-air furnaces. There was a time when Maine was the source of supply for the furnace trade, but at the present time an important group of manufacturers are springing up through out the middle West, although Eastern New York and New England control the lion's share of the business, and must continue so to do for some time to come.

A very large portion of the output is marketed in the territory west of Buffalo and Pittsburgh, and the development of the West during the coming 20 years will lead to a tremendous demand for furnaces. Chicago is and will be the largest user and jobber of furnaces and heating goods and will play an important part in the development of manufacturing these goods, for within her boundaries are produced the iron, steel, bolts, screws, and even the cement necessary for making the goods, and these advantages must eventually be recognized and appreciated.

The present financial stringency will have a bad effect on the silver States and for a time at least they will be poor customers for furnaces, but with the return to normal conditions they will become buyers of furnaces again, and a large trade will be built up in that section.

(To be continued.)

Computing Furnace Capacity.

The following interesting letter is from a correspondent well versed in furnace matters, whose attention was called to an inquiry for a rule for finding the capacity of furnaces. The suggestion was made that as the steam and hot-water trade could satisfactorily calculate the capacity of apparatus without an actual test, the furnace trade might be benefited if simple methods were published for calculating the capacity of furnaces:

Referring to article on page 49 of *The Metal Worker* of September 16 inquiring for a rule for finding the capacity of furnaces, I would say that possibly each manufacturer of a furnace has in his possession the necessary data for estimating the capacity of his own particular furnaces, but to get at a general rule that would apply to the majority of furnaces would be almost impossible, for the reason that each furnace works under different conditions, and it would be necessary to have some basis on which to figure. As, for instance, a given furnace with a certain diameter of fire pot and a certain number of square feet of radiating surface should be taken as a basis from which to estimate, and said furnace with said size fire pot and said number of feet of radiating surface should raise temperature of so many thousand cubic feet of air from a given temperature within a building to another degree of temperature with the temperature of the atmosphere without at a certain degree.

This would lead to so many complications that I doubt very much if any one could arrive at a rule that would be approximately correct. Now, if you will examine the construction of certain leading furnaces in the market, you will notice that they vary greatly, not only in the fire-pot diameter and cubical contents, but also in the amount of radiation above the fire pot, which would make it very difficult to properly estimate the capacities unless we should arbitrarily fix some such rule as this: The number of square feet of surface on fire pot should be considered in the calculation of the capacity of a furnace as being three times as valuable as the radiating surface of the smoke radiators above the fire pot; also the dome, whether cast or wrought, might be considered as having an efficiency per square foot of radiating surface of twice that of the smoke radiators. In order to get at the relative capacity of, say, the fire pot, dome and radiators, a thermometer might be placed at the different points indicated and in close proximity to the radiators, dome and fire pot, and the different degrees of temperature at these points noted.

Again, no furnace can be considered in its capacity without considering the position in which it is placed and also the chimney to which said furnace is to be connected. In figuring steam for mechanical purposes it is easy to compute the number of horse-power indicated, but we all know that the indicated horse-power is usually in excess of the actual horse-power developed by from 25 per cent. to 33⅓ per cent. Now, should we assume that a given furnace with a given fire pot and a certain number of square feet of radiating surface would raise a certain amount of air to a required temperature with the mercury at a certain temperature on the outside, we might consider the capacity of this furnace's normal condition to be the volume of the capacity which we have taken for the basis, but the conditions under which this furnace would work in different houses would be so very different that we would still have to give to this furnace a varying capacity such as is given by us and other furnace makers in figuring the capacity of a furnace.

Every one has probably observed in their experience in hot-air work that a furnace will heat a larger volume of air in an audience room where there are no dividing partitions than where the building is cut up into different rooms, and just why this should be I do not know.

ODD PLATES.

Superintendent Cowdery of the Milwaukee (Wis.) Gas Light Company states that 7000 gas stoves have been placed in that city, and are in use at the present time. Of this number 2600 were placed since January 1, 1893, showing that the use of gas for cooking is on the increase.

F. Farquhar & Sons, Blue Island, Ill., publish a circular illustrating and describing the Farquhar seamless furnace. The publication is neatly devised, small cuts showing general and sectional views of the Farquhar furnace.

At the Erie County, N. Y., fair, S. S. Jewett & Co., Buffalo, occupied a separate building for the exhibition of their well-known ranges. One of the features was the Brilliant oil stove. Fish & Kromburg were in charge, assisted by S. M. Hall.

The latest advertising vagary of the Globeille Pattern Company, Cleveland, Ohio, is a blue print 8 x 4½ inches in size, one-third of which is given to the company's sapiential trade-mark and an announcement concerning their facilities for making furnace and heater patterns. They also mention that their segment work is done by machinery. By way of emphasizing this last statement the remainder of the blue print shows a wooden dome apparently 6 feet or so in diameter, mounted on some special turning machine, with a workman in position at the tool rest with chisel in hand.

An English firm, Morwood, Sons & Co., Harleston Iron Works, Sheffield, are reported to have in hand some notable examples of cooking ranges for European and other navies. They have just completed, says the *British Trade Journal*, several unusually large ranges

for the Spanish Government. These appliances are all self-contained and made of steel and iron, carefully fitted together and tested before leaving the works. They are not dependent on a bricksetter making the flues right, everything of this sort being finished complete before leaving the premises. They consist of a series of roasting and bread-baking ovens, cooking and water boilers. Those used on board the large troop ships are of immense size, one apparatus being capable of cooking for 1200 men.

THE MANY FRIENDS of Thomas A. Douglass, the heating engineer with the Richmond Stove Company, Norwich, Conn., will be pleased to learn that he is now convalescent after a severe illness of two months, and sincere hopes are entertained that he will soon be able to be out among the trade.

PREPARATIONS are being made by nines composed of the molders and polishers of Rathbone, Sard & Co.'s Albany plant for a match game of baseball which will take place soon. It is understood also that a contest between the molders of Rathbone, Sard & Co. and those of the Littlefield Stove Company will come off in the near future.

JOHN KAMMERER of Gowanda, N. Y., made a fine exhibit of the Cortland-Howe system of ventilation at the Erie County, N. Y., Fair.

UNDER THE HEAD of "Heating the House and Cooking the Dinner," the Boston *Commercial Bulletin* reviews the trades interested. It says: "Usually in this month considerable business is done, but though money is less stringent, the fact that a little delay in making purchases in this line is less injurious than in some others has delayed the trade in a measure, and orders are somewhat restricted. Numerous small orders, however, have been placed with a frequency that shows an aggregate which has reduced the stocks very materially. Improvements are noted in hot-air furnaces, and the growing popularity of hot-water and steam boilers for house heating, and the introduction of what is called 'new combination' in the use of a water heater in a hot-air furnace. In kitchen goods improvements continually appear, through strife of the manufacturers to make more convenient as well as handsomer stoves, and the product of this year shows an advance in both respects."

THE ELECTRIC OIL & GAS STOVE COMPANY, 295 Pearl street, New York, are putting on the market a new square asbestos-reflector gas heating stove, which is known as the New Chief.

WE ARE IN RECEIPT from the Chicago office of the Peninsular Stove Company of a sample of the nickel plated shoe horn which the company are distributing among the visitors to their display at the World's Fair. The horn is of the usual form, finished with a high polish, and the back bears the inscription in sunken letters: "Compliments of Peninsular Stove Co., Detroit, Chicago, Buffalo."

LUTHER & LEDERHOS, 30 Cliff street, New York, are just sending out their catalogue of gas stoves for the fall and winter of 1893. It has a brown cover and contains 24 pages. The Brilliant Star, they say, is the handsomest gas heating stove on the market. It is of the round, open reflector style, and is provided with a door for lighting, as is also the Home Comfort, a square reflector stove. The enterprise is a new square heater that is made as a reflector, with an asbestos fire and with an asbestos pyramid gas log. The Eclipse is another new round open reflector, with a pyramid asbestos fire. The Model Radiator is new and attractive, one of its useful features being a water pan in the base. The Enterprise oil heater is entirely new, very pretty, and has a 15-inch circular flame. The base is ornamentally japanned and casters are attached to the legs. The Hercules oil heater has been improved and a heating drum added. Gas supplies of various kinds occupy the balance of the catalogue, which should interest the gas-stove trade.

THE CHICAGO & ERIE STOVE COMPANY of Erie, Pa., have added to their assortment of heating stoves a very attractive construction known as the Sapphire. The entire back of the stove forms a portion of the burner, there being nearly 400 small openings through which the gas flows. The back is composed of asbestos fiber and when the gas is ignited the appearance is that of an "incandescent sheet, shimmering with light." The front, top and bottom of the stove are cast iron, while the sides and back are of embossed Russia iron. The stove is adapted for burning natural and artificial gas, and the company state that where it is intended to use manufactured gas it should be so indicated in the order, as the mixer for this gas is different from that for natural gas. Attention is also invited by the company to another heater, which is made of cast iron and offered at a moderate price. The cold air enters between the back of the stove and a deflecting plate, passes upward, becoming highly heated in its passage, and is discharged through openings in the upper portion of the front. A detachable blower with mica illumination is provided, which prevents the escape of gas into the room in case of the accidental stoppage and reopening of the flow of gas occasionally occurring through the breakage of gas mains.

SOME DAYS AGO the works of the Richmond Stove Company of Richmond, Va., were visited by a slight fire, which was discovered in the carpenter shop. According to a local paper, the blaze was caused by a spark from the smoke stack of the foundry igniting the sash of one of the windows. The flames were extinguished before the arrival of the fire department and the damage was trfling.

BUCK'S STOVE & RANGE COMPANY of St. Louis, Mo., have been distributing to the trade circular letters calling attention to matters in which dealers are likely to be interested. Among other things the statement is made that the company's foundry was run to the limit of its capacity from January 9 to July 29 of the present year, closing down at the latter date owing to the depression in general trade. Early in September, however, the company were encouraged to resume operations in all departments, and thus convey the impression that from their daily experience it was an error to have closed their works at all. Orders are reported heavy and to be increasing rapidly. The company urge upon their friends and customers to give prompt attention to stocks of stoves on hand and to enter orders without further delay, as it is "now evident that the demand for goods during the next three months will be overwhelming." One of the circular letters calls special attention to Buck's stoves and ranges, and also to the line of heaters made under the name of Buck's Oak. The latter is shown in several styles of ornamentation, and descriptive particulars enable the dealer to comprehend the salient features of construction.

THE MICHIGAN STOVE COMPANY of Detroit, Chicago, Buffalo and New York City have issued a stock sheet of special bargains in hard-coal heating stoves, soft-coal heaters, wood heaters, hard-coal ranges, soft-coal ranges, wood ranges, hard-coal cooking stoves, soft-coal cooks and wood cooks, comprising styles of 1892 and immediately preceding years. Net prices are given in the stock sheet, and the statement is made that the goods are strictly first class and salable in every particular. They are all subject to previous sale. A very neat circular is issued by the same company illustrating their Art Garland reflector-top base burner, which is made in three sizes plain and in two sizes with oven. A number of new features have been introduced for the present season. A sample has been sent us of the new telescopic pocket match box, which will be distributed through Garland agencies.

SAM S. UTTER, 113 Beekman street, reports that during the summer he has been busy in shipping goods to various points throughout the country. Mr. Carey, his Boston agent, has added an extension to his already capacious store to make room for a bigger show of oil and gas stoves, as well as a full line of Sam ranges. The Sam range has now attained its fifteenth year on the market and still continues popular among the dealers. It is made in 26 sizes and kinds, having all the modern improvements, including large oven. Sam is ably assisted in the management of his business by his son, John Utter, who has been brought up to the stove trade since he was a boy.

A DISPATCH from the St Louis representative of *The Metal Worker* reports that the demand for stoves, coal hods, stove trimmings, &c., is very heavy in that section, mainly on account of the cold weather at present prevailing throughout the entire West.

CHAS. O. LYON, president of the Thatcher Furnace Company, 33 Peck slip, New York, returned to New York on Tuesday, after an absence of four weeks. During that time he visited the principal cities in the West, calling on their agents, who reported increased sales for the Thatcher furnace and ranges during the year. Their agents in Des Moines, Iowa, St. John & Barquist, report that their sales have doubled as compared with the sales a year ago. Several agencies have been established at other points where there were none already. Edward Benedict, treasurer, who has full charge and supervision of their foundry in Newark, is working with a full force of 75 men. Many improvements have been added during a short summer recess, making their establishment a complete one in every respect.

THE BRAND STOVE COMPANY of Milwaukee, Wis., have recently resumed operations with a large force and report the receipt of orders from all parts of the country. Members of the concern express the opinion that the prospects for the fall are encouraging, and that a good volume of business will result.

THE HOUSEHOLD STEEL PLATE RANGE is the subject of a very pretty pamphlet which reaches us from the Columbus Steel Range Company, 188, 190 and 194 West Broad street, Columbus, Ohio. The range named is care-

fully described, attention being called to the features incorporated, while directions for using the Household are likely to interest wide-awake dealers who desire to thoroughly understand every selling point in connection with the goods they handle. The engravings employed to illustrate the Household are photo-reproductions and give an excellent idea of the features of ornamentation. The Household is made in a number of styles and sizes adapted to meet varying requirements. In its construction the manufacturers claim they use nothing but Nos. 14 and 16 gauge cold-rolled steel, the parts being closely riveted, every joint cemented and the ovens securely braced with heavy bar iron, thus preventing warping or springing apart. Among the features incorporated in the Household may be mentioned oval fire chamber, ventilated fire back, shaking and slicing grate with draw center, asbestos-lined flues, cut long centers with supports, oven ventilator, large cast water back tested to 110 pounds steam pressure, capacious ash pan, malleable iron oven-door frame and hinges, attractive front corner posts or columns and japanned body.

GEORGE M. CLARK & Co. of Chicago, Ill., issue a very neat catalogue of 40 pages, bearing the suggestive title of "Jewel Gas Heating Stoves." These goods are well known to the trade and have established for themselves a wide reputation. The Jewel perforated heaters are of such a character as to present a very brilliant appearance when in operation as well as being powerful in the amount of heat radiated. Concerning these heaters the catalogue says: "By the combination of the perforated body and base, construction of burner and position of deflector, the largest possible amount of heated air is distributed through the perforations near the base of the stove. The cold-air current which is constantly passing between the floor and the base of the stove feeds the burner and cylinder with fresh air to be heated and at the same time protects the floor from the heat. The burner is made in such a form and the cold air is admitted in a manner to produce the best combustion; hence there is no odor." The perforated goods shown in the catalogue are known as the Jewel Colonial, the Jewel Pioneer and the Jewel Sparkle. The little volume is neatly printed on good paper, bound in colored paper covers and presents a great deal of information of interest and value to dealers handling stoves intended for burning gas.

THE SUPERIOR STOVE COMPANY of South Superior, Wis., resumed operations a few days ago with a force, we are informed, of about 50 hands which it is expected will be kept busy all through the winter. General Manager John D. Green is reported to have expressed to the representative of a local paper the following views with regard to the outlook in the stove trade: "The stove business this year will not be what it has been at other and better times. People who in easy times would heat a ten-room house will this year close up half the rooms and heat but five. Everybody will live close and economize. Still, business will constantly enlarge as time goes forward."

THE WOLFF GAS RADIATOR MFG. COMPANY of 164Franklin street, New York, by means of tastefully printed circulars call especial attention to their new styles and patterns of gas radiator, with open-work base and nickel trimmings, with or without flue connections. The flue-connection radiators are made especially for natural gas, principally for Northern Ohio and Indiana, where the gas is more or less charged with sulphur. The superior quality of natural gas in Western Pennsylvania permits of good results without flue connections. The company have also issued a large poster, lithographed in bright and varied colors, showing the Wolff radiator very much as it would appear in operation.

A. R. CANFIELD, New York, manager of the Danville Stove & Mfg Company of Danville, Pa., has just got his showrooms arranged with a display of their latest goods. On entering, a Beaver Franklin, resting on a mosaic tile mat, greets the eye. Then comes, mingled with the old standard goods, the Princess Beaver, a new square parlor made half and full revertible flue and as a double heater. Next the Queen Beaver, a new square range that is said to do handsomly as well as be handsome. A new high shelf that quite holds its own with the range is one of its appurtenances and another of this year's productions.

Traveling Salesmen.

BY JEEMS.

When you go to the old fashioned circus you always hear the ringmaster order, "Now then, Mr. Merryman, see what the young lady wants," as she brings her steed to a halt after her first excursion around the ring. The "young lady wants the banners," replies the clown with a great flourish of speech, and the banners are brought forth. So it is with stove conventions, the traveling salesman is a feature in the ring, and he is made to hop over the banners and vault through all the balloons just as if he was the fellow who invented all the perplexing vexations which settle deep in the brain of the weary employer and make him long for their total abolition from the face of the earth.

It is quite interesting to read the essays regarding the gentlemen who are professionally known as "traveling salesmen," as to what they should be and do to gain and merit this title; in short, what a bang up first-class hustler ought to be. It all reads well, and no doubt it is the proper caper to possess such qualifications, and those who have them should be looked up to and copied by the younger gentlemen who are in the profession, or who intend to take it up. They cannot, I am sure, do better than acquire the qualifications so charmingly described. It might be said that a very good sort of a traveling salesman is a chap who could sell the most goods at the biggest profits, and not make a bad debt. This qualification could be a set off against those nice niceties which the ideal ought to have. To be sure he might have all the others, but as between the two it is probable that the latter would be a sort of a recommendation, even if the cut of his jib or the style of his cady were not of the latest pattern.

Before the terrible era of high art took possession of the stove trade the boss used to have drummers come around the shop, but there wasn't so many then and they did not come so often; in fact, our shop was a sort of headquarters for the boys. The old man wasn't so dyspeptic them days, and was as full of fun as any of them; but it is different now. The old man don't keep up with the times. He does, however, run a bang-up tin shop, but no new fangled things are tolerated in it. Old Tim, our foreman, runs the shebang, and he has got a lot of old customers who won't buy only of the boss, because they "kin always reckon on his wares." So we are not favored much with visits from the profession. The old man used to have one of them flat-backed, bleareyed, fat black-and-tan female terriers. She got to be a very knowing creature, and was quite curious at times about strangers. She used to lay in the store where she could see the door open, and the chances were if a traveling man came in she would waddle out to look him over, at least it seemed so, and if she liked him she would wag her tail —that is, she couldn't give it a full wag because of an accident, but it was still a dog's greeting. She couldn't cock her head up full dog-fashion, neither, but she would show her pleasure through her bulgy eyes, and if she liked the fellow it was a pretty sure thing he did business with the boss. If she didn't fancy a man she would trot up to him, look him over for a moment, and walk slowly back in the shop and settle down with a tired look and a big sigh that was truly affecting. The dog was generally right, for the fellow was usually a duffer. It shows that even dogs have an intuitive instinct regarding these gentlemen. The old man does not sour on traveling men exactly, but he doesn't feel so much interest in them as in old times. His son Jack looks after the store, and does most of the talking. But Jack is as fresh as they make them, and when he is in the humor he likes to put his knowledge on parade, and the consequence is the shrewd ones are "on to his curves," and generally knock him out. Jack's weakness is baseball; he eats, drinks and sleeps baseball, and if any traveling man has the same weakness he can be Jack's friend. There is one fellow who hates baseball with a vengeance, but he has managed to get an order out of Jack several times. He has been letting Jack post him on the game, says "Jack is an oracle, and the most perfectly posted man he ever met on the subject." But if you were to ask him four minutes afterward about the game he wouldn't know what you were talking about. He never pays attention to Jack's talk, but waits his opportunity to get a home run, and he gets there.

Of course all buyers are not like Jack nor all dogs like the boss's, and it is an open question what are the qualifications for traveling men. All men do not do business on the same lines, the most careless and improvident succeed sometimes when the alert expert does not. It could not be tolerated that the careless plan is the correct one, but all these things are quite perplexing, and so it is with the traveling man. It is a pretty difficult thing to find the ideal, especially for the stove trade; not but what it should have the best, but there are too many more like the boss who are set in their notions and "what they used to do" is the only rule and guide they know, and all else is bosh. But the world moves, and the chances are much against those who are going to keep up in the race on "what they used to do," and no doubt a much better grade, or if not a better one perhaps different methods, will be pursued both by the makers and venders of the greatest stoves on earth, as well as the inciters of public interest in them, who are so much of a stumbling block at present to their employers.

Gas Lighting, Heating and Cooking.

A FEATURE of the English gas stoves exhibited by the dealers in New York is the universal provision made for a chimney connection, and a feature of the American stove is the almost universal absence of such provision. The combustion of anything that goes on continually in a closed room will vitiate so large a portion of the air that the advantage of a chimney is apparent.

THE SHOW WINDOW of Excelsior Hardware Company, 58 Warren street, New York, makes a fine display of gas radiators and English wall fires. The newest English wall fire or open grate is handsomely ornamented with tile, and the fire chamber is filled with material that becomes incandescent when in operation, presenting a cheerful appearance and furnishing a strong radiant heat.

THE MAYOR of PHILADELPHIA and Director of Public Works Windrim are working together in an effort to get the City Council to reduce the price of gas from $1.50 to $1 25 per 1000 feet.

THE MANHATTAN GAS HEATING COMPANY, New York, is the name of a new company incorporated, with a capital of $15,000, for the manufacture of heaters to burn natural, artificial and gasoline gases.

THE ENTIRE RESTAURANT OUTFIT of the Illinois Central Railroad at Chicago, including boilers, ranges, carving tables and urns, all for burning gas, was supplied by W. M. Crane & Co., New York.

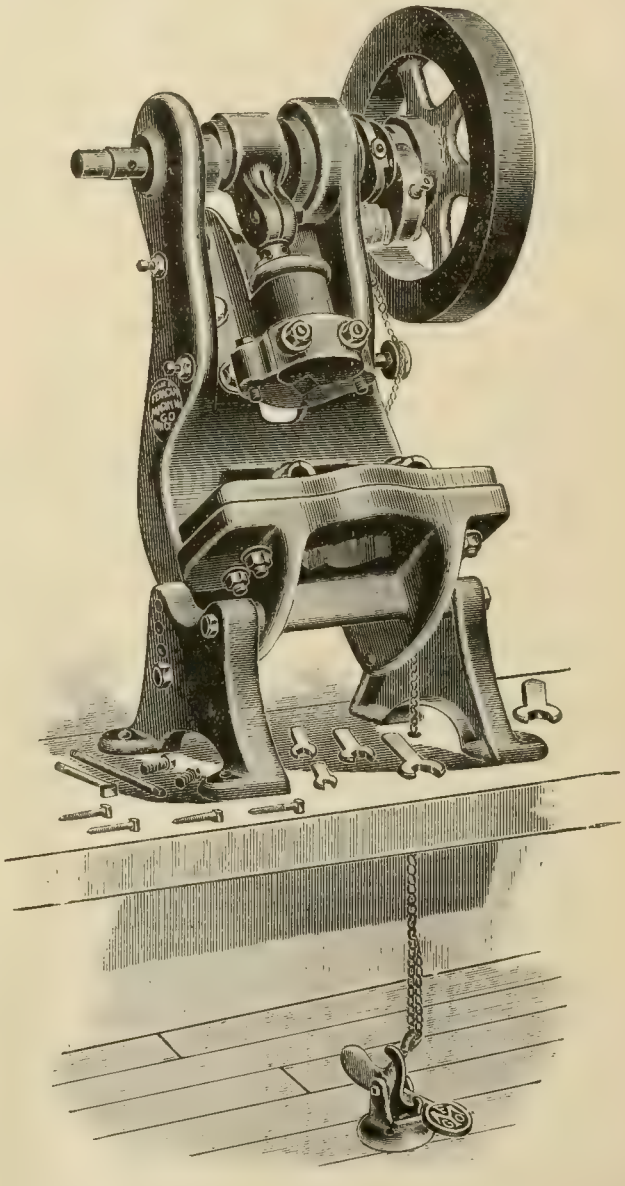
FREQUENT AND ENTERTAINING EXPLANATIONS of how to use gas and what can be accomplished with it for domestic purposes other than lighting, is advised for the extension of its use and benefits by those who have had most experience with the consumers. To this might be added some information on lighting.

The Ferracute Inclinable Bench Press.

A new inclinable power bench press has been recently brought out by the Ferracute Machine Company of Bridgeton, N. J., from designs by Oberlin Smith. By the makers' new system of classification it comes under Class C, cutting presses, and Series 100, bench presses. Being of the first size, it is known as press C101. It weighs 875 pounds. A second size, of the same design, known as press C102, weighs 1275 pounds. The picture shows the machine in wholly inclined position, from which it can be quickly changed by withdrawing and reinserting in other holes the two rear leg bolts. The treadle is provided with a lock by which it can be set to stop in the usual way each time the foot of the operator is raised, or so that it can remain down for continuous running. Its dimensions, &c., are as follows: Hole through bed 6 x 8 inches, rectangular, with an 8-inch round hole intersecting the same; hole through back, 11 inches; throat, from center of ram back to frame, 6 inches; hight from bed to ram when up, 9½ inches; stroke of ram, 2 inches; adjustment of ram, 3 inches; fly wheel, 24 x 3½ inches; weight of fly wheel, 230 pounds; revolutions of fly wheel per minute, 120; thickness of bolster, 2 inches; round hole in bolster, 4 inches; pressure safely exerted by ram, 12 tons Extra bolsters with various sizes of holes are also furnished to order. Such presses as these are adapted for a great variety of cutting, forming, spring drawing, &c, in sheet metals of all kinds, together with leather, paper, cloth, &c. The frame is so mounted upon its legs as to be quickly inclinable to any desired angle by the elevating screw, together with proper clamping nuts for securing the same.

This press has an unusually heavy ram, arranged with very long and wide bearings; an extra long pitman adjustment, graduated to hundredths of an inch; proper arrangements for clamping various kinds of punches; a positive knockout when desired, &c. The bolster can be made to order with various sizes of central holes, and is provided with die-clamps, adjustable in T-slots upon the top face thereof.

The shaft is of forged steel, with unusually large and long journals. In an enlargement of its solid metal is mounted an automatic stop-clutch of the utmost simplicity, and which, withal, has its different members so interlocked with each other in the process of assembling as to require no nuts or screws whatever, these being objectionable in a device of this kind, where the tendency is to constantly knock them loose. This clutch is provided with a safety lock which, while performing other functions incidentally, can be so manipulated as to prevent the press from starting while dies are being set, &c. A new and valuable feature consists in a so-called "clutch plate," carrying the tripping device, which is adjustable around the shaft's axis, thus allowing the clutch to be tripped either earlier or later than the normal, to accommodate itself to varying degrees of momentum in the shaft and parts attached thereto, this momentum being dependent upon the conditions of speed, lubrication, extra weights upon shaft (as cams, gears, pulleys, &c.), and other circumstances which usually have to be controlled entirely by a brake, thus in many cases losing a large amount of power. In the hub of the fly wheel, besides four hardened wheel studs for driving, there are also mounted self acting locking pins, which, while allowing the clutch slide in shaft ample time to enter spaces between wheel studs, finally lock the same after entering, and thus prevent the annoying back-lash incident to the use of spring-drawing dies and elastic work of various kinds.



INCLINABLE BENCH PRESS.

TRADE REPORT.

The Iron Market.

Chicago is the only locality which sends fairly cheerful news. From all other producing and distributing centers the reports are blue, in spite of a natural disposition to gather eagerly any indications pointing even distantly to better times. It is useless to deny that a feeling of sharp disappointment is becoming more and more general.

The simple fact is that there is not business enough going, by far, to keep those running even partially who have attempted to start. Every one of the works which have re-entered the list of active producers wants to cheapen cost by securing full employment. The result is a desperate struggle in which prices hitherto unheard of are made. It is useless to plead that special circumstances make such transactions exceptional. They are so numerous considering the small volume of business doing that they control the situation. It may seem paradoxical to state that the easing of the money market has made matters worse, and yet it is true that those who had advanced on merchandise or had given accomodations are putting on pressure now since they believe a course to be without serious danger which a month since would simply have crowded the borrower to the wall.

A survey of the whole field proves that consumption has not recovered sufficiently to give employment to many producers and that therefore the majority have the choice of stopping for a considerable period or of selling below cost. Those who do not have obligations to meet will probably take the former alternative.

In the New York market the lot of 1500 tons of warrant Charcoal Iron has been withdrawn from auction, and at the present time none of the bankers' holdings seem to be pressing. There are some indications, however, that merchants are selling at very low prices, in tributary markets, Pig Iron on which they had made advances. Reports of low offerings continue to be made in different quarters, and the market continues irregular and decidedly in buyers' favor. Makers of standard Irons report a moderate current business and a satisfactory rate of shipments, considering the light production. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

The demand in the Philadelphia district is reported as being of a very languid character, and although production is understood to be less than half of what it was six months ago, there is still more than enough to supply the demand. There is no particular pressure on standard brands, but once in a while outside lots are offered at prices below anything heretofore mentioned. At present only small lots are taken, and usually at prices about as follows for Philadelphia and equivalent points: $12.50 @ $13, delivered, for Plain No. 2, $13.75 @ $14.25 for No. 2x and $14.50 @ $14.75 for No. 1x.

From the Chicago district it is reported that there are at last symtons of a little hardening in prices. This is especially noticeable among sellers of Southern Coke Iron. The companies conspicuous for making low prices recently have either withdrawn from the market or advanced their figures beyond recent quotations, so that for the first time for several weeks the figures given below are not subject to concessions for prompt cash or large lots. Quite a number of season contracts both for Northern and Southern Coke were placed during the last week, and more contracts for local Coke are pending. Consumers generally are talking much more cheerfully, and report that if their trade continues to pick up as it is now doing they will soon need more Iron. Quotations are now as follows for cash:

Lake Superior Charcoal	$16.00	@	$16.50
Local Coke Foundry, No. 1	13.50	@	14.00
Local Coke Foundry, No. 2	12.75	@	13.00
Local Coke Foundry, No. 3	12.50	@	12.75
Local Scotch	14.00	@	14.50
Ohio Strong Softeners No. 1	15.50	@	16.00
Southern Silvery, No. 1		@	14.50
Southern Silvery, No. 2		@	14.00
Southern Coke, No. 2	12.35	@	12.60
Southern Coke, No. 3	11.60	@	11.85
Southern, No. 1, Soft	12.35	@	12.60
Southern, No. 2, Soft	11.85	@	12.10
Tennessee Charcoal, No. 1	16.00	@	16.50
Alabama Car Wheel	18.50	@	18.75
Hocking Valley, No. 1	15.25	@	16.00
Jackson County Silvery	16.00	@	17.00

Pittsburgh advices intimate that no business of any consequence is being done in Pig Iron at that center, and the industry is in a deplorable condition, with little prospect of immediate improvement, as it will take considerable time to work up stocks on hand, which at many of the furnaces are very heavy. In Foundry Irons there is little doing, the very low prices failing entirely to stimulate business. Considerable Iron from the Shenango Valley has been sold in that market at prices from $3 to $5 ℔ ton under our quotations, but the sales were made for the purpose of realizing cash. Quotations are given as follows:

No. 1 Foundry	12.75	@	13.00,	cash
No. 2 Foundry	11.75	@	12.00	"
Charcoal Foundry No. 1	14.00	@	15.00	"
Charcoal Foundry No. 2	13.00	@	14.00	"

The demand for Pig Iron during the week in Southern markets has been small, even for a dull season, although the two previous weeks were marked by considerable activity, and although low prices prevailed it was welcomed by the trade as the beginning of better things. The dilatory action of the Senate is, however, holding the manufacturing interests in check, and the hope of improvement has not been realized. Sales have been light, and while there does not appear to be any urgency to sell, it is apparent that Iron can yet be bought as low as ever. There is little Charcoal Iron selling, but the jobbing sales of small lots include nearly all kinds. For the time being the aspect of the market is discouraging. Quotations as follows:

Foundry.

Southern Coke, No. 1	$12.75	@	$13.00
Southern Coke No. 2	10.75	@	11.00
Southern Coke No. 3	10.25	@	10.50
Ohio Soft Stone Coal, No. 1	15.50	@	16.00
Ohio Soft Stone Coal, No. 2	14.50	@	14.75
Lake Superior Coke No. 1	15.00	@	15.25
Lake Superior Coke No. 2	14.00	@	14.25
Hanging Rock Charcoal, No. 1	18.50	@	19.00
Hanging Rock Charcoal, No. 2	17.50	@	18.00
Tennessee Charcoal, No. 1	14.00	@	14.25
Tennessee Charcoal, No. 2	13.00	@	13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75	@	18.00
Lake Superior Car Wheel and Malleable	17.00	@	17.25

Metal Market.

Pig Tin.—The leading operators have continued to mark prices higher and on Tuesday succeeded in carrying the net cash rate for round lots up to 21¢ ℔ lb, making an advance of about ½¢ for the week, and, besides, narrowing the margin of difference between prices for deliveries for various options during the balance of the year to a very fine point. Some dealers who stocked up when prices were much lower have unloaded, in part at least, but there has been no sign of "short" selling, and the surface indications are that the statistical position has improved, since sales to interior dealers and consumers have been quite up to the average for the season. It is estimated that at least 450 tons have changed hands on the advance, nearly all for delivery during the next two or three weeks, and that the supply in first hands is now down to about four months' consumption, with the greater portion controlled by a few firms. Following the advance in wholesale prices, jobbers are now quoting an advance of

¼¢ ₱ lb on small lots of Pig Tin, for which the ruling prices are for Banca, 22½¢, and Straits 22¢. The retail demand shows considerable improvement over the past few months.

Copper.—The market is looking a little ragged. Semi-official data show that production is well up to the average. It is also a matter of record that exports latterly have been quite heavy, or considerably above the average for the first half of the year; yet there is no lack of evidence that current production suffices to make good the drafts upon old surplus, and the general report would warrant the statement that supply is running ahead of the demand, since sales have been difficult to make at prices that looked low at the close of last week's report. Close market prices just now are about 9¼¢ @ 9⅜¢ for Lake Superior Ingot; 9⅛¢ @ 9¼¢ for Electrolytic; and 9¼¢ for Common Casting brands, in wholesale quantities, for delivery during the balance of the year. Nothing more than strictly routine business on home account has been effected during the past week, and the demand at present is hardly up to the average. The price on small lots of Lake Superior Ingot shows some signs of weakness, ¼¢ less ₱ lb being quoted by dealers during the past day or two.

Sheet Copper.—There has been quite a brisk demand for Sheet Copper during the week. Although orders are still confined, in the main, to moderate quantities, their volume has increased, and a few comparatively important sales have been made within the past few days, while the general run of retail orders have a tendency toward calling for larger-sized lots than consumers have lately been inclined to take. It is said that some architectural contracts which have been pending during the late stress have now been consummated, and the Copper is required for work to be put in hand at once. On the whole, the volume of business doing is pretty well up to the average for the season, and largely in advance of anything that has been done for some months.

Pig Lead.—The official bullion price has been lowered to 3.65¢. Further than that there is no change, although the market has remained very quiet. There are buyers now at 3.75¢, regular, and sellers at 3.80¢ are comparatively few. Most holders ask 3.85¢ upward. In other words, the market is a "waiting" one and extremely uncertain for the time being, as well as unmistakably quiet in this quarter. There is no speculation worthy of the name and dealers and consumers operate with extreme caution, purchases of larger quantities than carload lots being almost unknown. The retail consumptive demand continues very light, quotations remaining unchanged.

Lead Pipe and Sheets.—The market for manufactured Lead shows no sign of increased activity. Plumbers' supplies are quiet, the demand being much below the average for the present season.

Spelter.—Hardly enough business has been done in this quarter to afford a fair idea of the status of the market for ordinary domestic brands. The offering is moderate, however, and the negotiation would indicate that surplus supplies have been cut down considerably since the recent curtailment of production. In any event the offering is smaller, and ordinary brands do not appear to be available at less than 3.80¢, landed here, for delivery during the balance of the year. For small lots of Western Spelter 4½¢ @ 4⅝¢ is asked, with but little demand from consumers.

Antimony.—The market has been quiet, but prices remain stationary. Cookson's is quoted at 11¢ ₱ lb, and Hallett's at 10½¢, for small quantities.

Tin Plates.—Business in the market for Tin Plates, although maintaining a very fair volume, has been somewhat quieter during the past day or two, due probably to buyers postponing their purchases until after the first of the coming month. A slackening down of orders toward the close of each month is, indeed, a feature of the trade which has become quite regular of late years, therefore the present condition is only in line with the usual experience of dealers. Ordinary Cokes have been in good demand for prompt delivery and prices for the same show some improvement, especially for certain sizes which are becoming scarce. Other Plates hold their own in price, with a very fair running demand, usually for immediate shipment. Stocks at the mills have become considerable reduced, and certain brands of domestic Ternes which are in favor are practically out of the market owing to orders running ahead of capacity of production. But little interest is yet manifested in future business, and shipments from the other side are likely to be restricted to bare requirements until something definite is known as to the probabilities of tariff legislation.

A special cable dispatch to *The Iron Age* dated September 27 reports the London market for Tin Plates to show a somewhat better feeling, but prices have undergone no radical change. The improvement has been chiefly in Oil sizes, for which several orders have been placed. A number of Welsh mills that were recently shut down because of miners' strikes have been restarted, and stocks at present are liberal. Liverpool quotations are as follows:

IC Charcoal, Alloway grade	12/9 @ 13/3
IC Bessemer Steel, Coke finish	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12/
IC Coke, B V. grade, 14 x 20	11/6 @ 11/9
Charcoal Terne, Dean grade	@ 11/6

Sheet Iron.—A better demand for Black Iron is reported, for which, however, the increased output of the last few weeks is more than adequate. So much trade is done in this material directly between the consumers and the mills that the experience of jobbers is hardly a fair gauge of the volume of business that is going, which must be fairly large to meet the increased requirements of the Stove, Roofing and Galvanizing trades at this season. Galvanized Iron continues in steady demand, which is being fairly met in the resumption of operations by some manufacturers of this material both East and West.

Chicago Report.

Scrap.—Dealers report trade very dull. They offer the following rates, Chicago delivery, to country collectors:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	6 ¢
Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2 1-10¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	2 ¢

Anthracite.—Business is steadily becoming more active. An unusually cold snap for the season has prevailed throughout the Northwest this week. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

WE ARE INDEBTED to Boas Brothers, 231–235 Greenwich street, New York, for a catalogue relating to Adamant Enameled Ware. The pamphlet contains 25 pages, illustrating a variety of goods of Adamant Ware, which is described as American shapes of German workmanship in standard styles. An extensive line of kitchen utensils and house-furnishing goods are enumerated, and a full list of sizes and prices is given. Boas Bros. also have a house in Hamburg.

CONDITION OF THE

Hardware Trade.

THE MARKET SHOWS but little change since our last review. The demand continues moderate and is perhaps not quite so heavy as a week or two ago. The trade are limiting their orders strictly to goods required immediately, and are showing a disposition to let their stock be exceptionally light or slightly broken rather than purchase at all freely. Manufacturers are quite generally resuming operations, but they are at the same time showing a conservative disposition not to produce many more goods than are quickly absorbed by the trade. It is gratifying to note the continued improvement in collections, and on this score there is much less complaint than a few weeks ago. The delay in the Senate in regard to the repeal of the Sherman act is causing some uneasiness.

Advices from Chicago.—The fall trade seems to have culminated, as business during the last week just about held its own with that of the previous weeks. The demand is still confined mainly to seasonable goods. General Hardware shows no improvement and jobbers are now satisfied that it will not improve until building becomes more active and industrial establishments are more fully employed throughout this district. Staple goods are moving in only moderate volume, which is perhaps less than that of two or three weeks ago. Brass Goods are doing somewhat better, and business is not quite so dull as it was in July and August. Tinware is in a little better request. The Heavy Hardware trade shows no change, the demand being confined almost entirely to Iron and Steel departments of such establishments. Collections are good, and little complaint is heard on this score.

Notes on Prices.

Wire Nails.—The demand for Wire Nails continues moderate, and in order to avoid accumulation of goods some of the mills are reducing production, with the possibility of shutting down before long if the conditions of trade do not soon show marked improvement. The orders received by them are for the most part for comparatively small lots, which are required promptly. In this condition of things it is not surprising that prices have weakened, and during the past week exceptionally low quotations have been made. The market at present is represented by the quotation of $1.30 to $1.35 for large lots at factory, some of the mills, however, refusing to meet these prices. The market is thus somewhat irregular, and the condition on the whole is far from satisfactory. It is understood that little progress is making in the negotiations which for some time have been carried on between the manufacturers in regard to an agreement for the regulation of production or prices, and in the present state of the matter it is not thought that it will be immediately consummated.

Advices from Chicago.—Manufacturers of Wire Nails report a good trade the past week, but it was confined to orders for immediate shipment. The influence of present business does not project itself far into the future, as some factories are again making arrangements to shut down, to remain closed until trade makes some decided improvement. The market is irregular owing to the efforts of certain manufacturers to unload some of their stock, although it is not understood to be heavy. General quotations for shipment from factory are about $1 45, Chicago. Jobbers continue to quote small lots from stock at $1.55 to $1.60.

Cut Nails.—With the small amount of building at the present time there is naturally only a moderate demand for Nails, and the Cut-Nail market is decidedly sluggish. In sympathy with the lower prices ruling for Wire Nails, both Steel and Iron Cut Nails are weak in price. The market is represented by the quotation of $1 for carload lots at mill, but it is understood that in some cases where the order is attractive, especially in the way of average, slight concessions are sometimes made. Small lots from store in New York are held at $1.25 to $1.30.

Advices from Chicago.—Manufacturers of Cut Steel Nails report a good condition of business for the season, but orders are confined to carload lots and seldom run heavier. Prices are maintained at $1 20 to $1.25 for factory lots, while jobbers quote small lots from stock at $1.30.

Barb Wire.—The demand for Barb Wire is moderate, and with more or less solicitude on the part of manufacturers to secure business prices are naturally somewhat irregular and slightly lower. The market is represented by the quotation of $2.30 to $2.40 for carload lots of Four-Point Galvanized at mill. Small lots from store are quoted at about the usual advance.

Advices from Chicago.—The Barb-Wire manufacturers are now cultivating the retail trade, and have consequently affected the price of small lots from stock. They are selling mixed carloads of Wire Nails and Barb Wire to this trade, and are absorbing a very large part of such business. Quotations on Barb Wire sold in this way are $2.55 for Galvanized, but this is shaded to the best buyers. Carload prices continue to run about $2.45 for Galvanized, with the usual difference on Painted. The Barb-Wire trade has grown somewhat better in volume, but is not yet up to what it should be at this season of the year.

Wrought-Iron Pipe.—The Wrought-Iron Pipe market is fairly regular in price, and there is a moderate but not heavy volume of business.

New Power Corkscrew.—This Corkscrew, manufactured by the C. T. Williamson Wire Novelty Company, Newark, N. J., is sold from the following list, which is subject to a discount of 40 per cent. to the trade:

	Per dozen.
No. 1243, nickel-plated applewood handle	$5.00
No. 1443, " " rosewood handle	5.50

Perfect Saw Jointer.—E. Bertram Pike, Pike Station, N. H., is putting this article on the market. It is sold to the trade at $6 per dozen, subject to a discount of 33⅓ per cent.

Glass.—The demand for Window Glass continues in about the same proportions as during the past two or three weeks, and stocks are becoming proportionately reduced. It is not now an uncommon thing to have orders but partially filled by manufacturers, and reports come of Eastern factories preparing to resume operations. Some of the Plate Glass factories are getting ready to finish up the rough Glass on hand. No understanding has yet been reached regarding wages for the coming season between Window-Glass manufacturers and workmen, and no changes in quotations have occurred.

Old Metals.—The market for Old Metals continued in the same condition of torpor that was noted last week. Prices are irregular, and the total volume of business done makes a very poor showing. Many holders of Scrap Iron are said to be disinclined to part with their stock at the present low prices, hoping for some improvement in the near future. Nevertheless, we hear of others who urgently require ready money, but who are unable to find a market for their holdings at even a concession on lowest quoted prices. The following quotations represent about the outside prices paid for Old Material in New York:

Heavy Copper	℔	lb	6⅜¢
Light and Tinned Copper	℔	lb	6½¢
Heavy Brass	℔	lb	5¼¢
Light Brass	℔	lb	4⅛¢
Lead	℔	lb	2¾¢
Tea Lead	℔	lb	2½¢
Zinc	℔	lb	2½¢
No. 1 Pewter	℔	lb	14¢
No. 2 Pewter	℔	lb	6¢
Wrought Scrap Iron ℔ gross ton	$13.00	@	$14.00
Heavy Cast Scrap ℔ gross ton	11.50	@	12.50
Stove Plate Scrap ℔ gross ton	7.00	@	8.00
Burnt Iron (delivered at mill) ℔ gross ton	5.00	@	6.00

Old Rags, Paper, &c.—No improvement is noticed in the market for Old Rags, Paper, &c., which continues dull, with prices as follows, delivered in New York:

No. 1 White Rags	℔	lb	3¼	@	3½
No. 2 White Rags	℔	lb	2⅝	@	2¾¢
Mixed Rags	℔	lb			2¼¢
Blues and 3ds	℔	lb	1	@	1¼¢

Manila Rope	℔			2 1/2¢
Jute Rope	℔	1 1/2	@	1 3/4¢
Mixed Rope	℔	3/4	@	7/8¢

Old Rubber.—The movement in this material is of the slightest character, and prices for New York delivery are quoted approximately as follows :

Car Springs, ton lots, ℔ lb.	....	@	$0.03 1/4
Rubber Shoes, carloads, delivered at factory, ℔ lb.	....	@	.03
Rubber shoes, less than carloads, ℔ lb.	0.02 1/4	@	.03 1/8
Large Hose, ℔ ton	....	@	9.00
White Wringer Rolls, ℔ lb.	....	@	.04 1/4
White Syringes, ℔ lb.	....	@	.05

Trade Notes.

I. P. FRINK 557 Pearl street, New York, is in receipt of a very flattering letter from H. M. Danforth, pastor of the Methodist Episcopal Church at New York Mills, N. Y., in which he refers to two 60-inch Frink Reflectors put in his church a year ago, and which have given most excellent results, furnishing a clear and brilliant light in all parts of the building.

FRANCIS I. MAULE, for many years a partner in the late firm of Pancoast & Maule, manufacturers of and dealers in steamfitters' supplies, Philadelphia, has recently opened an office at 328 Chestnut street, in that city, where he is prepared to undertake the preparation of advertising matter, or as he terms it in his announcements, the "manufacture of notoriety." During Mr. Maule's connection with the firm mentioned all the bright and catchy advertisements put out by them and so familiar to the trade were formulated by him. With his large experience his services should prove valuable to all needing assistance in this direction.

ON SATURDAY, September 23, the employees of the Republic Iron Works, manufacturers of Iron and Steel Sheets, South Side, Pittsburgh, Pa., were notified that operations would be resumed at once. During the shut down extensive repairs were made, and the works are now in shape for a steady run.

THE SANDWICH ENTERPRISE COMPANY, Sandwich, Ill., last week filled an order for several of their patent aërating cistern pumps to go to South Africa. One these pumps is exhibited by the company at the World's Fair in a booth in Machinery Hall, and attracts, we are advised, much attention from visitors.

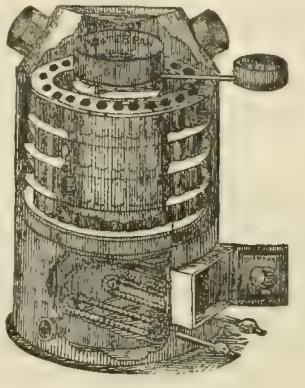
THE STUART & PETERSON COMPANY of Burlington, N. J., manufacturers of Hollow Ware, recently received a communication from a merchant in Zanzibar, in which reference was made to the high reputation of their goods in that country.

A HANDSOME DISPLAY of Venetian iron work and brass work in Table Lamps, Piano Lamps, Music Racks and Tables, in which there is a free use of onyx and Japanese pottery, will be found at the New York office of the Matthews & Willard Mfg. Company at 40 Murray street. Mantel Urns, Pitchers, Ewers and Statuettes form a handsome line of ornamental goods.

THE FOUNDRY of the White Mountain Freezer Company, Nashua, N. H., has been started up on full time.

Pennsylvania Gas Furnace.

In the broken view presented herewith we show what is known as the Pennsylvania gas furnace, manufactured by R. Edmonds & Son, Warren, Pa. The furnace, as its name indicates, is constructed especially for using gas as a fuel, and the manufacturers claim



Pennsylvania Gas Furnace.

that the severe tests to which it has been subjected show it to be economical and satisfactory in operation. The engraving which we present clearly illustrates the general plan of construction. Edmonds & Son report a gratifying demand for the heater, and are running their plant nights in order to keep up with orders. The business is growing so rapidly that the present manufacturing facilities are inadequate, and new works are said to be contemplated in the near future.

The ventilating plant for the Post Graduate Hospital at Brooklyn, N. Y., will require 27 fans and the same number of electric motors. Some idea can be gained from this of its proportions and the engineering skill that will be required for its installation. That such a contract should be eagely sought is natural, but that the number of bids should be overwhelming and far exceed the number of establishments capable of fulfilling and responsible for so large a contract is a surprise. The bids were to have been opened on the 29th, and the rumor among the trade on the 28th was to the effect that already 68 bids had been filed and enough more were in course of preparation, to be yet handed in, to make a total of 100. The past summer has not been as satisfactory to the fan trade as was desired and may to some extent account for the excessive number of bids in this case. From the same source comes the suggestion that the specifications will have to be materially modified if the apparatus is to prove as efficient as similar apparatus when arranged in accordance with the ideas of experienced ventilating engineers. This, however, is likely to occur with any large work, and if the contract is awarded to a competent house consultation between their expert and the supervisor of the building will remedy all conflicting details.

News and Notes.

The competition of the new electric street railways in Brooklyn is being keenly felt by the elevated roads of that city. The decrease in recent traffic has necessitated a cut of 10 per cent. in the wages of all "L" road employees from October 1.

Insurance companies report an abnormal number of losses from the West during the past few weeks. One large agency, having a choice of Western business, finds Western losses exceed 60 per cent. of all.

The City of New Orleans has just sold for $700,000 cash down, to the New Orleans City & Lake Railroad Company a renewal from 1906 until 1956 of that company's extensive street railway franchises.

The new battle-ship "Indiana," which has been put into dry-dock at the League Island Navy Yard, Philadelphia, to receive her propellers, will, it is announced, be ready for her preliminary trial trip by the middle of October. The Government test of the triple-screw cruiser "Columbia," also built by the Cramps, will be made about November 1, when it is expected that she will exceed the speed attained on her preliminary trial.

Domestic coastwise trade, as recorded in the report of the New York Custom House for the year ended August 31, appears to be very satisfactorily growing in value. During the year under review the coastwise tonnage of the port of New York was 555,449 and the foreign tonnage was 1,011,176, valued at $109,145,615 and $107,120,344 respectively. In 1892 the tonnage of the coastwise trade of the port was 525,295 and the foreign 1,032,036, showing an increase in the former of 30,154 tons and a decrease in the latter of 120,860 tons.

Louisiana's rice crop will fall this year far below the average. A late estimate places it at less than 750,000 sacks, as against 2,000,000 sacks in 1892. The shrinkage is attributed to drouth. The farmers of the State talk of irrigation next year.

Great activity is reported from the United States torpedo station at New port, R. I., where a large number of important experiments are under way, including tests of a number of torpedo defense nets, the Ericsson submarine gun and the Cunningham and Edison-Sims torpedoes.

The building of oil-tank steamers has become an important branch of naval construction. There are at present 47 of these vessels afloat, varying in size from 666 to 4134 tons gross, while 17 more are building at European yards.

The price of raw sealskins has advanced 25 per cent. since the Behring Sea decision.

The German Imperial Government proposes instituting a state control of shipbuilding, a duty which has hitherto been performed by private associations. The competition among these associations tends, it is argued, to a lower standard of shipbuilding, a danger which might be avoided by Government supervision.

A tariff conference between Russia and Germany is to be held in Berlin next month, with a fair prospect of settlement of the present tariff war between these countries. It is said that Germany is ready to concede lower rates on Russian cereals in return for a reduction of the Russian duty on manufactures of iron and some other goods. Immense quantities of grain are piled up at Russian ports awaiting shipment.

The un-American proceeding of "persuasion by dynamite" was used by union sailors at San Francisco on Sunday against non-union men, of whom five were killed and a number injured by the explosion of a bomb thrown into their boarding house.

A bitter contest has been going on since August 3 between the elevator companies and the farmers in Minnesota, in consequence of the companies having applied for a permanent injunction on the erection of the State farmers elevator at Duluth, for which the Minnesota legislature have appropriated $120,000. On September 23, however, the application of the elevator companies was refused, and the farmers will now proceed to erect their own elevator.

The representatives of French workingmen sent to study the World's Fair reached Chicago in two divisions. One arrived on the 18th and the other on the 22d inst. They received a cordial welcome from prominent leaders of the Chicago trades unions, who are doing all they can to make the visit of their transatlantic friends pleasant. They are expected to sail from New York for France on the 30th.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

At once, first-class TINSMITH; good job. P. Monagham, South Amboy, N. J. Sept. 30

At once, a STEAM and HOT-WATER FITTER; one who is competent to take charge of jobs with a helper; state age, experience and wages. P. O. Box 80, Warren, Mass. Sept. 30

A first-class TINSMITH on tinware; one that can furnish some capital to manufacture and take part interest; write for particulars. H. W. Gazlay, 138 Groton avenue, Cortland, N. Y Sept. 30

A reliable, temperate TINSMITH, who understands roofing, general jobbing, inside and outside work, iron-pipe work, and has some knowledge of plumbing; write, stating wages expected and experience; a steady job for suitable man. J. W. Beard, Plainville, Conn. Sept. 30

At once, first-class MOLDER to take charge of brass foundry. P. O. Box 413, Trenton, N. J. Sept. 23

A good TINSMITH and GENERAL JOBBER, for all kinds of country work; steady job all year round. F. L. Frick, Manhasset, L. I. Sept. 23

Twenty-five CORNICE MAKERS; steady work; union wages. Bay State Metal Works, 49 Harvard street, Cambridge, Mass. Sept. 23

A good TINSMITH, one well up on furnace work and roofing. E. A. Perpall & Co., Flushing, N. Y. Sept. 23

METAL SPINNERS. John C. Jewett Mfg. Company, Buffalo, N. Y. Sept. 23

A first-class PLUMBER immediately; will agree to give a steady job to the right man. Apply with reference to Daniel F. Kelly, 76 Crown street, New Haven, Conn. Sept. 16

A New Gas-Making Process.

It is stated that a new process has been invented for manufacturing illuminating gas from wood, in regions where wood is abundant and coal is dear. If this be true, and if, as is further alleged, the process is cheap and applicable to the economical production of gas in small quantities for isolated dwellings and other uses, the invention has a chance for an extended application, with consequent increased demand for gas fixtures, gas fittings and gas fitters' work. The possibilities of wood as a material for the manufacture of gas have frequently attracted the attention of chemists, and some processes for utilization of sawdust and shop refuse from wood working establishments for this purpose have been devised. So far no remarkable progress has been made in this direction, but in these days of startling innovations it will not do to judge of the future of any line of invention by the past, unless the great surprises of the past are taken to indicate equally great possibilities in the future.

Economy of Fuel.

In these hard times economy is enforced along the entire line of business and household expenses. As very often managed, there are few articles of household consumption used more wastefully than fuel. In an investigation made some time ago to ascertain how much waste there might be under quite average conditions of furnace consumption, the ashes, &c., were saved that were discharged from two large furnaces in a school, to which, from the commencement of heating in the fall till its discontinuance in the spring, were fed 36 tons of good anthracite coal. Two men were employed to sift these ashes and sort out the clinkers and stones. Their wages were $1 each per day, and they did the job thoroughly in somewhat less than three days, receiving $5 for the work. The good coal removed from the ashes was then weighed and found to be 2½ tons. The cost of the coal delivered was $6.50 per ton. Hence, a little over 6 per cent. of the coal was saved, the value of which was $13 20, obtained at a cost of $5, a saving of $7.20 in the cost of the year's fuel. The weighing occupied some of the time of the men, which would make the actual saving somewhat greater. It was thought that the furnaces were not more than ordinarily wasteful of coal, and that they were managed with average skill. A considerable economy is possible in all kinds of heating apparatus by careful management in the supply of fuel as needed. Coal should be placed on the grates of heating boilers in sufficient quantity at each feeding to last a considerable time without further attention. It is a great mistake to keep fussing and puttering with a fire, and, by too frequent shaking of the grate and poking the fuel, to work through the grate an undue amount of unburned coal. The shaking and clearing out should be done thoroughly after a mass of ashes has accumulated under the burning coal; then, when the supply of new fuel is added, the fire should be allowed to take its own course, provided the draft is regulated automatically, as ought always to be the case when practicable.

Concerning Business.

It is not an easy matter just now to analyze the condition of trade with any confidence in the analysis. Every one remembers very unpleasantly the financial stringency of the late summer and the immediate effect it had on business. Since the meeting of Congress the money market has become easier, and trade has started up again in some measure. In just what measure, however, it is hard to tell. The daily papers are flooded with reports respecting the commercial and industrial situation. One set, with a view to proving that the silver law is the root of all business evil, read the commercial barometer by the light of the debates at Washington, and as unconditional repeal approaches the prospect brightens, and as prolonged delays make uncertain this repeal the prospect darkens again. The other set of newsgatherers base their opinions on the treatment of the tariff. Any indication that the tariff will be interfered with and duties revised is the occasion of a melancholy survey of the business condition, while the reassurance from Washington that Tariff matters are to remain untouched is the inspiration of a bright prophecy for business. And so it is that just at present ordinary sources of information respecting industrial conditions are more than usually unreliable.

Present Activity

Leaving out altogether these varying rumors, and basing conclusions on what has come under nearer observation, it is worthy of note that in many lines of trade there has been, and is, a good degree of activity. This, to be sure, is the busy season in heating lines, but many houses report an unusually large number of orders and good business. This might be explained by the delays in purchasing earlier in the year, but in the cases in mind the amount of business is figured since January 1, and shows that the year throughout has been by no means unsatisfactory. With respect, therefore, to the present condition in industrial circles, there is much to be found of a gratifying nature. The future is less reassuring. The household trades, if we may so class a large number of diverse industries that depend upon the building trade for their activity, are not over sanguine. Houses are being built and finished, of course, but the future work is of small proportions. It is the fear of light business next year, rather than regret for the small trade of the present, that is causing worry, which worry, it is to be hoped, will be proved foolish by events.

California Midwinter International Exposition.

The Department of Publicity and Promotion of the California Midwinter International Exposition issue, from the California State Building, World's Fair, Chicago, a circular letter in regard to the exposition to be opened in San Francisco, Cal., on January 1, and to which we referred last week. The directors of the California enterprise believe that its success is assured, and that there is no doubt of a large attendance of visitors from foreign countries and the American States other than those bordering on the Pacific Coast, judging from the interest taken by World's Fair visitors in the proposed undertaking. The railroad companies have promised to make a one-fare rate for the round trip, thus bringing the cost of a visit to the Golden Gate within reasonable reach of many who could not otherwise hope to get so far afield. In reference to the plan and scope of the exhibition, the managers observe that although the California Fair will not be as great in size as the Columbian Exposition it will be thoroughly international in character, and will show all that is best in the art,

science and industry of the world. Some of the best and most interesting exhibits in each department of the World's Fair will be removod from Chicago to San Francisco at its termination, in addition to which many novel and original displays will be made. A Midway Plaisance is to be as prominent a feature of the fair as that of Chicago, and many of the best displays from that place will go on to San Francisco, while a number of novelties are to be introduced. Foreign countries have been invited to co-operate through their commissioners, and we understand are entering heartily into the scheme.

Chicago's Unemployed.

Under the direction of the Mayor of Chicago an effort has just been made by the police of that city to ascertain how many persons are unemployed They visited 2187 establishments and found an aggregate of 111,016 persons employed, as compared with 186,602 ordinarily employed. The difference between these two aggregates is 75,486, and this is assumed to represent the unemployed, although claims are made by those who profess to be thoroughly informed on the subject that many establishments were not visited and that the number out of work is nearer 100,000. This is an appalling fact confronting the city authorities on the eve of winter. Cincinnati is in very much better shape than Chicago. A police canvass there shows but 4500 unemployed, and a liberal allowance for errors and omissions does not make the number over 6000. Citizens of St. Louis, however, claim that their city is in the best position of any of the Western trade centers, having no more unemployed than will always be the case in the best of times.

World's Fair Prize Winners' Exposition.

An Eastern sequel to the Chicago World's Fair is announced to be held this winter in New York. The form of the display is to be a World's Fair Prize Winners' Exposition, under which title it is to be opened on or about November 24, 1893, at the Grand Central Palace, closing on January 15, 1894. The idea is, we presume, to confine the exhibits to those which have actually gained prizes in Chicago. The original idea was to hold the exhibition in the months of February and March, but owing to the determination of the Columbian Commissioners to close the World's Fair on October 31, and at the solicitation of foreign exhibitors, who propose exhibiting in New York, the earlier date for opening was decided upon. The idea is a good one, as such a selection of meritorious exhibits will not fail to attract and interest many persons whose circumstances have not admitted of a visit to the White City. The exposition is under the management of the Manhattan Industrial Exposition Company, to whose office, at 122 West Twenty-third street, all applications for space should be sent.

A New Enamel.

Nobody is surprised, says the *Architect and Contract Reporter* of London, when they hear of a new application of science by Fletcher, Russell & Co., Limited, for already they have gained a reputation for their specialties that is world wide. Their latest production is more than useful; it will be an auxiliary to industrial art, and the advantages of it are not easily limited. The new Chimatto enamel is unlike the majority of enamels in the market, as it can readily be applied to iron, and produces a "matt" or dead surface of the sort that is more easily desired than obtained. So far as is known, it becomes as enduring as the metal to which it is applied; and it has, moreover, the advantage that it cannot be chipped. It can be produced in all colors and the most delicate tints, either dead or bright; gold and silver, either dull or polished, can also be applied to the same casting. They are equally unchangeable either when exposed to the air or to any heat up to a bright red. The film of enamel is, however, so thin that the most microscopic details on the metal are unchanged in form and character. The application is new and admits of a large extension for permanent decorative work of all kinds. Castings protected by the enamel are not only capable of fine artistic treatment, but they are absolutely permanent and proof against dirt and smoke, which disfigure other work so rapidly. Messrs. Fletcher, Russell & Co., Limited, have set up a special plant and buildings on a large scale specially for this new branch of their already extensive and varied business. Specimens of the enamel will shortly be exhibited in their showrooms in London, Manchester and Warrington. From what we have seen we have no doubt the new enamel will be at once accepted as indispensable.

Jim and the Fire Pot

Jim had for a long time wished that the boss would buy a gasoline fire pot, as the old charcoal arrangement was rather inconvenient to manage. When a job was to be done in a house it was necessary to either leave the fire pot out of doors until the "smoke" had burned out of the coal, or else fill the house full of fumes that would remind one of the time when a prairie fire had passed through a barnyard. Jim had been caused much trouble by the use of the charcoal fire pot. Once he was proceeding up stairs in a house for the purpose of making some repairs to a tin roof. He had hardly reached the roof when there was a cry of fire from below. A hurried retreat was made by Jim, when it was found that a piece of "live" coal had fallen out of the fire pot and started an incipient conflagration by coming in contact with the hall carpet. It was an easy matter to extinguish the fire, but the same could not be said regarding the hole burned in the carpet.

Then there were legal complications regarding who was responsible for the damage sustained by the carpet. It was easy to convict the fire pot of incendiarism in the first degree, but that would do little good, as the fire pot was without a bank account. Jim did not consider himself to blame, as he was simply using such materials or implements as his boss furnished. The boss did not care to purchase a new carpet for another man's house when it was Jim, in combination with the old fire pot, that had caused the trouble. It is curious to note what a complicated legal controversy can be kindled by one small piece of charcoal.

On another occasion Jim was climbing up a ladder inside of a new building, holding the fire pot with his left hand in the usual manner. When he started the fire was burning innocently enough, but before reaching the ladder top the fire was burning with great vigor, after the manner of fire pots under similar circumstances. If Jim dropped the fire pot, as he felt inclined to do, the attraction of gravitation would cause it to fall, and coming in contact with various boards and shavings below would probably cause the fire to be scattered and burn up the building. Accordingly Jim made great haste to reach the summit of the ladder, but notwithstanding the haste, his hand was broiled to such an extent that labor was out of the question for a number of days. In this instance there were many who lavished praise on Jim for his bravery and fortitude, but there were none to pay him for his lost time or ointments. It is not surprising that Jim desired a fire pot that would behave in an orderly manner. Accordingly a gasoline fire pot was ordered and duly received.

One day Mr. B. drove up to the shop to get some one to repair a lead pipe connected with the kitchen pump. This was a job for Jim, and accordingly the new fire pot was taken along. Arriving at the pump's residence, Jim proceeded to inflate the fire pot and ignite the vapor. For some time there was a great blowing and roaring, as the fire pot's lungs appeared to be out of order. This part of the performance being over, it was not long before Jim had his coppers hot and the pipe soldered. As they were driving back to the shop Mr. B. inquired regarding the price of such a heating machine, and where one could be procured. Upon receiving the desired information, Mr. B. expressed a desire to purchase one. As Jim did not clearly perceive any particular reason for the purchase, Mr. B. stated that his wife was a great scold, and when she once got started it was difficult to stop her. Accordingly, when she got on the rampage it would be only necessary to start up the gasoline fire pot, which would make about as much noise as Niagara, thus effectually covering, overcoming or obliterating the conversation of Mrs. B. Mr. B. considered a "blower" fire pot to be invaluable in every family where there was a "blower" woman. TIN CHIPS.

Ordinary boiled linseed oil is stated in the *Engineering Magazine* to be the best varnish known for cast iron surfaces. Of course the metal will not absorb the fluid as wood does; so the whole of the gums contained in the oil remain on the surface, where it is hardened by evaporation. It may also be a fact that there is some union between the metal or some of its impurities and the oil, for certainly it dries very soon and very hard. Few persons know how rich a surface a casting can have until they have experimented with it. A casting with a good surface pickled and washed with warm water or steam will be a rich brown. One pickled and not washed will be a peculiar gray, and one pickled and washed with cold water will be a brilliant red. Care must be had to not file or chip such castings more than necessary and to never attempt to improve the surfaces left by the sand, as that surface cannot be improved in artistic appearance by filing.

By the fall of a roof in the Dolcoath tin mine, near Camborne, Cornwall, on September 20, eight miners were buried under a mass of soil or entombed alive.

ROOFING AND CORNICE.

Roof and Sidewalk Light.

The illustration herewith shows a new glass light for roofs, floors, partitions, skylights and sidewalks, patented September 12, 1893, and made by J. C. French & Son, 452 Canal street, New York. In construction it consists of a wrought iron border and $\frac{7}{16}$-inch steel rods running crosswise and riveted at the ends after the glass has been placed. The glass eyes, which are ornamental, are 4 inches square, with grooves along their sides to fit the steel rods. After they are in place and the rods riveted to the frame, a cement is used te fill in the spaces. When finished one of these lights presents but little more obstruction to the entrance of light than the rods alone would present. In appearance the rods and cement seem a fragile support for the sheet of glass, but a test of 500 pounds per square foot shows that the necessary strength is provided. A smaller size round bulls-eye is used when desired, but the strength and the greater amount of light given by the larger square glass eye have made it the favorite. The glass eyes are of the white transparent kind, ornamented to secure privacy and at the same time let the light through freely.

Roof and Sidewalk Light.

Skylight Competition.

Henry M. Sanders of Washington, D. C., whose essay was awarded the first prize in *The Metal Worker* Skylight Competition, sends us the following corrections respecting the essay as published in *The Metal Worker* of September 23:

1. On the first page and first column of the essay, third line from the top, it reads, "As in the construction," &c. It should read, "In the construction," &c., omitting "As."

2. In my description of Fig. 2, Plate IV, on page five of the essay, second line of first paragraph, there is a discrepancy between my description and the number referred to on the plate. You will note the essay says, "In Fig. 4 draw the line E F at right angles with A 6 in Fig. 2." But in referring to the plate I find Fig. 4 in the pattern developed from Fig. 1 instead of the pattern developed from Fig. 2, as my description would infer. The correction I would suggest under the circumstances, since Fig. 4 cuts no figure in either description, would be to leave it out altogether and simply say, "Draw the line E F," &c., as it in no way affects the clearness of the description.

3. In my description of Plate V, fifth page, second line of second paragraph, I say: "As shown by K L in Fig. 1." Referring to Plate V, I find K on one line and L on the line above. They should both be on the same line.

4. On the sixth page, first column, eighth line down in third paragraph, referring to Plate VI, I say: "Dotted lines drawn from the miter *c* L *e* in Fig. 1." It should read, "*c* L" instead of "*c* L *e*."

5. In the description of Plate VIII, fifth line from top of first column on seventh page, I speak of "dotted line drawn," &c., but the dotted line does not appear on the plate.

Further down in this description on the second line above Plate X instead of reading "as *e a*," &c., it should read "as *b a*," &c.

6. Plate IX is designated as "The miter for the E mold." It should read "E bar," and so in all cases where the word "mold" appears in the description it should read "bar."

7. In my description of Plate IX, first line of third paragraph, I say: "At point *k* on line *i g* in Fig. 2 draw *k* L at right angles with it." Referring to the plate no such line appears.

FLASHINGS.

Hastings & Wolcott, New York Mills, Oneida County, N. Y., are having many inquiries concerning their quadruple roofing folder, which was described lately in our columns. They are also making some sales and have prospects of a large demand for the folder as soon as it becomes generally known. The machine is adapted for two locks for standing seam, as well as four locks for flat seam roofing.

J. Foerster & Son, 806 East Fifth street, New York, have recently completed the hip skylight work with glazed side sashes operated from below on the Ville Marie Convent, Lexington avenue and Seventy-ninth street, New York. They are also working on the galvanized iron cornices for the building 300 Tenth avenue and the cold rolled copper dormers, finials, crestings and cornices, including the tin and slate roofing, for a building in East Eighty-fourth street.

Labor in South Africa.

The editor of the Johannesburg *Sentinel*, in the Transvaal, publishes the following abstract of the condition of the labor market in that region, which gives anything but encouragement to those contemplating emigration to South Africa:

"Carpenters, no demand; masons, bricklayers and plasterers, no demand; fitters, overstocked; engine drivers, badly overstocked; blacksmiths, no demand; miners, overstocked; house decorators, painters, &c., badly overstocked; printers, badly overstocked; wagon builders, &c., overstocked; tailors, overstocked (owing to colored tailors); bakers, overstocked; shop assistants, badly overstocked; clerks, terrible; dressmakers, overstocked; teachers, poorly paid; good white domestic servants, plenty of room; waiters, overstocked; cab drivers, mostly colored."

The scale of wages, although much above the ruling rates in Europe and America, are, however, counterbalanced by the excessive cost of living. The rent of a three-room cottage is given as from $35 to $40 a month, and good table board at $8 to $10 a week. All food articles, except beef and mutton, cost three or four times their value in England, clothing more than twice as much, and other necessaries of life in proportion.

The ornamental in coal carrying buckets or hods has not been supplied to any notable extent. There is nothing inviting in the average coal hod, but there is no reason why it should continue so ugly that haste is made to get it out of sight as soon as the fire has been replenished. The English have, as a rule, a less objectionable fuel receptacle, and there is good reason for a more attractive arrangement to be designed to perform the functions of the old-fashioned scuttle.

A proposal of the New York Dock Board to utilize the water front of Riverside Park for docks, wharves and elevators was defeated in a meeting called last Saturday to consider the plan.

At the universal exhibition, previously mentioned, to be held in Madrid, Spain, from April 1 to October 31, 1895, the exhibits will not be divided into nationalities, all goods of the same class being shown side by side. The charges for space will vary from $14.50 per square meter (10¾ square feet) to $10. Special positions will be on a higher scale.

THE LETTER BOX.

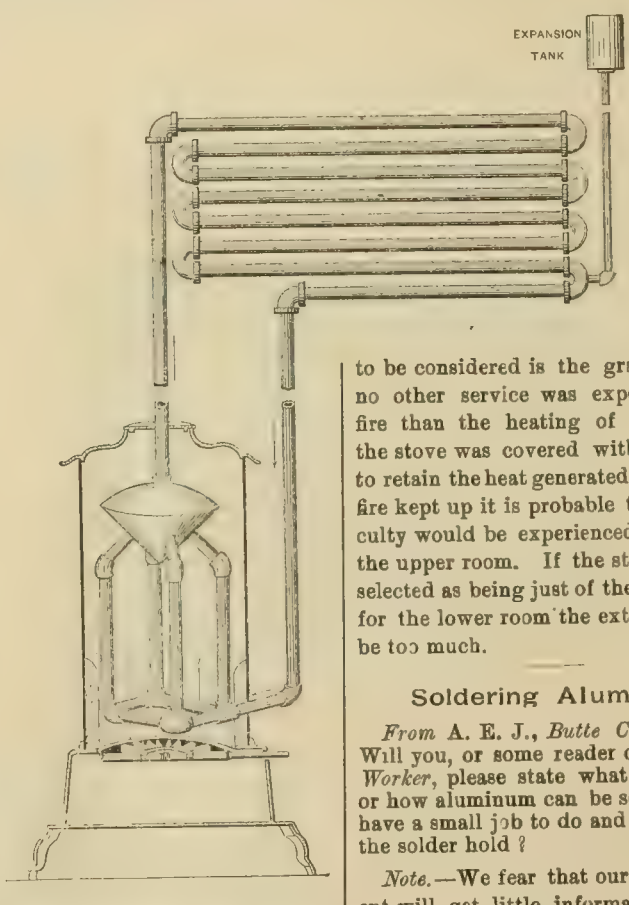
Trouble With a Pump.

From A. C. R., *North Berwick, Maine.*—I would like to ask through *The Metal Worker* what is the matter with an ordinary No. 1 pitcher pump that is connected with 1¼-inch pipe to lift water 22 feet. It will raise half a pail of water, then fail to bring a steady stream, only a little water coming at each stroke until a considerable time has been spent in pumping, when it seems to work well. If it is left for five minutes the same trouble is again experienced, yet I have failed to hear any water running back or to find any leak.

Note.—The action described is the usual result of an air leak that is very small and consequently hard to find. A good plan to follow is to carefully re-leather both the upper and lower valves. See that the upper valve fits the pump barrel tight to take up any wear that may have been made by long service. If this fails to overcome the trouble, the defect that causes it may be found to be a sand hole in the pump casting or a split in the pipe or some fitting.

An Apprentice's Water Heater.

From C. M., *Freston, Md.*—I am an apprentice and wish to surprise my em ployers, but need a little assistance and apply to *The Metal Worker* for informa tion. I have a room on a third floor that I want to heat for a workshop. How many feet of 1¼-inch pipe made into a wall coil would be required to heat by hot water radiation a 20 x 26 x 10 feet room. Also give rule for other sizes of pipe. I want to heat this room from a 13-inch cylinder stove by having four 1¼-inch pipes run down as far as the grate and connect as shown in the illustration and to be connected up above the fire by a hot water dome 10 inches in diameter and 6 inches deep. The stove is shown with the water heater in it, and the radiator and expansion tank.



An Apprentice's Water Heater.

Answer.—To decide correctly the amount of surface necessary to heat a room is not possible without the fullest details as to the character of the building, its exposure, glass surface, &c. Even then the rules require much judgment in their application. Without detailed information the rule of heating from 30 to 50 cubic feet of space with each square foot of heating surface seems to be the only way in this case to approximate the surface. Our correspondent must use his judgment in determining whether the room will be difficult or not to heat. In order to give an answer, 1 square foot of radiating surface will be decided necessary for 40 cubic feet of space, and as the room in question contains 5200 cubic feet it will require 130 square feet of heating surface. The distance the water has to travel will cause it to lose so much heat in transit that it is possible that the water in the coil would not be at a temperature that would enable this amount of surface to prove satisfactory. This contingency must be considered in apportioning the surface and more given if it is deemed necessary. There are 144 square inches in one square foot and the circumference of 1¼-inch pipe is nearly 6 inches. By dividing 144 inches by 6 inches it is found that a piece of 1¼-inch pipe 24 inches or 2 feet long exposes 1 square foot of surface, and by multiplying the 130 feet of surface by 2 the number of lineal feet of pipe necessary to make this coil will be found to be 260. The number of square feet of heating surface that 1 square foot of fire surface in a coil will heat varies from 20 to 30 or more feet with different authorities. Using 25 for an example and allowing for some cooling in the flow and return pipes, there should be 6 square feet of surface in the heating coil. If a coil was used 12 lineal feet of 1¼-inch pipe would be required. A general impression prevails that a coil should be cone shaped and should not come in contact with the coals for durability and highest efficiency, but should be suspended just above them, subject to their radiant heat and the full play of the flame and hot gases. The device of our ambitious young friend is open to some criticism owing to its being partly in the fire and it is just possible that it will lack the necessary heating surface and power. Another important point to be considered is the grate area. If no other service was expected of the fire than the heating of the coil and the stove was covered with a material to retain the heat generated and a steady fire kept up it is probable that no difficulty would be experienced in heating the upper room. If the stove has been selected as being just of the right power for the lower room the extra work will be too much.

Soldering Aluminum.

From A. E. J., *Butte City, Mont.*—Will you, or some reader of *The Metal Worker*, please state what flux to use, or how aluminum can be soldered, as I have a small job to do and cannot make the solder hold?

Note.—We fear that our correspondent will get little information on this topic. A weak point in the working of aluminum at present is the difficulty experienced in soldering. One firm who have done a great deal of work in this line, and manufacture aluminum in various forms, complain of the difficulty of soldering securely. There seems to be little certainty as to whether the solders will hold or not, and in some instances the work has been given up entirely. In Richards' work on aluminum several pages are given to the process of soldering, one of the solders, as recommended by Colonel Frishmuth, for ordinary work being: tin 95 parts and bismuth 5 parts; or tin 97 parts and bismuth 3 parts. And he recommends for fluxes, in either case, either paraffine, stearine, vaseline, copaiva balsam or benzine. A new process, it is

reported, for soldering aluminum by means of chloride of silver, has been invented by O. Nicolai of Weisbaden, and C. Langenbach, Frankfort-on-the-Main, Germany. The chloride of silver, pulverized, molten, or in the form of thin sheets, is placed on the parts to be joined, and the parts are then soldered together by the application of a soldering lamp or blowpipe.

Heating Coil Outside of Fire Pot.

From ROYALLY, *New York.*—In *The Metal Worker* of September 16 I notice an inquiry from "J. R.," Chambersburg, Pa., about a heating coil in a furnace. Some years ago I did the fire-pot coil-winding act and have a record of the date of the performance, as I thought the combination a novelty. The coil and fire pot being large enough, the room not too large, &c., the room may be warmed in this way.

From G. W. M., *Indian Orchard, Mass.*—In your issue for September 16 "J. R.," Chambersburg, Pa., asked about the success of a coil outside a fire pot. I have tried it with the best results, heating two rooms on the north side of the house where, in certain kinds of weather, the hot air could not reach. The cold-air supply does not seem to affect the work of the coil.

Cleaning Foundry Windows.

From IRON FOUNDER, *Chicago.*—Kindly ask through the Letter Box if anybody knows a successful process for cleaning foundry windows.

Note.—This is an interesting question, and as the days grow shorter it will grow in interest. The accumulation on foundry windows which impairs their usefulness is due to the steam from wetting down the sand, the smoke arising from the vents when pouring off, and the dust made in shaking out. The deposit reduces the light, and is not easily removed. A smile has greeted the subject when introduced to some who look upon it as a joke, as foundry windows testify for themselves that they seldom are cleaned. That they might be cleaned with advantage will be conceded, and if our readers have methods of doing it, they would be read with interest by others.

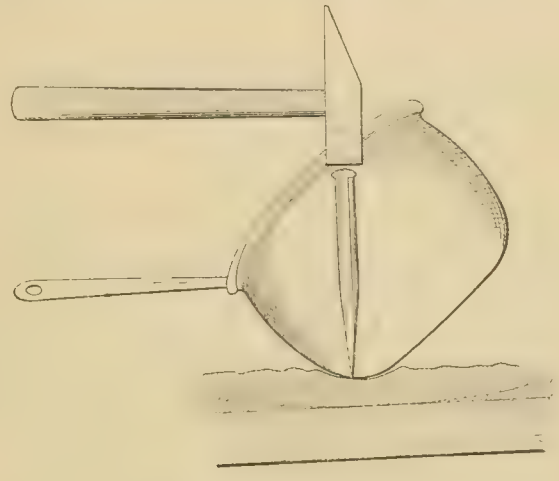
Soldering Flux.

From W. H. P., *Winnipeg.*—Please inform me through *The Metal Worker* the best flux in use for soldering tinware. We are using weak muriatic acid, but it discolors the tin and it takes too much time to brighten it up again.

Answer.—Rosin has always been regarded with favor for clean work, but if something different is desired some of the following may prove more satisfactory. The concentrated soldering flux sold by Paul Thomas, Richard and Delevan streets, Brooklyn, N. Y.; Gedney's soldering fluid, J. F. Farmington, 188 Grand street, New York; Perfection soldering fluid, Baltimore Chemical Company, 78 Gough street, Baltimore, Md., or Yager's soldering salts, Central Stamping Company, Cliff street, New York.

Repairing Tin and Agate Ware.

From E. D. S., *Newman, Col.*—The older readers of *The Metal Worker* may not be as much interested as the cubs in some shop craft I use. I have a way of trimming the bottom of tin coffee pots, kettles, &c., that does away with the old plan of sighting across the article and is more accurate. I first knock the bottom off with the sharp edge of a peining hammer, then with the snips I trim off to where the burr was turned when the article was new. This gives a straight edge to start from, and if necessary to cut off more I mark with dividers set at ¼ inch more or less as required all around the vessel. To put new bottoms on agate ware I cut off the old bottom with a chisel from the inside, as shown by the illustration, then smooth the edges on a stake with a mallet and chip off with the sharp pein of the hammer enough enamel to make room for the burr. The burring machine will chip off enough more so that it can be soldered on the inside with ease, using cut muriatic acid.



Repairing Tin and Agate Ware.

Gas Tar for Roof Paint.

From E. E. P., *New Haven, Conn.*—I noticed in *The Metal Worker* of September 16 a communication from "S. & H.," asking whether or not gas tar was a good preservative of sheet-metal roofs. In answer to the question it is denied that, as a preservative of tin, it could be recommended. I inclose a sample of tin which was taken from the hip of a slate roof on an engine house that was new two years ago last January, which speaks for itself. The tin is eaten away by the gases from the locomotives on the under side, leaving the top side of the tin bright. This was protected, as you will see from the sample, by coal tar. Thinking you might be interested in this experience and sample, as well as your readers, I have sent it in.

Note.—The tin has completely gone from the under side of the sample received, while a thick covering of tar is on the top side; but wherever the tar is scraped off the tin is in good condition, showing, as we stated in the answer quoted, that the use of gas tar is not always attended with bad results, though the general experience of those who have tried it has not been of a character that would encourage its general use.

Squaring a Circle.

From C. S. H., *Marblehead, Mass.*—Will you please give in *The Metal Worker* a rule for squaring a circle?

Answer.—A few years ago this question was answered in *The Metal Worker*, and as the conditions have not changed and are not likely to change, the same answer applies. We presume that our correspondent is aware that an exact method for squaring a circle has never been discovered, although mathematicians have been at work upon the problem for at least 2000 years. As commonly understood, however, squaring a circle means obtaining the approximate area of a circle whose diameter is known. Without going deeply into the mathematics of the problem, we think we can answer our correspondent satisfactorily by giving two simple methods of squaring the circle. The first is to multiply the square of the diameter, or in other words, the product of the diameter multiplied by itself, by 0.7854. This is a very accurate method, but another one that in some cases would be easier is to multiply the square of the diameter by the fraction $\frac{11}{14}$. To make use of a practical example to show the slight difference between these two methods we will assume that we want to obtain the area of a circle 10 inches in diameter. According to the first rule the area would be equal to $10 \times 10 \times 0.7854 = 78.54$ inches. By the other method it would be $10 \times 10 \times \frac{11}{14} = \frac{1100}{14} = 78.57$. The difference between the answers obtained by these two methods is only 0.03 square inch.

The Jamaica (W. I.) sugar crop is reported to be threatened with destruction by a new and baffling disease which has attacked the canes. Specimens of canes so diseased have been sent to Europe for examination of experts.

THE TIN SHOP.

Pattern for Elbow, Elliptical to Round.

From E. S., *New York.*—The following method for obtaining the pattern of a two-piece elbow, one end of which is elliptical and the other round, is presented to the readers of *The Metal Worker* for their consideration. In venient manner, the width L′ *c*′ being known. To obtain the width L′ *c*′ proceed as shown in Fig. 1. From K, on K F, set off the distance J E, as indicated by K *m*. Bisect F *m* in *n*, and take K *n* as the width L′ *c* in Fig. 2. The shape G′ L H′ having been established, divide it into any convenient number of equal parts, and from the

For convenience of designating these sections, which are shown in Figs. 3 and 4, they are lettered to conform with the large letters on section lines in A′ G′ H′ D′, which for convenience we will consider to be the plan. To construct section P draw the line *f*′ *a*′, in length equal to *f a* of plan, and from point *f* of section erect a perpendicular in length

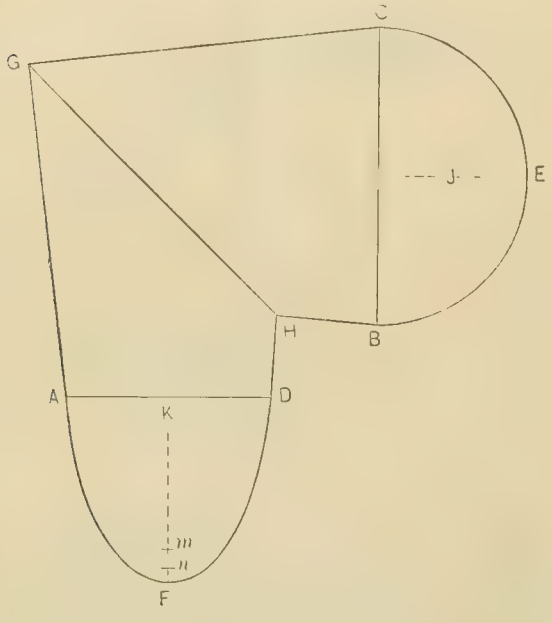


Fig. 1.—Elevation of Elbow and Half Profiles.

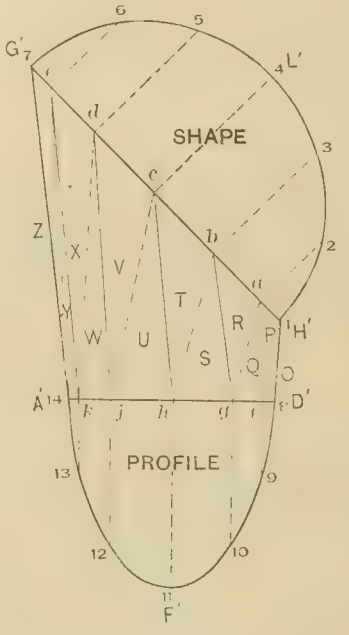

Fig. 2.—Divisions Drawn for Sections.

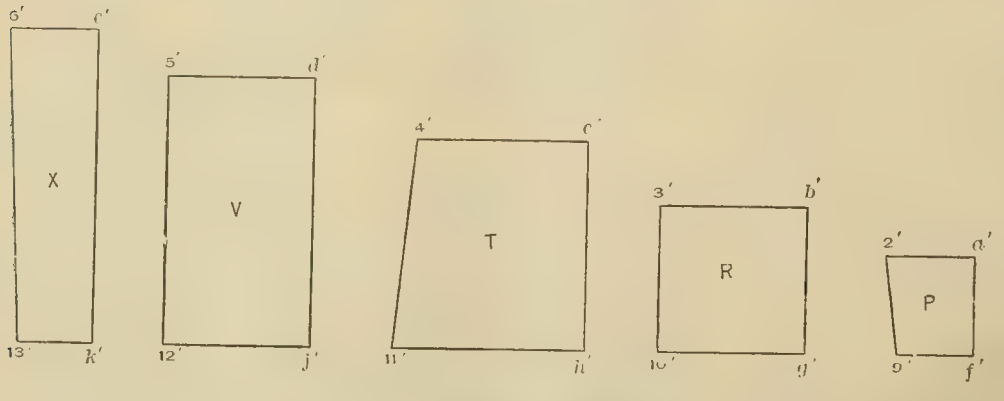

Fig. 3.—Sections Represented by Solid Lines, Fig. 2.

PATTERN FOR ELBOW, ELLIPTICAL TO ROUND.

Fig. 1, let A G C B H D represent the elevation of elbow, A F D the half profile of elliptical end and C E B the half profile of round end. In Fig. 2 A′ G′ H′ D′ F′ is a duplicate of part having similar letters in Fig. 1. The pattern A′ G′ H′ D′ will be obtained by the use of sections.

The first step will be to decide regarding the shape on miter line G′ H′. In the present instance an ellipse has been selected, as indicated by G′ L′ H′. This figure can be drawn in any con- points thus obtained drop perpendiculars cutting G′ H′, as shown. Also divide A′ F′ D′ into the same number of parts, and from the points thus obtained drop perpendiculars cutting A′ D′. Connect the points in A′ D′ with those in G′ H,′ as indicated by the solid and dotted lines. We will suppose that G′ L′ H′ and A′ F′ D′ were bent up at right angles to A′ G′ H′ D′. Our purpose is to construct sections that will give the distance between points in A′ F′ D′ and G′ L′ H′.

equal to *f* 9 of profile. From point *a* of section erect the perpendicular *a*′ 2′, in length equal to *a* 2 of shape H′ L′ G′. Connect 9′ 2′ of section. As previously stated, we will suppose that G′ L′ H′ and A′ F′ D′ were bent up at right angles to A′ G′ H′ D′. If section P was placed upright on plan with *f*′ *a*′ on *f a*, 9′ 2′ of section would give the distance between points 9 and 2. Regarding section R, *g*′ *b*′ of section is derived from *g b* of plan, *g*′ 10′ of section from *g* 10 of profile, &c. The distance 10′ 3′

of section represents the distance between points 10 and 3 in Fig. 3, when the article is formed as previously described. The other sections are obtained in a similar manner.

The sections represented by dotted lines in plan are shown in Fig. 4. To construct section O, proceed as follows: Draw the line f' 1′, in length equal to f 1 of plan. From f' erect the perpendicular f' 9′, in length equal to f 9 of profile. Connect 9′ 1′. With the article formed as previously described, 9′ 1′ of section gives the distance from 9 of profile to point 1 of plan. To construct section Q, draw the line g' a', in length equal to g a of plan, and from point a erect the perpendicular a' 2′, in length equal to a 2 of shape G′ L′ H′. From point g' of section erect the perpendicular g' 10′, in length equal to g 10 of profile A′ F′ D′. Connect 10′ 2′. With the article formed as previously mentioned, 10′ 2′ of section Q gives the distance between points 10 and 2. The other sections can be obtained by following the same method, as indicated by the letters and figures.

In Fig. 5, G1 H1 D1 A1 is the pattern of part of article shown in Fig. 2. G1 H1 of pattern is the stretchout of shape G′ L′ H′, and A1 D1 of pattern is the stretchout of A′ F′ D′. The distances represented by solid lines in pattern are obtained from the sides of sections in Fig. 3, as indicated by corresponding figures, and the distances represented by dotted lines in pattern are obtained in a similar manner from the sections in Fig. 4. Then to obtain the part of pattern shown in Fig. 5 by G1 H1 D1 A1, proceed as follows: At any convenient place draw the straight line H1 D1, in length equal to H′ D′ of plan. From H1 of pattern as center, with radius 1′ 9′ of section O, describe an arc, which intersect by a second arc struck from D1 of pattern as center, with radius D′ 9 of profile, thus establishing the point 9 of pattern. Then with radius H′ 2 of shape, from H1 of pattern as center, describe an arc, which cut with another arc struck from point 9 of pattern as center, and 9′ 2′ of section P as radius, thus establishing point 2 of pattern. With point 2 of pattern as center, and 2′ 10′ of section Q as radius, describe an arc, which intersect with another arc struck from point 9 of pattern as center, and 9 10 of profile as radius, thus establishing point 10 of pattern. With point 10 of pattern as center, and 10′ 3′ of section R as radius, describe a small arc, which intersect with one struck from point 2 of pattern as center, and 2 3 of shape as radius, thus establishing point 3 of pattern. Continue this process, locating in turn the remaining points in pattern, as shown. Lines drawn through the points thus obtained, as indicated by G1 H1 D1 A1, will be one-half of the required pattern. The other half, as shown by G1 H2 D2 A1, can be obtained in a similar manner, or by a repetition of the above process. The pattern for the other part of elbow, as shown in Fig. 1 by G C B H, can be obtained by the same method. The shape G′ L′ H′ is to be drawn to the left of the miter line G H, and the operation continued, using the same process, as shown in Figs. 3, 4 and 5.

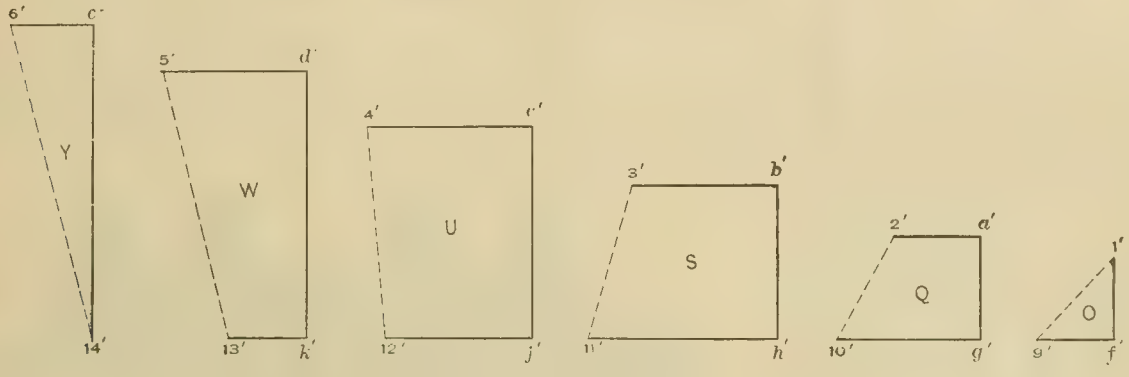

Fig. 4.—Sections Represented by Dotted Lines, Fig. 3.

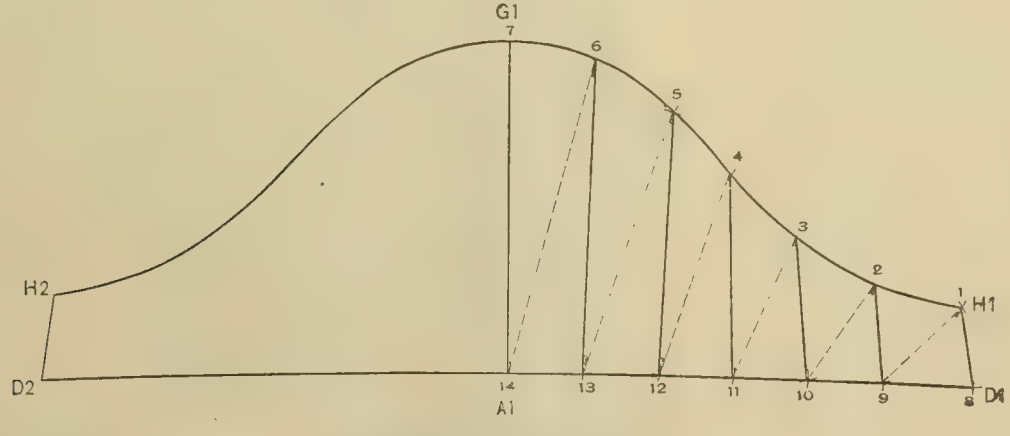

Fig. 5.—The Pattern Shape.

PATTERN FOR ELBOW, ELLIPTICAL TO ROUND.

Tin Mining in Tenasserim.

The tin bearing area in Tenasserim, Lower Burma, which during the last two years has been carefully surveyed by experts under the East Indian Government Geological Department, has been handed over under a concession to a Captain Menzell, who, says the *Indian Engineer*, has succeeded in organizing a powerful company in England to work the mines, with a guaranteed capital of about $10,000,000. If expectations in Tenasserim are realized, Lower Burma may become an important rival to the Straits. One or two previous attempts to exploit Tenasserim tin have failed owing to want of the precise information now supplied by the Geological Department, as well as to the ignorance of promoters of the methods of obtaining and utilizing Chinese labor, to which progress in Straits tin mining is mainly due. Captain Menzell is in these matters a thorough expert. His life has been spent in the Straits and in the neighboring colonies, and he has met with signal success in importing both Chinese and Indian labor to the British and Dutch possessions.

J. Warren Coulston of 505 Chestnut street has published a pamphlet descriptive of and setting forth the advantages of the Edward C. Broadwell process for coating iron and other metals with aluminum and its alloys by dipping and without the use of electricity. After cleaning the article he treats it with a flux containing a haloid salt of tin or of tin and zinc. Then he dips it in aluminum or an alloy. This substitute for tin has been called "aluron."

STEAM AND HOT WATER.

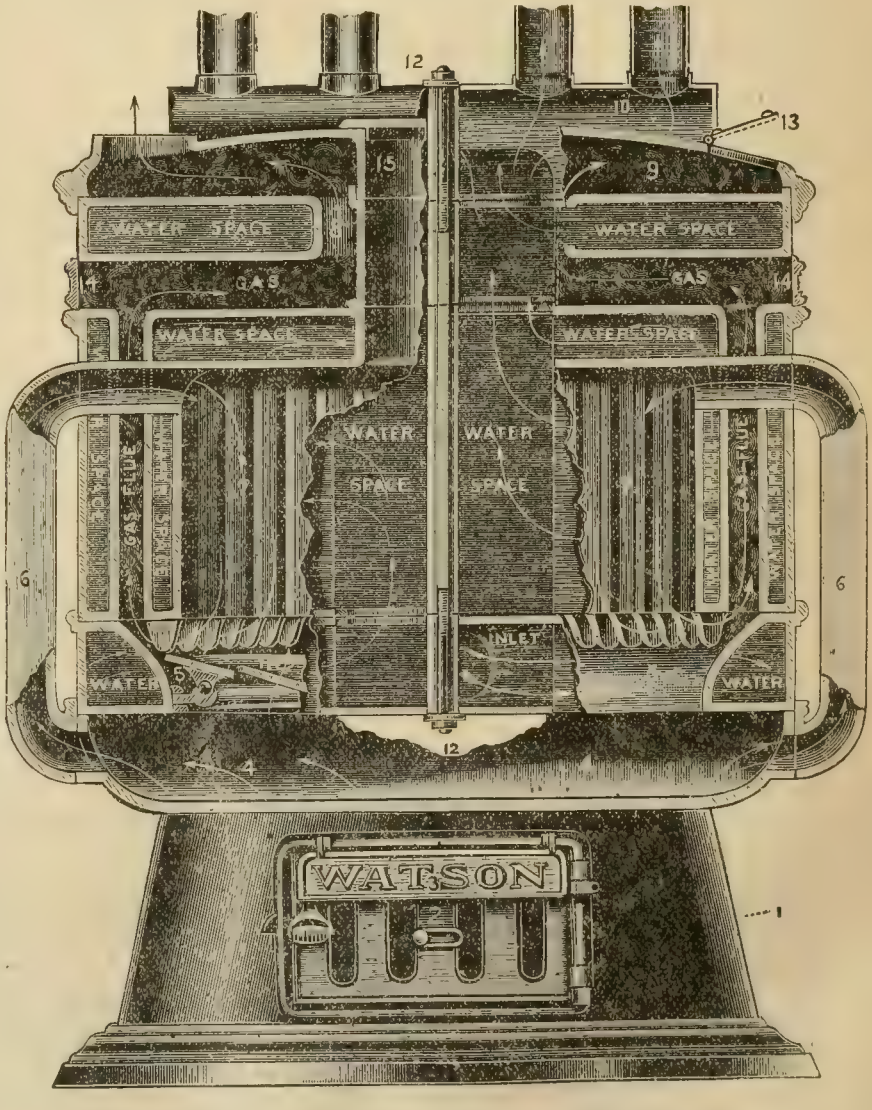
John Simmons Company's Catalogue.

We have just received illustrated catalogue No. 5 from the John Simmons Company, 106–110 Centre street, New York. It is a book of over 500 pages, 9 x 12 in size, bound in brown cloth, with the company's name in gilt letters on the front cover and the back. Record is kept of the disposition of the catalogues, as a paster inside the front cover says: "This book is registered No. 769." The title page gives a general enumeration of the line of goods they handle as wrought, cast iron and steel pipes, boiler tubes, fittings and brass work, tools and supplies for steam, water, gas, oil and electrical engineering. On another page, in an address "To our friends and patrons," they say that to the best of their ability they have endeavored to illustrate as many as possible of the articles used in the above trades. The catalogue divides the line of goods into seven classes, and an index in the back enables any desired article to be readily found. The first class devotes 48 pages to "Pipe and Fittings." Among the new things are the Netherland pipe hanger and a patent pipe coupler, by means of which a piece of pipe can be taken out of a system and replaced without disturbing any other parts. Class second devotes 78 pages to "Iron Body and Brass Valves, Cocks, &c.," for regulating pressure, to prevent vacuum, back pressure and for safety, with a plentiful use of sectional views showing the constructions. Class third devotes 100 pages to "Miscellaneous Brass Goods," including many forms of bibbs and cocks, air valves, steam whistles, water gauges, oil cups, gas fixture fittings and gas stoves. Class fourth occupies 50 pages in illustrating "Steam Heating and Fitting Specialties," including horizontal and vertical tube power boilers, a great variety of steam and hot water heating boilers, radiators, both direct and indirect, pipe coils, registers, steam separators, injectors, governors, indicators and other standard goods. Class fifth devotes 150 pages to "Plumbers' Brass Goods, Cast Iron Soil Pipe and Fittings, Earthen Ware, &c." Four special inset pages show round, oval and square lavatories on a buff enameled paper in six colors and gilt. As is indicated by the space given, an exhaustive line of plumbers' supplies is made a feature of the business of the house. Class sixth gives 50 pages to "Pipe Cutting and Threading Machines and Tools," and the line leaves little to be desired by the steam fitter, plumber or gas fitter. Class seventh takes 60 pages to show "Street Washers, Hydrants, Pumps, Hose Goods, Packings and Supplies."

With the catalogue comes a price-list of 350 pages in a flexible cloth cover, with the name in gilt and bound so the book will lay open at any page without the use of weights. One page is devoted to an announcement that the prices conform as near as possible to the standard lists. Then their terms, with another page giving their pipe cypher code and some instructions for orders by telegraph. At the back is an index, by the aid of which the price of any desired article can be readily found. Both the catalogue and the price-list give evidence that no little labor has been spent in arranging them to be of the greatest benefit to their patrons, and the publications will prove valuable additions to trade literature.

The Watson Perfect Combustion Heater.

In Annex D of the boiler room extension, Machinery Hall, at the World's Fair in Chicago, a hot water boiler is shown in operation, which is attracting much attention from experts. It is exhibited by the Watson Perfect Combustion Company of 53 Lombard street, Toronto, Canada. There are a number of very interesting points in the construction of this boiler, but the special feature is the principle of combustion. While the effective application of the heat to the body of water contained, and the rapid circulation of the water, are subjects which have received careful study and scientific treatment, yet above these has been placed the necessity of securing as perfect combustion of fuel as possible. The heater is so constructed that either anthracite or bituminous coal can be used. It is specially adapted, however, to the use of bituminous or soft coal. For this purpose it is constructed on the down draft principle. Fuel is fed in a magazine at the top. There is no feed door in front for supplying fuel in the usual way and thus admitting a blast of air to check the fire and permit smoke and smudge to escape. The construction will be more easily understood by an examination of the accompanying cut, which gives a sectional view of the heater.



The Watson Perfect Combustion Heater.

The object of the peculiar method of construction shown in this illustration is to heat the fuel before it reaches the fire and also to heat the air admitted above the fuel, in this way thoroughly mixing the gases liberated from the fuel with the heated oxygen and drawing

them downward through the heated body of fuel on the grate surface. In this way, it is pointed out, the heated body of fuel on the grate surface is always supplied with sufficient oxygen through the grate surface to support combustion, all gases liberated from the fuel being burned. The air for draft not being admitted in a compact body, but in small jets and highly heated, there is an intimate mixture of the particles of carbon in the fuel and the oxygen of the air, causing a gaseous flame with no perceptible smoke. The heater, as shown in operation at the exposition, is run on soft coal with apparently as little attention as is ordinarily given to hard coal fires. The manufacturers state that when the magazine is filled with soft coal no further attention is required for at least 24 hours, a uniform temperature being maintained during that period. In the circulation of the water care has been taken to avoid conflicting currents. The hottest section is just above the level of the grate. The water section is so constructed that any number of them can be fitted together to secure greater capacity.

The principle upon which the com bustion chamber of this heater is built is adapted to other purposes, as, for instance, the construction of hot-air furnaces or steam boilers for operating stationary or marine engines, and thus enabling soft coal to be used as fuel without the resultant nuisances of frequent feeding, stirring fires and making clouds of smoke and deposits of soot. Arrangements are being made for the manufacture of this apparatus in the United States, probably at Chicago.

The Monitor Steam Generator Mfg. Company

of Landisville, Pa., and 49 North Seventh street, Philadelphia, have just issued a 64 page catalogue, in handy form, descriptive of the Monitor instantaneous steam generators and Positive hot water circulators for heating dwellings and other buildings, and high pressure boilers for power purposes. The opening pages describe the generator as being composed of an outside water leg or double shell, made of boiler iron or steel, the inside fitted with one or more wrought iron worms or coils, which are connected to the water leg at both ends by nipples expanded into the shell. The shell is surmounted by a dome of cast iron, with neck for pipe, in which is placed a damper, a coal shute and cover, and small damper lid. The dome is secured to the shell by two studs and nuts, so as to be easily removed when required. A magazine is connected to the coal shute and is covered by a cast iron lid, which forces the fire and combustible gases to circulate through every part of the coils and produces, it is claimed, a perfect combustion, the different coils and spaces between them being so arranged that the heat reaches every part of their surface with almost equal intensity, thus reducing the expansion and contraction to a minimum. The lid or cover to the magazine can be raised by a handle at the back of the dome to receive coal and then be left to drop into place. The base is made of cast iron with a grate of the crusher type having three to five bars, which are worked with a lever at the right side. The long ends of the bars are extended through a plate bolted to the side of the base, and any or all of the bars can be taken out without removing the boiler. The ends of the bars are connected with a cross bar and operated with a lever. The base is also provided with a draft door and register. When in operation the generator is regulated by an automatic damper regulator. The hot water circulator resembles the steam generator, but has only a single shell and the coil surface is increased. The coils are connected to a manifold at the top, from which the mains are taken, and to a water leg at the bottom into which the returns discharge. In operation it is claimed that the heat, being most intense around the coil, starts the water into rapid circulation, and that, owing to the great velocity with which water is forced through the parts, incrustation of the shell or coils is impossible.

The high pressure boiler is described as possessing the same principle as the generator, but as being built with a view to having more water and steam space. There is a quantity of valuable information on the subject of heating contained in the catalogue, as well as tables, rules, forms of specification and contracts, price-lists of pipe and fittings, and 15 pages of testimonials. The catalogue is well illustrated and printed, and appears in imitation leather covers.

HEATING NOTES.

Thomas W. Weathered's Sons, at 244 Canal street, New York, report an active business in hot water heating goods, both for residence and horticultural work.

Jacob Reigner, Pottstown, Pa., makes a specialty of the Gorton boiler, made by the Gorton & Lidgerwood Company of New York.

One of the attractions at the Armstrong Mfg. Company, 252 Canal street, New York, is the pipe threading and cutting off machine, which handles pipe from 1 to 4 inches in diameter. The regular dies used in the hand tools for No. 3 are used in the machine for 1 and 2 inch pipe and No. 6 dies for 2½ to 4 inch. The machine has both a centering and gripping chuck and is made for either hand or power use. This machine is in lively demand among the steam and hot water fitting trade at the present time.

Chas. Yingling, a popular representative of the Nason Mfg. Company, 71 Beekman street, New York, stamps himself on the memory of his friends with an aluminum medal carrying a bust of Columbus and the dates 1492 and 1893 on one side. On the other is a bas-relief of a boiler with the wording, "High Duty Heaters. 10 to 1 Efficiency. Equator for Steam, Gulf Stream for Hot Water," and the address of the house.

The Gorton boilers, made by the Gorton & Lidgerwood Company of New York, will be run in Burlington, N. J., by Richard Hepworth, who makes a specialty of plumbing, steam and gas fitting.

A novelty in the way of a regulating device is the Mason vacuum valve, recently manufactured by the Mason Regulator Company of Boston for a large Canadian sugar refinery, which has now several in use. It is to the regulation of a vacuum what a reducing valve is to steam pressure, for by placing one of these valves in the exhaust pipe leading to the vacuum pump, any desired amount of vacuum may be kept in the chamber by simply adjusting the valve. It is especially desirable where different degrees of vacuum are desired in each one of a series of chambers, as in the triple effect process of sugar refining, and other processes where a certain vacuum is desirable.

H. B. Smith Company, 133-137 Centre street, New York, find the trade lively in heating apparatus, equally divided between steam and hot water. Some of their more important contracts at the present time are for installing indirect hot water heating plants.

Dewstoe & Schneider, 290 Seneca street, Cleveland, Ohio, issue catalogues respecting the Richmond heaters for steam and hot water, which they handle and sell. The frontispiece is a view of a pleasant-looking country house, beneath which is a wise sentence from that fountain of wisdom, Benjamin Franklin. It is: "A comfortable home helps to moral character and good citizenship." Of course the inference from this is that the Richmond heaters will contribute much to make the home comfortable. Those who are interested in the apparatus will find full descriptions in the pages which follow, and at the end are numerous testimonials and references from those who have used the heaters in Cleveland and other parts of Ohio.

The trade in radiators of the American Radiator Company, 92 Centre street, New York, is not confined to the United States alone, some considerable shipments having been made to European countries during the past season. At the present time proper attention to their general mail orders necessitates some night work.

The catalogue of the John Simmons Company, 108 and 110 Centre street, New York, reviewed at length in our Plumbing department, is a book that would be valuable to the heating tradesman.

Percival H. Seward, engineer at the New York office of the American Boiler Company, has recently returned from a trip to England. While there he visited some of the more prominent hot water heating houses, and discourses very pleasantly on the condition of affairs as he found them. He is of the opinion that the average hot water job in the United States presents a more attractive appearance than those installed in England.

The Penn Engineering Company is the title of a new concern commencing business at 312 Cherry street, Philadelphia. The company are prepared to undertake steam and hot water heating and ventilating. They also announce that they will prepare plans and specifications for the installation of power, heat, ventilation and light in all classes of buildings and superintend installations. Manuel J. Hanna, lately with the Onderdonk Heating & Ventilating Company, is engineer of the company and George W. Sickels is secretary.

Alex. B. Johnston, New York manager for Raymond & Campbell Mfg. Company, Middletown, Pa., informs us that his sales so far this year are more than double what they were a year ago. He also carries in stock a full line of repairs of the National Stove Company and the New York Stove Works.

The American Radiator Company, 111 and 113 Lake street, Chicago, are distributing as souvenirs of the World's Fair beautifully illustrated pamphlets entitled, "The Story of Columbus." The illustrations are taken from the 12 original life size oil paintings by the eminent Italian artist, Gregori, in the possession of Notre Dame University, at Notre Dame, Ind.

WORLD'S FAIR NOTES.

The Norton Emery Wheel Company

of Worcester, Mass., show at Column E 53, Machinery Hall, what they claim is the largest and most complete assortment of emery wheels ever shown in an exhibit. It is estimated that there are 50,000 wheels in the exhibit, from $\frac{1}{8}$ inch to 36 inches in diameter, and $\frac{1}{32}$ inch to 6 inches thick, of every conceivable shape and for every purpose. They also make a fine display of grinding machinery in operation. The Worcester twist drill grinder is shown in three sizes. Their Walker universal cutter and tool grinder will grind all kinds of cutters and mills, reamers, twist drills, taps, lathe and planer tools, and in fact every tool known in the machinery business easily and practically. External and internal grinding and surface grinding on cup wheel can also be done. A novel feature is that each wheel furnished with this machine, of which there are 18, in all different shapes, is mounted on an iron collet, which is drawn into a taper protecting spindle that insures the wheels' runperfectly true, however often it is changed. There is absolutely no chance for emery to get to the spindle or any of the bearings. The machine is really universal without being complicated and difficult to operate. In connection with the grinder is a friction countershaft which has five changes of speed. A speed of 20,000 turns per minute can be obtained for small interval grinding. It is claimed for the new Norton elastic wheel that it is superior for saws, cuts free, wears well, and will not case harden. These wheels are in regular daily use in the sawmill exhibit. In the arrangement of the display a great deal of ingenuity is shown. Ornamental columns made of emery wheels laid flat on one another form posts for the pavilion. On a show board in the rear are fastened numerous specimens of unmounted wheels. Ornamentation has been secured in notable instances by putting together two or more wheels of different sizes. A cornice of this character runs across the top of the show board. The small wheels are shown in cases. M. B. Hill is in charge of the exhibit.

Crane Company

of Chicago make a very fine display of malleable and cast iron fittings, brass and iron valves and cocks and other articles in the steam and gas fitting line at Column O 28, Machinery Hall. Much ingenuity is shown in the arrangement of this exhibit, which is exceedingly attractive, A number of tall composite columns have been erected, composed in some cases of valves, tapering from large sizes at the base to very small sizes at the top. In other cases fittings have been coupled together, their curves forming graceful outlines, such columns also tapering from large ones at the base to small ones at the top. The space is of liberal dimensions, nevertheless but a small portion of the company's products can be shown, as they manufacture over 7000 articles of this description. The exhibit comprises brass globe and angle valves in a great number of sizes and styles, brass gate valves, brass cross and check valves, brass hose valves, brass butterfly and throttle valves, brass safety valves, brass radiator valves, brass steam cocks, brass gas cocks, brass union elbows, brass expansion joints, brass pump valves, hose nozzles, hose couplings, hose clamps, corporation cocks, brass elbows, tees and crosses, engine trimmings of every character, including whistles, iron cocks for steam, gas and water, iron body globe and angle valves, iron body cross valves, iron body check valves, iron body safety valves, back pressure valves, iron body butterfly and throttle valves, foot valves, iron body expansion joints, iron body gate valves, cast iron fittings, cast iron flange fittings, malleable iron fittings, &c. There has been an enormous growth in the varieties and sizes of goods of this character caused by the complications of the business, which have sprung up within a comparatively few years, and the Crane Company have made special efforts to keep pace with the progress of the trade. They are large manufacturers of wrought pipe and have their own iron and brass foundries, so that they possess peculiar advantages to meet the requirements of the business. The company also make an exhibit of their own automatic air brake in the Transportation Building.

The Abendroth & Root Mfg. Company

of New York make an exhibit at M 28, Machinery Hall, of Root's spiral riveted pipe in 25-foot lengths and varying from 3 to 16 inches in diameter. These pipes are galvanized, coated with coal tar and asphalt, also plain black, as the purchaser may desire or the usage to which they are to be placed requires. The spiral seam is the strongest portion of the pipe, as has been proven in numerous experiments. This pipe is adaptable for water works use, distributing water mains and hydraulic mining. An advantage of this pipe is the ease with which it can be handled and transported, rendering it remarkably convenient for use in localities difficult of access or where skilled labor is scarce. A handsome lithograph of the Root water tube boiler as used in the great boiler house of the exposition is also seen here, encouraging the sightseer to investigate further.

Sedgwick Bros.

of Richmond, Ind., have erected an extremely attractive pavilion in the north end of the Horticultural Building at the World's Fair. It is composed of wrought-iron pipe, with an arched roof, poultry netting being fastened to the sides and top, round which vines are trained. Their exhibit of wire netting and fencing is extensive and well arranged. In one instance a huge column composed of rolls of netting has been erected, the column containing 5760 feet of netting. A very large roll is shown which weighs 660 pounds and is 560 rods long. Scattered about the inclosure, which is fenced with Sedgwick fencing, are lawn settees and chairs made of wrought-iron pipe, with seats and backs of netting. They are galvanized, and are not only comfortable, but are capable of resisting the action of the elements indefinitely.

Charles H. Besly & Co.

of Chicago make an interesting exhibit at Column I 49, Machinery Hall, of a number of specialties which they manufacture. Of these the Gardner grinder is the most prominent. It is a new tool, having but recently been brought out. It is designed primarily for grinding perfectly square surfaces. A steel disk, $\frac{1}{2}$ inch or more in thickness, has both sides grooved in concentric rings. Emery cloth or emery paper is then pasted to the sides, under heavy pressure, which forces the material into the grooves and causes it to adhere closely. The disks are then mounted on suitable frames in pairs, one at each end of a short shaft. A rest for the article to be ground is fixed in front of the side of the disk, and is accurately adjusted, so as to hold the article perfectly square. Two persons can thus work at one grinder. When one face of a disk is worn it is reversed, and after both sides are worn the disk is easily recovered. Rests of different patterns are provided for special work, as, for instance, for grinding pulley faces. Numerous specimens are exhibited of the work done on these machines. Besly's parallel clamps, now familiar to most machinists, are shown in great variety. Other articles exhibited are Gardner's adjustable stock and dies, Perfection oil cups and Helmet oil.

The Buckeye Iron and Brass Works

of Dayton, Ohio, make a very large exhibit of fittings and other brass work at Column K 44, Machinery Hall. In finely arranged cases they show a great variety of handsome specimens of finished brass goods for special purposes. On a large platform are erected high columns of brass valves, tapering from huge sizes at the bottom to very small ones at the top. In addition to this display of finished products, the company exhibit machine tools of their own design which have some interesting features. One is a milling machine for milling squares or hexagons on valves, &c., which uses as many cutters as there are sides to be milled, all of which work simultaneously. Another machine is a forming lathe, with a vertical slide and an automatic feed. The latter consists of a feed rod running along the back of the machine, which drives a worm that moves the slide by means of bevel gears and a vertical shaft. The forming tool is adjusted easily and simply to suit the character of the work to be done. The forming tool slide has in its face a circular recess, having dovetails at the top and bottom which correspond with dovetails at the top and bottom of an adjustable block. The block, being inclined as desired, is held in position by a vertical clamping bolt.

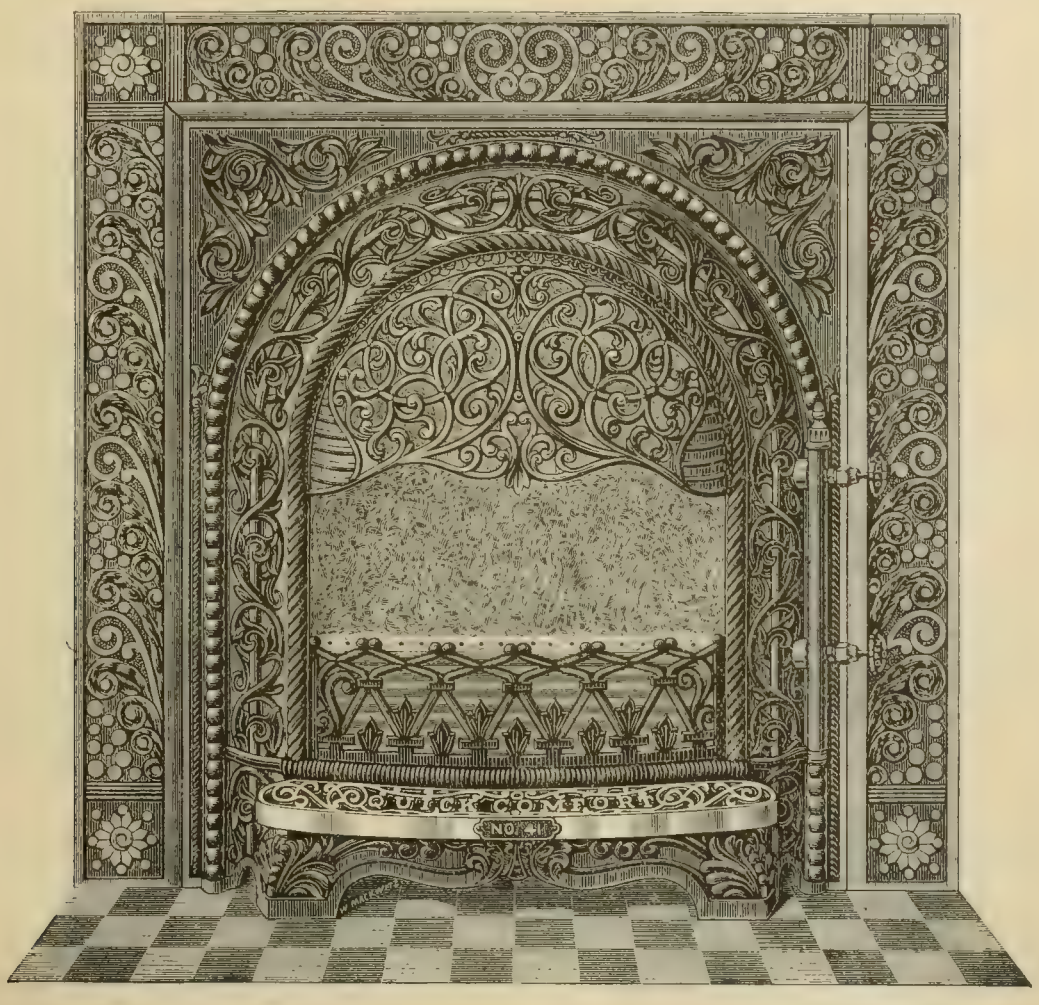
The Flint & Walling Mfg. Company

of Kendallville, Ind., have two exhibits, one at Column J 35, in Machinery Hall, and the other in the wind mill district outside. At the first-named location their well-known Hoosier lift and force pump is shown, adaptable to wind or hand use. Spray pumps and various other descriptions are also shown, while the feature which attracts most attention is undoubtedly an 8-foot mill on which the arms of the wheel are alternately finished in copper and brass while the casings are handsomely nickel plated. This wheel revolves and forms a part of the miniature water works for use in residences which is shown. Over in the wind mill section their Star mill proves worthy of its name. It has a direct stroke and is back geared, is simple in construction and perfectly self-governing, the crank movement doing away with side draft. These wheels are made from 8 feet to 26 inches in diameter.

Among new corporations chartered in Albany, N. Y., on September 28, was the Sheet Metal Works of Brooklyn, N. Y., a company formed with $10,000 capital for the manufacture and sale of metal goods. The directors are J. Fred. Pierson, Henry J. Pierson and William B. Ellison, all of New York.

Quick Comfort Fire Place Gas Grate

The Ringen Stove Company of 414 North Broadway, St. Louis, Mo., have added to their assortment of heating stoves a new line of constructions intended for burning gas as a fuel. These heaters are known under the name Quick Comfort and are so made as to present the appearance of bright, cheerful open fires. They are made in three sizes to fit any dimension of opening in the chimney breast. The front view of one size of the Quick Comfort fire place gas grate is shown in the accompanying illustration. The finish is in black japan with full nickel trimmings, although old copper in combination with ornamental tiles is supplied when so ordered. The flames impinge upon the asbestos covered reflector in such a way as to render the asbestos incandescent immediately upon lighting the burners. The grate is fitted with an adjustable damper which allows the gases to pass to the chimney flue. In this grate, the manufacturers state, coal gas, fuel gas, water gas, oil gas or natural gas may be employed. The company have just issued a little pamphlet illustrating and describing their new lines of gas heaters, which are made in several varieties. They also offer to the trade a six-flue radiator, the flues being made of Russia iron and the trimmings of nickel, with polished copper reflector so placed as to show the burners through the perforated base.



Quick Comfort Fire Place Gas Grate.

Cooking Schools.

The London *Gas World* says: "Within the last ten years the development of gas cookery has been very extraordinary. Exhibitions of gas appliances have been held all over the country by gas stove manufacturers, combined with free cookery lectures; and public opinion has been largely educated by these means. One aspect of the question is worthy of notice. We must all be conscious of the immense strides that have been made during the present generation in familiarizing the art of cookery in our country. After years of astonishing neglect, our education department at last awoke to the fact that cookery ought to form part of every woman's education; and during recent years county councils have also expended large sums on this important department of education. Schools of cookery have arisen in all the leading centers; and our board schools are now equipped with the necessary apparatus for teaching this important branch of domestic economy. It can scarcely have escaped the notice of observant spectators that this vital, but quiet, social revolution could not have attained its present dimensions but for the fortuitous circumstance of a new and much improved method of cooking —the introduction of the gas oven."

The course pursued by the English in giving lectures has not been followed in the United States, but might with as wide a benefit. The lectures there dealt less with the luxurious cooking as taught by the few who have discoursed on the subject here. With the desire to introduce their stoves among those with meager incomes, the information given did not forget the purse in pleasing the palate. Effort was made to teach a method of preparing the food provided to much better advantage than the method prevailing among the listeners, and also to select the food with the same end in view. Invariably the lecturers have been young women who have specially prepared for the work and received good remuneration. The example has not been without its effect even here, as may be appreciated by some attempt being made to teach cooking in some of our schools; but that it could be more widely followed and brought nearer to every home with advantage is not to be questioned.

L. Simonoff, a German inventor, has patented a series of test sheets for studying the amount of illumination of a hall or other large room, at different points. The test sheets are printed in black type on sheets which are successively darker in hue, from pure white to dark gray. It is found that for any particular brightness of illumination there is always one sheet that can be read, while the next one cannot be read. If the observer be a little color blind, the type can be obtained in modified colors so as to suit the case.

TIN PLATES.

The Tin Plate Report.

The following is a comprehensive synopsis of the quarterly report of Col. Ira Ayer, Special Agent to the Secretary of the Treasury, to which we made reference last week. He says:

During the quarter ended June 30, 1893, 35 firms manufactured 39,543,587 pounds of tin and terne plates proper, against an output of 29,566,399 pounds by 33 firms during the previous quarter.

The amount of American sheet iron and steel made into articles and wares tinned or terne plated was 2,322,455 pounds, making aggregate output for quarter 41,866,042 pounds; of the tin and terne plates proper 18,264,225 pounds, or more than 46 per cent., and of the aggregate 20,586,680 pounds, or more than 49 per cent., were made of American black plates.

The total consumption of American plates during the present quarter, including products from American sheet iron and steel terne, was 14,102,299 pounds, showing an increased consumption of American plates during the last, as compared with the previous quarter, of 6,484,381 pounds, or an increase of about 46 per cent.

Of the commercial plates 20,748,427 pounds, more than half of the whole, were coated with tin, and of these 19,425,336 pounds, nearly 94 per cent., consisted of the class of plates weighing lighter than 63 pounds per 100 square feet; 18,795,160 pounds were terne coated, of which 18,115,741 pounds, or more than 96 per cent., belonged to the lighter class. Of the entire manufacture nearly 95 per cent. belonged to the lighter class of plates.

Two firms whose output for the quarter, chiefly from foreign plates, is understood to have been in excess of 2,000,000 pounds, declined to make a sworn statement to the Government and no account is taken of their manufactures in this report. They are the Burn Stamping & Mfg. Company of Chicago Ill., and Saunders, Fielding & Bond, New York City.

The following is a comparative exhibit of commercial plates (tin and terne plates proper) for the fiscal years 1892 and 1893.

Production of Commercial Tin and Terne Plate in the United States.

Period of manufacture.	Amount made from— American black plate. Pounds.	Per cent. American	Foreign black plate. Pounds.	Per cent. foreign.	Total. Pounds.
Quarter ended—					
September 30, 1891	785,547	95.00	41,375	5.00	826,922
December 31, 1891	1,200,661	85.16	209,160	14 84	1,409,821
March 31, 1892	2,132,082	66.44	1,077 143	33.56	3,209,225
June 30, 1892	5,178,263	63.14	3,022,488	36.86	8,200,751
Total	9,296,553	68.12	4,350,166	31.88	13,646,719
Quarter ended—					
September 30, 1892	5,920,082	54.05	5,032,643	45.95	10,952,725
December 31, 1892	8,043,449	40.71	11,713,042	59.29	19,756,491
March 31, 1893	11,371,968	38.46	18,194,431	61.54	29,566,399
June 30, 1893	18,264,225	46.19	21,279,361	53.81	39,543,587
Total	43,599,724	43.68	56,219,477	56.32	99,819,202

The amount of American sheet iron and steel made into articles and wares tinned or terne plated during the two fiscal years was:

American Sheet Iron Wares Tinned or Terne Plated.

Quarter ended.	Pounds.
September 30, 1891	1,129,217
December 31, 1891	1,359,330
March 31, 1892	1,488,261
June 30, 1892	1,644,059
Total fiscal year ended June 30, 1892	5,629,867
Quarter ended.	Pounds.
September 30, 1892	1,276,932
December 31, 1892	2,472,963
March 31, 1893	2,730,331
June 20, 1893	2,322,455
Total fiscal year ended June 30, 1893	8,802,681

This makes the aggregate manufacture of tin and terne plates in the United States during the fiscal year ended June 30, 1892, 19,267,586 pounds, and during the fiscal year ended June 30, 1893, 108,621,885 pounds; the last-named amount being more than 8,000,000 pounds in excess of the estimated output for the year as shown by the previous reports.

The total American plates used in manufacture of fiscal year ending June 30, 1892, was 14,917,420 pounds, against 52,402,405 pounds during the last fiscal year. Of the commercial plates manufactured in the fiscal year ending June 30, 1892, 33 per cent., and in the last fiscal year ending June 30, 1893, 46 per cent., were tinned as distinguished from terne. During the fiscal year 1892, 90 per cent. of the output of commercial plates were of the class weighing lighter than 63 63 pounds per 100 square feet, and of 1893, 94 per cent.

The sworn statements of producers of black plates in the United States show:

American Production of Black Plates.

Period of production. Quarter end'g:	Lighter than 63 pounds per 100 sq. feet. Pounds.	63 pounds per 100 sq. feet and heavier. Pounds.	Total. Pounds.
Sept. 30, 1892	4,821,180	4,202,277	9,023,457
Dec. 31, 1892	8,575,541	5,444,675	14,020,216
March 31, 1893	13,287,507	6,361,848	19,649,355
June 30, 1893	14,208,192	6,780,321	20,988,573
Total	40,892,420	22,789,121	63,681,541

From these figures of the entire production of 63,681,541 pounds, 40,892,420 pounds, 64 per cent., were of the lighter class.

Of the tin and terne plate manufactures of the year 52,402,405 pounds were American, or 82 per cent. of the entire black plate production of the country for the year.

Colonel Ayer's report of February 20, 1892, showed that one-third of the net importations lighter than 63 pounds per 100 square feet during the fiscal year ending June 30, 1892, was 79,307,939 pounds. The output of tin and terne plates proper of the lighter class during the fiscal year ended June 30, 1893, was 93,850,487 pounds, showing thereby an excess, under the former interpretation of the law, over and above what may be termed the one-third requirement, of 14,542,548 pounds. This is exclusive of the manufactures of American sheet iron and steel made into articles and wares tinned or terne plated.

The total production of commercial tin and terne plates from American black plates of the lighter class during the fiscal year was about 94 per cent. of the entire product,

	Pounds.
or	40,983,741
Add products from American sheet iron and steel tinned or terne plated	8,802,681
Total	49,786,422

The product from American plates during the fiscal year ended June 30, 1892, of the kind subject to comparison with net importations was about five-eighths of the amount necessary to enable manufacturers to meet the one-third requirement under the law, comparison being made with the net imports of the fiscal year ended June 30, 1892.

The report then gives some details of the quantity of tin plates and terne plates imported and entered for immediate consumption and of such as were imported on and after July 1, 1891, and were withdrawn from warehouse for consumption during the fiscal year ended June 30, 1893, and concludes:

From these figures it is seen that of the class of plates weighing lighter than 63 pounds per 100 square feet, there were:

Imports of Tin and Terne Plate:

	Pounds.
Total imports year ended June 30, 1893	594,224,047
Total exports year ended June 30, 1893	128,091,811
Net imports	466,132,236
One-third of which is	155,377,412

One-third of the net imports of the fiscal year ending June 30, 1892, was 79,307,939 pounds, or about one-half

net imports last fiscal year. The aggregate of the entries for immediate consumption and of the withdrawal entries for consumption of tin and terne plates was

	Pounds.
	611,949,980
Domestic product.....	108,621,883
Total.....	720,571,863

This would indicate that the entire consumption of the country during the fiscal year ended June 30, 1893 was 720,000,000 pounds, of which more than 15 per cent. was of American manufacture.

During the three fiscal years ended June 30, 1890, there were imported in the United States of tin and terne plates and taggers' tin an average of 678,000,000 pounds annually.

SCRAP.

THE WORKMEN at the Tintern Tin Plate Works, near Chepstow, England, which were idle for nearly six weeks in consequence of the coal strike, were informed recently that the state of the tin plate trade was so bad that it was impossible to restart the works on a paying basis unless the men rendered some assistance to the management by making some concession. This, after consultation with the officials of the Tin Platers' Union, they declined to do. Consequently the works remain idle and great distress is felt in the neighborhood.

THE ANNUAL MEETING of the stockholders of the American Tin Plate Company was held September 27, at the office of the company, Ellwood, Ind., the following stockholders being present; Col. A. L. Conger, Akron, Ohio; E. F. Latham, Pittsburgh, Pa.; E. M. Bloomfield, Peru, Ind.; I. L. Morris, Chicago, Ill.; J. L. Morris, Boston, Mass.; E. M. Stanford, Atlanta, Ind.; J. F. Hazen, Cincinnati, Ohio; J. Lee Yarman, Richmond, Ind.; M. P. Hutton, Richmond, Ind.; W. B. Leeds, Richmond, Ind.; W. Hollingsworth, Richmond, Ind.; D. G. Reid, Richmond, Ind. The report of the past fiscal year was very satisfactory. The company have succeeded in obtaining a good reputation for their American brand of tin plates and have plenty of orders on their books at present. A dividend of $2 per share was declared, and it was decided not to extend the size of the plant at present, in view of the unsettled condition of tariff legislation and other matters. Following is a list of officers elected: President, Col. A. L. Conger; vice-president, John F. Hazen; treasurer, W. B. Leeds; secretary, D. G. Reid. These gentlemen also comprise the directorate.

ALL THE MILLS of Wallace, Banfield & Co., Limited, at Irondale, Ohio, manufacturers of tin and terne plate and iron and steel sheets, have been running full for two weeks past. The firm have had six tinning stacks in operation, and will put on additional ones during the week. They are a little behind in orders for immediate shipment, but have very few orders booked for late delivery.

THE WORKS of the Morewood Tin Plate Mfg. Company, at Elizabethport, N. J., have been closed down indefinitely, and the workmen discharged. The owners have not yet decided whether the cessation of work in this establishment will be permanent or not. Meanwhile the tin plate works of the Morewood firm at Gas City, Ind., are being actively operated. J. H. Rogers, the head of the Morewood interests, arrived from England last week, and has been staying in New York until yesterday, when he left for Gas City.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

BIDS will be received at the office of the Supervising Architect, at Washington, D. C., until November 2, for work on the United States Post Office building, at San Jose, Cal., including the plumbing and gas piping. Drawings and specifications may be obtained at the office of the superintendent, at San Jose, or from the Supervising Architect, at Washington.

FARNHAM & ALBEE of St. Johnsbury, Vt., have been awarded the contract for placing the steam heating plant in the new Drouin Building.

THE CONTRACT for heating apparatus for the new Toronto drill hall has been awarded to Bennett & Rice of Toronto, Canada.

D. AHERN & SON, Fond du Lac, Wis., have secured the contract for the hot water heating system to be placed in the Warden's new home it the State Prison at Waupun. They also have the contract for a similar job for the Dodge County Jail, at Juneau.

THE BOARD OF EDUCATION of Detroit, Mich., will receive bids up to October 10 for the furnishing and placing in position of heating and ventilating apparatus required for the Washington School.

THE JOINT BOARDS of the Public Library and Museum at Milwaukee, Wis., will receive bids until November 15 for a new building, which will include plumbing, drainage, gas fitting and heating apparatus.

AT A SPECIAL MEETING of the School Board of Sheboygan Falls, Wis., $1000 was voted to repair and remodel the heating apparatus of the High School.

T. P. TURNER of St. Louis has been awarded a contract for new plumbing in the Court House and Jail in St. Louis County, at a cost of $628.

THE STOVER HEATER COMPANY, Freeport, Ill., have been awarded the contract to place one of their heaters in the Exchange Hotel at Savanna.

THE SUM of $1850 has been appropriated for furnishing and heating the Alms House extension at New London, Conn.

SMITH & WEBSTER, 193 Lake street, Chicago, are to furnish Metropolitan closets and other plumbing fixtures for the stations of the Lake Street Elevated Railroad. Also 148 Italian marble Mondete lavatories for the Old Colony Building, Dearborn and Van Buren streets. The State House at Topeka, Kan., is also to be supplied with plumbing goods by the above firm.

THE J. L. MOTT IRON WORKS, 311 and 313 Wabash avenue, Chicago, are furnishing their Titan water closets for the passenger stations of the Metropolitan Elevated Railroad. They are also furnishing their Demorest water closet ranges for the public schools of Chicago, Ill.; San Francisco, Cal.; Eau Claire, Madison, Milwaukee, Wis.; Evanston and North Evanston, Ill.

THE TOWN MEETING at Revere, Mass., recently refused to authorize the expenditure of $1500 to complete the plumbing and heating work in the fire station. It is possible that the heat of the argument indulged in will sufficiently warm the building, but whether the fire hose will serve satisfactorily as a plumbing job is open to question.

JOHN REGAN, 153 Franklin street, New York, is doing the plumbing for the new armory of the Seventy-first Regiment, on Lexington avenue, running from Thirty-fourth to Thirty-fifth street.

THE UNITED STATES RUBBER COMPANY, 90 Reade street, New York, are having a No. 5 Mahony hot water boiler installed to heat their building, by E. J. Brady of 58 Warren street, who does not confine his hot water practice to kitchen plumbing alone.

THE CITY OF CHICAGO is to build an 18-room school building at the corner of Point and Cornelia streets, that will have a system of plumbing, be lighted by gas and will require a steam heating and ventilating plant.

J. G. BEATTIE of Minneapolis, who bid $3410, has been awarded the contract for the plumbing in the new library building at the State University. The contract for the heating and ventilating was held for further consideration, the bids received varied from $8,000 to $13,000.

THE PLUMBING AND GAS FITTING will be included in the general contract for building a new normal school at Stevens Point, Wis, the heating and ventilating plant will be awarded under a separate contract. Bids will be received by W. D. Parker, Capital Building, Madison, Wis., up to October 20.

AT A RECENT MEETING of the Commissioners of DeKalb County, Ill., an appropriation of $1200 was made to put in a heating plant and two bathtubs at the alms house.

THE BOYS' REFORM SCHOOL BUILDING on Bladensburg road at Washington, D. C., is to have a new steam heating plant.

H. A. R. DIETRICH, Bethlehem, Pa., is engaged in placing a steam heating plant in the Globe Building, a large office structure in that city.

Advices from Cleveland, Ohio, report that freight rates on the lakes have at last reached a profitable basis, and many boats are coming out of ordinary. For the remainder of the season business is likely to be brisk with the better class of lake shipping. Ore tonnage commands 90 cents and $1 a ton from Lake Superior ports, being about twice the rates of six weeks ago and very nearly up to the best level of last year.

The new Cunarder "Lucania," before leaving Liverpool on her second trip, had the pitch of her propellers altered to prevent the vibration experienced during her initial voyage. The alteration is reported to have been entirely successful in removing the defect.

A sign of reviving business in the coal trade is seen in the announcement from Shenandoah, Pa., that the employees in all collieries operated by the Philadelphia & Reading Company have commenced working on full time, and will be paid 5 per cent. above the $2 50 basis, the highest wages paid for many years.

PLUMBING and GAS FITTING.

Bacteriology and Sanitary Plumbing.

The following letter from Clarence O. Arey, Philadelphia, appeared in the *American Architect* September 30:

Having dropped the practice of architecture for the study of hygiene, and in particular that branch of it called bacteriology, I am led by the decided change in my views, produced by this study, to write you a few lines regarding sanitary plumbing. The whole system of plumbing, required in all our leading cities, is devised with the idea of keeping out that great bugbear "sewer gas." Now the question immediately arises, what is sewer gas? In order to answer this it is necessary to give a short explanation of the lives and functions of those minute organisms called bacteria.

These are complete organisms consisting of a single cell which live upon organic matter and excrete other matter. They are divided into two general classes—those that live upon dead organic matter and those that live upon living organic matter. Now those that live upon dead organic matter have many gas producers among them—that is, they absorb the dead organic matter as their food, and excrete nitrogen, carbon, sulphur, hydrogen, &c., or gaseous compounds of these. I can now think of no gas producing bacteria that produces disease in man. This gas is as harmless as the gases produced in a chemical laboratory. All that is necessary for safety is their dilution with air below a dangerous limit. This explains why men work continually in sewers and remain perfectly healthy.

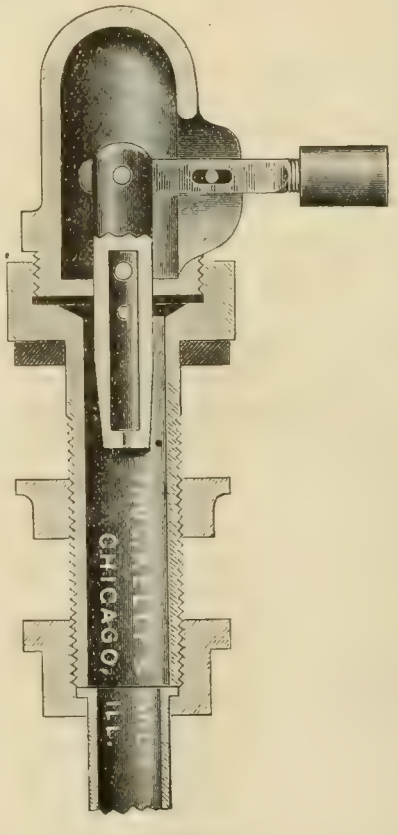
Take an ordinary waste pipe in a dwelling house, the sides up to the parts of the fixtures that are exposed in the room are covered with slimy organic matter, upon which millions upon millions of bacteria are growing. A colony of them which has located themselves below the trap can easily grow up through the slimy matter in the water of the trap to the same matter above the trap; the water in no way impedes their growth, indeed it aids most of them.

Now what we want in a system of plumbing is to keep disease out of the house. The disease producing bacteria will grow in this slime in the same manner as our friends the bacteria who reduce dead organic matter to simple chemical elements—*i. e.*, sewer gas. Now if these disease producers are in the sewers, as in an epidemic, or have been introduced into the waste pipes of a house by the careless disposal of the excreta of a person sick with a contagious disease, what means have we to prevent them from entering our houses? Nothing, except in houses that are provided with fixtures that are easily, amply and continually flushed. Back vents placed along the lines of waste only add extra surface to grow slimy. Main lines of ventilation, of course, dilute these gases, whose only harm is the power of displacing some of the oxygen in an apartment. Our breath is equally bad.

Cleanliness is our only safety. This applies to the waste pipes as well as the fixture. Simplicity, of course, promotes cleanliness. I would drop all back vents; carry all main lines of waste pipe through the roof; prohibit by law the use of any fixture that has an overflow that cannot be easily cleaned; provide flushing tank fixtures and have all surfaces around plumbing accessible for cleaning and made of non-absorbent materials as far as possible.

New Ball Cock.

The accompanying illustration shows a ball cock for which Thomas Kelly & Brothers, Chicago, Ill., were granted a



New Ball Cock.

patent September 19, 1893. The rod connecting to the float passes out of the casing of the cock through the waterway, thus avoiding the necessity of a stuffing box. The spindle or waterway is hollow, with three openings. The water enters through the lower holes and passes out to the tank through the upper one. When the tank has emptied its contents the supply is all cut off except the small opening at the lower end of the spindle, which admits enough water to gradually raise the float and open a full head of water. It thus breaks the syphon and prevents continuous syphoning. The outlet of the valve is submerged before the valve is opened full, the principle being the opposite of a cup leather, the pressure of the water having a tendency to close the leather diaphragm tighter around the spindle. The points claimed by the manufacturer are a syphon breaker, waste preventer and a silent valve. The firm also make a self closing basin cock on the same principle.

TRAPS AND VENTS.

BUILDING INSPECTOR LANE of Butte, Mont., has prepared a sectional view showing the plan on which plumbing must be constructed in accordance with the new plumbing regulations.

E. ASPINALL, 98–100 Beekman street, New York, who hitherto has confined himself almost exclusively to handling porcelain bathtubs, largely the production of English potteries, will now give attention to enameled iron bathtubs. There will be a good assortment of porcelain lined tubs in both rolled and hardwood rims. The Unitas closet, dealt in by the house, is now furnished with a handsome new pattern seat and cover, trimmed with nickeled metal parts of improved design. One of the features is the extension attachment, which compensates for any inequalities in distance between wall and closet and obviates the necessity of a wood back. The parts are held firmly by a thumb nut underneath.

AT A RECENT FIRE at Alpena, Mich., C. T. Park's plumbing establishment sustained considerable damage.

A. E. PEASLEE & Co., formerly of Sioux City, Iowa, are about to open a new plumbing establishment in Austin, Minn., occupying one of the stores of Joseph Keenan on Bridge street. They will make a specialty of all kinds of plumbing goods, together with steam and hot water heating goods.

THE EL PASO PLUMBING & SUPPLY COMPANY have been incorporated at Denver, Col., with a capital of $50,000. They will do business in El Paso, Pueblo, Fremont, Arapahoe and Douglas counties. The principal office will be located at Cripple Creek, Col.

THE BAILEY-FARRELL MFG. COMPANY, Pittsburgh, Pa., issue advance sheets of the catalogue that they are soon to publish. The eight pages that we have received relate to the Vedalia ejector syphon closet. Full page engravings show this closet of oval form and with square back in two combinations; also a sectional view of the closet showing arrangement of passages and vents and its operation during discharge. A similar view illustrates the features of the Triumph tank, made by this firm. In addition to the excellent illustrations, full particulars are given of the different combinations in which the closets are sold.

THE JAMES ALLISON PLUMBING COMPANY of Cincinnati, Ohio, are in the hands of a receiver for the purpose of rearranging their business.

CRAIGHEAD & Co. are a new house that will open a plumbing and gas fitting establishment in the Blease Building, at Broadway and Fifth street, Greenville, Ohio.

A FIRE last Sunday night partially destroyed the Enterprise Sanitary Pottery, at Trenton, N.J., one of the largest

owned by the American Pottery Company. The offices and warerooms were burned, with a large stock of molds. Manager Magowan places the loss as high as $100,000. Some large orders had recently been placed and the establishment was to have started in full operation the next morning after a shutdown of several weeks. The main workrooms and the decorating establishment were saved, but the loss of molds will make a delay of several weeks. The fire is supposed to have been of incendiary origin.

O'Brien & Ryder, 154 Spring street, New York, report an active trade. They have some large warehouse and loft plumbing contracts in course of completion.

E. J. Brady, 58 Warren street, New York, finds it necessary to put on more plumbers to meet the demands of his customers.

The Conference Committees of the Master and Journeymen Plumbers' Associations of New York meet regularly on the second and fourth Tuesday evenings of each month, and to these meetings is largely due the absence of any wide difference existing between the men and their employers. All complaints are heard, investigated and adjusted, so as to continue satisfactory relations.

Last Thursday night John Mitchell, vice-president of the National Association of Master Plumbers, H G. Gabay, president of the Master Plumbers' Association of New York, Thomas H. Radcliffe, president of the Master Plumbers' Association of Brooklyn and other association workers, were at Wilmington, Del., to aid in reorganizing the Master Plumbers' Association in that city.

The regular bimonthly meeting of the Master Plumbers' Association of New York was held last Tuesday evening and was a short session. At a previous meeting resolutions of condolence on the death of Colonel Auchmuty were passed and ordered engrossed, and a copy sent to his family. The resolutions were prepared by members who form one of committees of the New York Trade School.

H. J. Pattison of Montgomery & Pattison, 256 West Eighteenth street, New York, was formerly plumber of the Brooklyn Navy Yard and now holds the office of secretary of the Master Plumbers' Association of New York. At present the firm are busily occupied on contracts and have their office decorated with pictures of some large and handsome buildings in which they have done the plumbing.

J. H. Welteroth, Williamsport, Pa., who is an experienced tinner and a specialist in hot air furnace work is adding plumbing as a branch to his business, having secured a first class plumber for a superintendent of this department. He recently spent a few days in Philapelphia and New York buying Lily tin plate, looking up plumbing goods, visiting the Howard Furnace Company, and taking a view of the new things in steam and hot water heating goods.

Pierce, Butler & Pierce Mfg. Co., Syracuse, N. Y., and 42 Duane street, New York, have issued a catalogue devoted to Lead Pipe, Solder and Sheet Lead, Gas, Water and Steam Supplies, Sanitary Specialties, steam and hot-water Heaters and related goods. The catalogue contains 465 pages, handsomely bound in cloth with an index alphabetically arranged at the back. The company are the patentees and sole manufacturers of the Florida steam and hot-water Heaters, of which illustrations and price-lists are given, showing the complete line, including the latest improvements. The book is copiously illustrated, with list prices accompanying the illustrations, showing large lines of the goods already mentioned. A telegraph code is given for ordering wrought or cast iron Pipe, also for questions, answers, orders and shipments, discounts, &c. The work is very complete and will aid in an intelligent ordering of goods.

Henry J. Maar and George Maar, both experienced workmen, are about to open a plumbing, gas fitting, steam and hot water business establishment in a store that has been remodeled for them, at 16 Washington street, Poughkeepsie, N. Y.

Stewart, Smith & Bergen, Fort Plains, N. Y., have added a plumbing branch to their business.

Bernard's Gas and Pipe Pliers.

The accompanying cuts represent pliers put on the market by the Wm. Schollhorn Company, New Haven, Conn.; Julius Berbecker & Co., 65 Duane street, New York, agents. The pliers shown in Fig. 1 are made in 4½ and 5 inch sizes, for use on burners and small pipe, while the larger cut, Fig. 2, shows the 7-inch size for small and large pipe. All sizes are made of crucible steel, polished and nickel plated. The manufacturers claim that the parallel movement of the jaws with the short fulcrum of the handles on the jaws gives them the advantage of having double the gripping power of the ordinary gas pliers. They state, therefore, that the smaller sizes, which can be carried in the pocket as conveniently as a knife, are as powerful as the ordinary gas plier of double the weight and size. In the large size pliers the parallel jaws open wide enough, and have circular grooves, so that small pipe or rods may be gripped and held lengthwise, as well as in the ordinary manner.

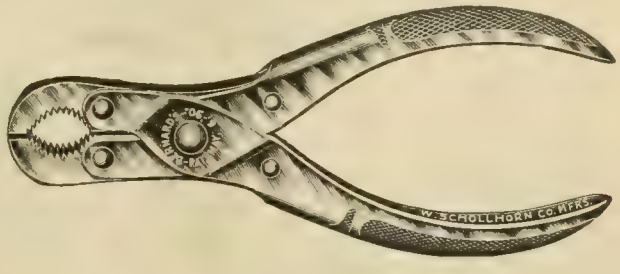


Fig. 1.—Bernard's Gas Pliers.

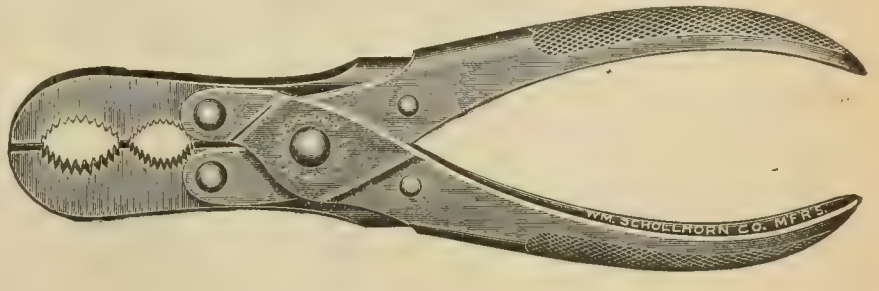

Fig. 2.—Bernard's Pipe Pliers.

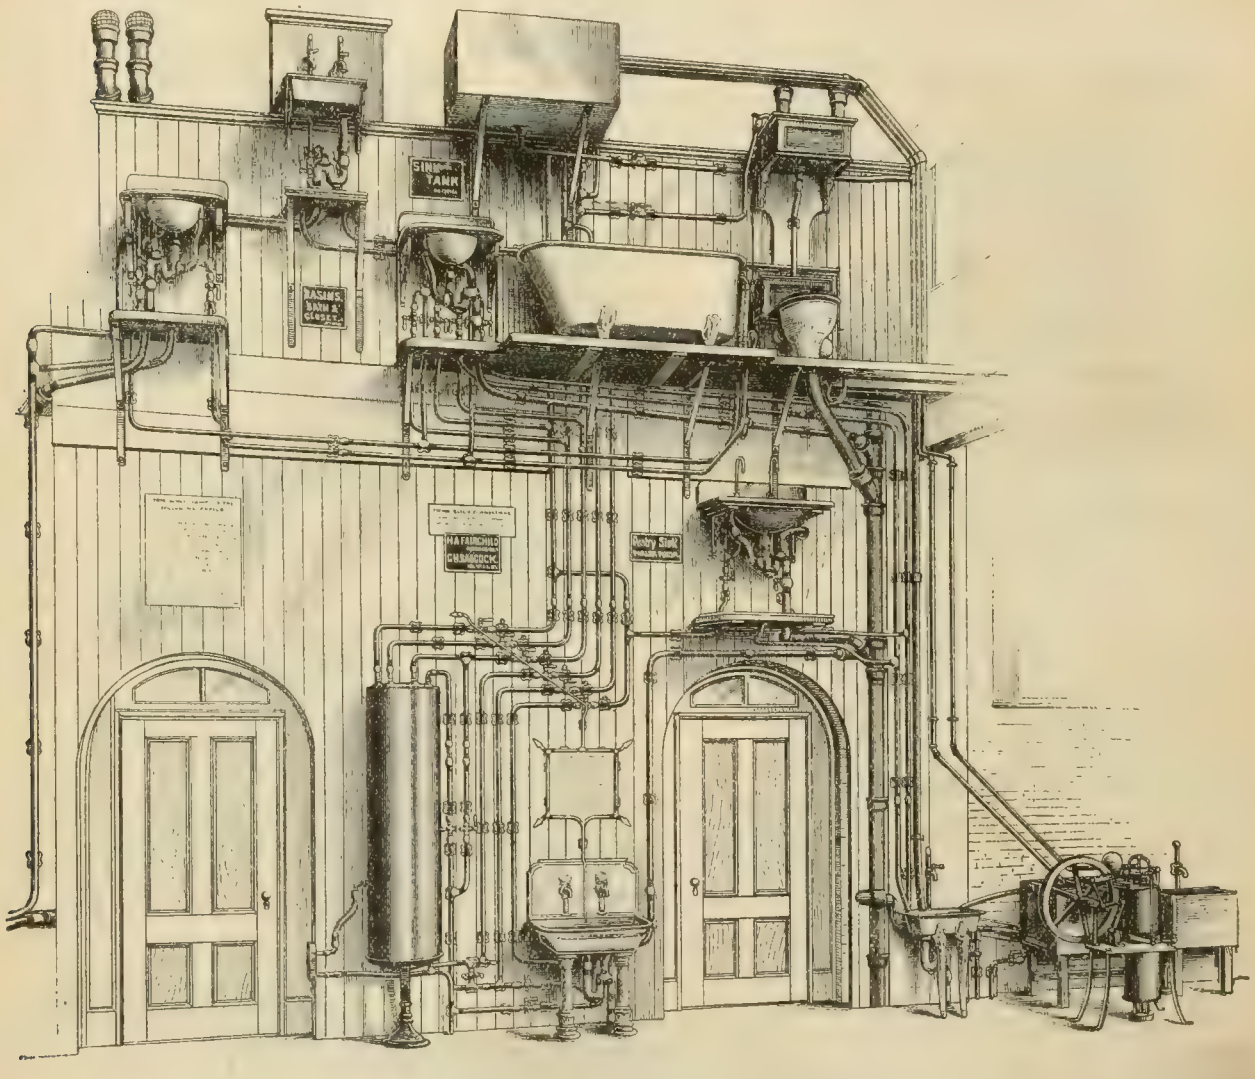
The New York Trade School.

EXHIBIT OF STUDENTS' WORK.

In the account of the closing exercises of the New York Trade School for the season of 1892–1893, which appeared in *The Metal Worker* April 15, brief reference was made to the exceptionally good work of the students of the day and evening classes of the plumbing department. The principal exhibit was what may be described as a section of a house with plumbing complete from kitchen to roof. This work was designed by Mr. Delehanty, the manager of the plumbing department, as the best way to familiarize the young men with the work as done in private houses. A convenient space along the wall where the roof rose to its highest point was selected to represent the section of the imaginary dwelling. Beams placed horizontally divided the several floors, and on the wall at the place indicated the fixtures were set up as shown in the illustration, as follows: On the top or third floor there was a servant's slop sink and the house tank with its supply, overflow and tell-tale pipes in the most orthodox fashion. On the second floor the bathroom fixtures, consisting of bath, basin and water closet, were in position, besides a basin supposed to represent what would be in the front bedroom, while a butler's pantry sink was on the first floor. The sanitary work was most creditably executed, the water closet being porcelain, with trap and bowl in one piece, connected with the floor by means of the regulation brass floor plate, and the other fixtures provided with facilities for hot and cold water supply, and safes and safe wastes in every instance. Independent vertical lines of soil and vent pipes were carried above the line indicating roof and finished with the wire basket usually used in New York.

The basement floor showed the kitchen work, the principal feature of which was a double boiler with its

supply and distributing and circulation pipes fully exposed to view, and so arranged as to provide for tank and street pressure, with the necessary cut-off stop and waste cocks and facilities for the thorough drainage of pipes where necessary. So complete was this exhibit, both as an evidence of the judgment of the designer and the ability of the students, that all that seemed necessary to complete the illustration of a perfect system of house plumbing were the house drain, with its running trap and fresh-air inlet, and the leader with its trapped connection therewith. These were omitted because of there being no cellar in which to lay a house drain, but it is generally conceded that the plumber who can successfully execute all of the lead work required in a dwelling may be safely relied upon to do the iron work in the cellar.



The New York Trade School Exhibit of Students' Work.

Mobile, Ala., was on Monday swept by a destructive storm, which raged over the whole of Southern Alabama. The business part of the city was reported as being 4 feet under water, several lives were lost and great damage to property was done.

The consideration of rapid transit proposals for the city of New York can only be compared in its slowness to the inaction of Senators at Washington on the Repeal bill. A decision in both cases is being loudly called for, while those who have the matter in hand go on their tardy way impassively.

Renting Gas Stoves.

The following, from the London *Gas World*, gives an idea of the financial side of the system of renting gas stoves as followed in England. These figures will be of practical value to managers of works where the system of hiring is in contemplation. They have been kindly supplied by W. R. Chester of Nottingham:

Some statistics as to the purchase, hire and cost of maintenance of gas cooking stoves in Nottingham.

The average net cost of 1511 stoves purchased is £4. 0/3 each.

The basis upon which the rental is fixed is as follows: 10 per cent. is deducted from the list price, and the rental is 10 per cent. on the balance. For example, a stove costs £5, or 100 shillings; 10 per cent. off equals 90 shillings; 10 per cent. on 90 shillings equals 9 shillings per annum, or 2 shillings 3 pence per quarter. This is about 13½ per cent. on the net cost.

The average period for which a stove remains fixed is five years. The average cost of fixing, which is all done free of cost to the consumer, providing he rents a stove for a whole year, and not more than 30 feet of pipe are required for fixing, is 6 shillings 6 pence per stove. The average cost of removing, cleaning and repairing is 6 shillings 6 pence per stove.

The actual rent received for 1511 stoves on hire is £684, or 9 shillings per annum each. The average charge on each stove in use is as follows:

	s.	d.
Cost of fixing, one-fifth of 6 shillings 4 pence	1	3.0
Removing, cleaning and repairing.	1	10.7
Refixing repaired stoves	0	4.4
Inspection and attendance on complaints	1	5.3
Proportion of showroom expenses.	1	4.6
Total annual charge per stove in use	6	4

The excess of rental over expenses is 2 shillings 8 pence per stove per annum.

In ten years only five stoves have had to be renewed. The net rental at present received—2 shillings 8 pence per annum—will, at 5 per cent. compound interest, provide a renewal fund to replace all the stoves once in 18½ years. The life of a stove, based on 10 years' experience, will not be less than 18 or 20 years, and therefore the present rental charged will be sufficient to provide against any actual loss on the business, and the profit on the gas consumed is consequently clear gain.

The average increase in the consumption of gas, where 385 stoves have been fixed, is 15,438 cubic feet per stove for the first clear year. The gas used for cooking purposes gives an increase to the former consumption of about 4 per cent.

Mr. Ransome, Warrington, said that stoves were not let out in Manchester free of cost, but small boiling rings were given away free and were also fitted free in that city.

THE RETAIL STORE.

A New Lamp Stove.

The Dietz Steel Fountain No. 1 is a new lamp stove, patented May 25, 1893, and now being put on the market by the R. E. Dietz Company, 60 Laight street, New York. The tank is of tinned steel stamped in two parts, joined together and soldered securely in the center. It rests in a cast iron fretwork base to which it is fastened. To the tank is secured a screw top for supplying oil and a 4-inch wick tube or burner. This latter is so constructed as to be easily cleaned and to regulate the air currents that pass to the flame.

A New Lamp Stove.—Fig. 1.—One-Burner Stove.

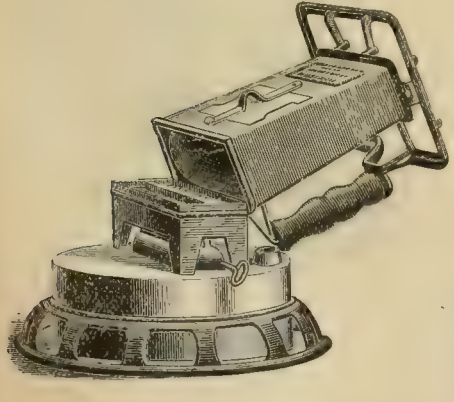


Fig. 2.—One-Burner Stove Open.

It is said that these stoves have been kept burning for hours without unduly heating the tank, and also that the tank does not sweat and become greasy. Firmly hinged to the burner is the chimney, which contains mica windows for illumination, and at the top is a cast iron frame for supporting whatever is to be heated. The chimney and burner are made of steel plate heavily coated with tin and stamped in one piece. They are light in weight, though superior workmanship and construction present much to attract the buyer. The illustrations show in Fig. 1 a one-burner stove ready for use, in Fig. 2 open for cleaning, lighting or trimming the wick, while the two-burner stove is shown open for the same purpose in Fig. 3. When closed for use a substantial catch prevents the possibility of their being opened until the catch is released.

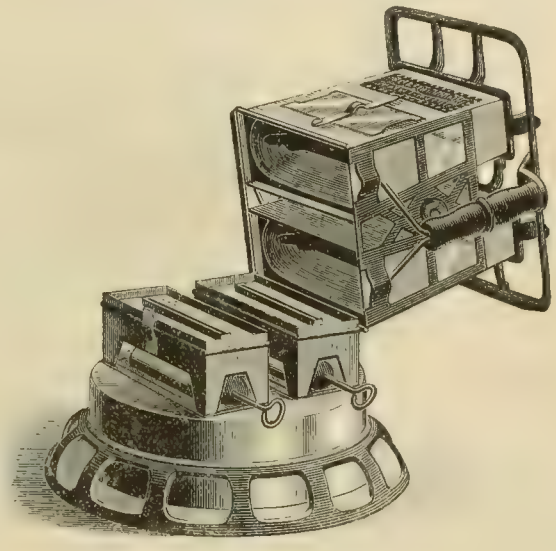

Fig. 3.—Two-Burner Stove Open.

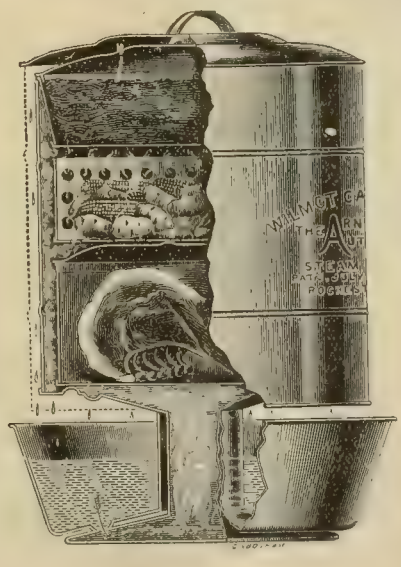
Arnold Automatic Steam Cooker.

The accompanying illustration shows a broken view of the Arnold automatic steam cooker, made by Wilmot Castle & Co. of Rochester, N. Y. Cooking with this device is done entirely by steam, which is generated very rapidly in the small tin vessel under the pan, the pan being simply a reservoir to keep the steam generator supplied with water as it boils away. The steam passes up the tube into the cooking drum. In this drum tight kettles are placed and completely surrounded by live steam so that all foods are cooked without exposure to air, water or steam, preserving, it is claimed, all the flavors and juices, and obtaining the best possible results. With the perforated steamer several kinds of vegetables, it is said, can be cooked at once without the flavor of one affecting the others. The steam, as shown in the illustration, is caught by a receiver, is condensed and drips back again to supply of the reservoir, to be used over again. A special point is made that with the cooker no attention or care is required, as the food cannot be overcooked.



Arnold Automatic Steam Cooker.

Bronson Supply Company, 72 Beekman street, New York, have just arranged to market the entire product of the Ideal Mfg. Company, Philadelphia, Pa. The goods of this company are largely of brass and brass nickeled, among which are some 30 patterns of umbrella stands of about 24 x 8 inches in dimensions, 40 styles and kinds of cuspidors and spittoons, coal hods, &c. The Bronson Supply Company are about issuing a circular letter to the trade announcing the acquisition of this new line of goods.

Ball-Bearing Wringer.

The accompanying illustrations represent a ball-bearing wringer put on the market by the Peerless Mfg. Company, Cleveland, Ohio. The ball bearings are shown in Fig. 2, and their arrangement is described as follows: Four ball-bearing cones are placed in the wood frame, the cones having a perpendicular movement but are horizontally held firm, on the inside by a projection in the frame and on the outside by adjustable cones screwed on to the shaft, which also take up all wear that

might occur to the cones or bearing cases. The cones, it is stated, fit snugly inside the bearing cases, and the cases themselves are close down to the main shaft; also that a drop of oil applied to each bearing either before or just after using the machine is all that is required to keep the bearings in proper condition. The cones and bearing cases are referred to as being of steel, hardened and tempered, and the balls as bicycle balls manufactured by the Simonds Rolling Machine Company. The manufacturers claim that the wringer will do the work with little labor and with little wear and tear, and that it runs so easily a child can operate it. The wringer has a steel spring, malleable iron clamps and other features which, it is remarked, are new and valuable.

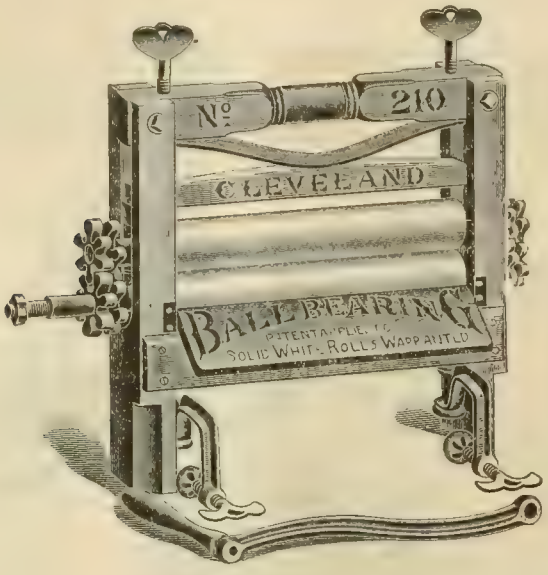


Fig. 1.—Ball-Bearing Wringer.

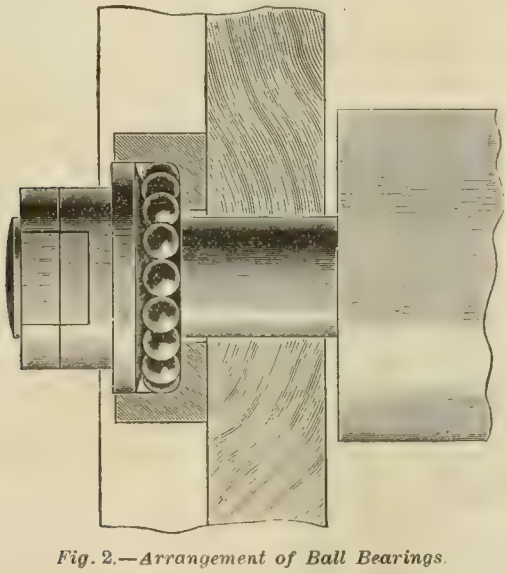

Fig. 2.—Arrangement of Ball Bearings.

A MINIATURE Never-Break steel spider is being sent out with the compliments of the Bronson Supply Company, Cleveland and New York, to the trade. This useful little addition to the desk furniture of an office will serve to remind their friends of the ever increasing demand for these goods. They have sent these little articles out very generally, but if any dealers in the trade have been omitted, they will be very glad to forward them the spider, if desired.

Selling to Consumers.

A letter from a well-known Hardware dealer in one of the larger Indiana towns gives the writer's reasons for not buying goods of manufacturers who sell to consumers. As the trade have the question prominently before them at this time, the following will be of peculiar interest:

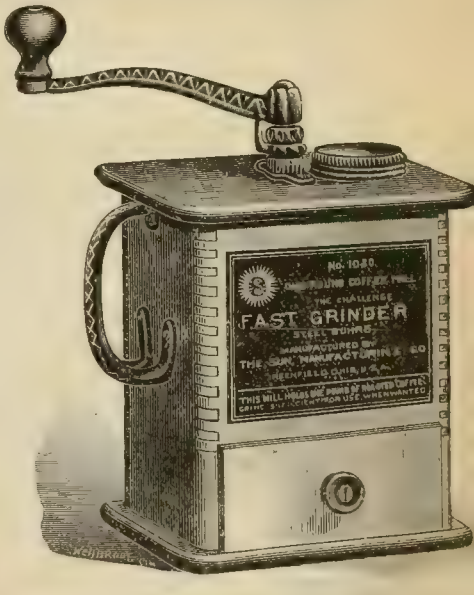
When I came to this city nine years ago I assumed charge of the Stove department of this business. I was very favorably inclined toward a certain line of Stoves, having used one of this make in Minnesota. These Stoves were not handled by any retail dealer in this city. Some two or three weeks after I came here a gentleman came into the store and requested me to send for repairs for a Stove of the make which I was thinking of putting in, and remarked that he got that Stove at wholesale price, as it was not sold at retail in our town, and that the manufacturers said, as they had no agent here, that they would sell him anything in their line at wholesale prices. A few days later another party came in for repairs and said that the gentleman for whom I had ordered the other ones had sent him in, saying at the same time that he also got his Stove at wholesale. I made no remarks to these parties, but I made a mental resolution to the effect that it would be very poor policy for me to handle a line of goods at retail upon which people knew the wholesale prices, and that fall, instead of buying this line, I bought over $6000 worth of Stoves from another house, and mind you that the goods which I purchased were not any more desirable than the line which I was formerly in favor of handling.

Retailers with remarkable unanimity are disposed to condemn the practice of manufacturers selling direct to consumers, and to a good extent are in favor of organization to overcome the difficulty. Our correspondent, referring to this part of the subject, remarks:

I think that it is a wrong business principle for a manufacturer or jobber to sell goods direct to consumers because they do not happen to have a retail dealer in that particular town handling their line. I think that an association formed of the best retail trade, which will pledge itself, so far as possible, to discriminate in favor of those manufacturers and jobbers who confine themselves to the legitimate channels of trade, will accomplish a great good.

No. 1085 Receptacle Mill.

The accompanying cut represents No. 1085 coffee mill, being introduced by the Sun Mfg. Company, Greenfield, Ohio. The mill has a hardwood box with rounded corners, finished with three coats of varnish. It is provided with an air tight canister with screw can top, holding 1 pound of coffee, which can be ground out in quantities as required. The box is mounted with lacquered copper bronze trimmings. The rapid grinding buhrs are made of steel alloy, a metal, it is stated, which will last a lifetime and which will crush gravel without leaving a scratch.

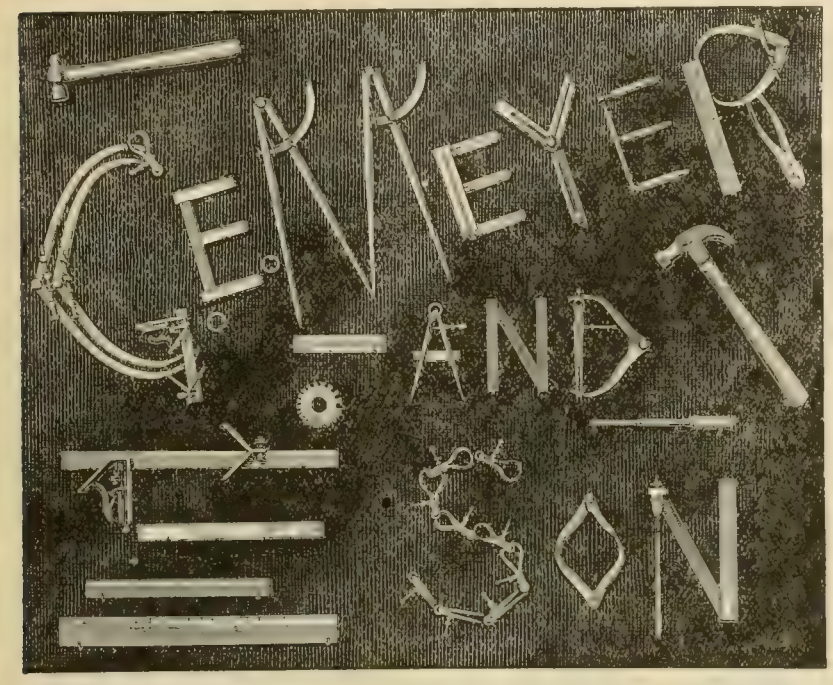


No. 1085 Receptacle Mill.

PEERLESS FREEZER COMPANY, Cincinnati, Ohio, have appointed J. C. McCarty & Co., 97 Chambers street, New York, general sales agents, who will be prepared to name the best factory prices at all times. J. C. McCarty & Co. have a full line of samples of these goods and purpose carrying a stock for the convenience of the trade.

G. E. Meyer & Son's Window Display.

The accompanying window display is reproduced from a photograph, for which we are indebted to G. E. Meyer & Son, South Bend, Ind. The card was arranged on boards covered with cloth, and served the double purpose of calling the attention of customers and passers-by to the fact that the firm handle a fine line of Machinists' and Mechanics' Tools, while it associates the keeping of these goods in the observer's mind with the name of this particular firm. A noticeable feature in the arrangement is the ingenuity and good judgment shown in the selection and placing of the tools, thus displaying the name to the best advantage; for which work W. C. Henry, one of the firm's salesmen, deserves great credit.



G. E. Meyer & Son's Window Display.

Jones' Nail Keg Holder.

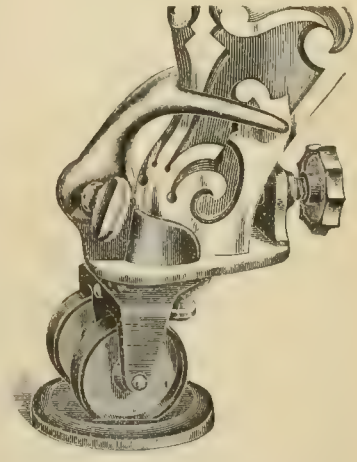
The Orophelian Mfg. Co, Petaluma, Cal., are introducing the nail-keg holder shown in Figs. 1 and 2. The holder is referred to as being made of first-class material, and as strong and durable. In putting a keg into the holder the holder is tipped down in front and the keg put in place, after which the head is knocked in, making a nail bin out of the keg. When nails are required the holder is tipped forward with the scoop under the front of the keg and the nails drawn out with the nail claw. It is claimed that by the use of the holder no nails are left on the floor, hands are not injured in filling a bin, and that time and money are saved, as well as annoyance.

Fig. 1.—Jones' Nail-Keg Holder.

Fig. 2.—Keg in Holder.

Morrow's Adjustable Stove Casters.

Z. D. Morrow & Co., 55 West Washington street, Chicago, are manufacturing adjustable stove casters, as shown in the accompanying illustration. These casters are made of the best gray iron, have no parts to break or get out of order, and are finished in copper and nickel plate. The caster has a base plate, a set screw, with bar touching at either side, forming a clamp, and an adjustable brace which fastens to a lug on the base plate with a bolt, and burr that tightens when the screw comes against the plate from the rear. A circular plate for the floor, with holes to receive the caster wheels, holds the stove steady and secure. The device is simple, neat, durable and economical, and the manufacturers are having a heavy demand for the goods.



Morrow's Adjustable Stove Casters.

Electric ambulances are to be introduced by the city authorities of St. Louis, the various street railways of the city having consented to allow them the free use of their tracks.

STOVE TRADE NOTES.

Mrs. M. E. Strobel.

Last June the announcement was made to the trade through *The Metal Worker* that the stove house of H. Rendtorff & Co., of 16 Lake street, Chicago, had secured the services of a lady as commercial traveler. Manager T. F. Hull of that house was requested to furnish us with a photograph of her for reproduction in our columns, but not until very recently was he able to secure it on account of the modesty of the fair commercial traveler, who shrank from cultivating newspaper publicity. It is with much pleasure that we present to our readers with this sketch a portrait of the first lady engaged in the business of traveling to sell stoves—Mrs. M. E. Strobel, wife of A. F. Strobel of Keokuk, Iowa. Mrs. Strobel is not new to the stove business. In 1858 she and her husband bought a stove foundry in Keokuck, ran it successfully for several years and sold it to Comstock Brothers. They then built the Central Stove Works. At times they found it necessary to acquire and conduct hardware and stove stores in several towns. With he exception of but four years in this long period Mrs. Strobel was actively connected with the stove business. For 15 years she was buyer for A. F. Strobel, while he conducted a large hardware and stove store in Keokuk, making frequent trips to jobbing and manufacturing towns and cities for the purchase of stock. In knowledge of the stove business and the special features of a stove she claims that no salesman surpasses her, which, with the known gallantry of the gentlemen in the trade, they will probably not dispute. Her experience in traveling has also given her special fitness for this new vocation. She has not an easy section to travel over. Her territory comprises Kansas and Nebraska, which are not as thickly populated as the older States. Yet she has visited as high as five towns in one day, wasting no time, taking passage on freight trains when better facilities were not to be had, or hiring teams and driving across prairies. Her husband is at present engaged as a traveling salesman by F. & L. Kahn & Bro. of Hamilton, Ohio, and by a curious freak of fortune also canvasses the trade in Nebraska, coming often in sharp competition with his own wife. Another member of Mrs. Strobel's family, B. A. Williams, travels in Iowa for H. Rendtorff & Co.

Mrs. Strobel is known throughout her territory as "the stove woman." She is of French Huguenot extraction, and possesses all the vivacity of that race. She is of medium hight, has an abundance of brown hair covering a shapely head, and dark gray eyes with a merry twinkle, while her features are almost classically regular. She is a fluent talker and has a persuasive manner which will doubtless count heavily in favor of the house employing her as soon as the times are more propitious and merchants feel safe in laying in stocks of stoves. She is now making a trip through her territory, calling on the trade.

MRS. M. E. STROBEL.

Laura Nevins Range & Heating Company

of St. Paul, Minn., have a practical exhibit, in Section D, of the Boiler Extension, Machinery Hall, World's Fair, consisting of one of their ranges in regular operation. This construction has a down draft, as has been previously explained to our readers, and is suited to any kind of fuel. As a heater it has several points of interest. Cold air received from the floor is passed through a 7-inch passage around two spacious ovens and comes out through a hot air discharge pipe. At the test made last week by one of the judges of awards, cold water boiled four minutes after starting a fire and a full meat breakfast was ready in 24 minutes. The stove is made in two sizes, is handsome in appearance and substantial in construction. In addition to the above exhibit the company also have a range in the Pennsylvania cooking school, near the Forestry Building, and a booth in Section O of the Manufactures Building.

From the Michigan Stove Company a neat memorandum book has been received the past week, which is a sample of those now being distributed by their agents throughout the country. It is of vest pocket size and contains a blank space for an identification record.

Future of the Hot Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

FORCING SALES.

Complaint is frequently made by the adversaries of hot air heating of the methods employed by furnace makers and dealers is forcing sales It is claimed that excessively long time is offered by furnacemen as an inducement to adopt this form of heating. It is said that in many parts of the country furnaces are put in during the spring and summer months, and one-half of the purchase price is made payable on the 1st of the following January. This is certainly long time and in many lines of trade would be considered poor business policy on the part of both buyer and seller, but in the furnace business there are reasons to justify the time given. In the first place, by giving time on part of the contract price an opportunity is given to the buyer to test the furnace before completing the payment, which in itself inspires confidence on the part of the buyer in the heater, as in any event the great risk is that of the seller. Again, furnaces are going more and more into the homes of the middle classes, who have not at all times the funds wherewith to pay the cost of the apparatus complete, but who, if given a few months' time, could raise the required sum. It is astonishing the amount of money paid out monthly in cities for furniture, sewing machines and household goods on the installment plan, which otherwise would not be bought, and it is the rule that these payments are promptly met. It is undoubtedly a fact that the sales of furnaces have been largely increased by the giving of time by the furnace contractor and he has been enabled to do this by the aid of the furnace maker who has dated ahead purchases made during the early months of the year.

ADVANTAGES TO THE DEALER.

An advantage to the dealer is in getting a fair share of his furnace work done during the dull months and in advance of the fall rush, and he can thus give to the work closer attention than if done later in the season. One dealer who has followed the plan of giving time on furnaces stated to me recently that in some years he had had fully 90 per cent. of the deferred payments in his hands by December 15, or as soon as the buyers were satisfied with the furnaces.

In my opinion time should not be given by maker or dealer except in cases indicated above where trade can be ob-

tained in no other way, and it would be better to offer to buyers the temptation and inducement of a cash discount on work done early in the season, and this would be taken advantage of by a few buyers certainly, and it would be worth the discount to the dealer to get the accounts closed. Work done during the summer months costs the dealer less and he can afford to share this saving with the early buyer.

TREATMENT OF CUSTOMERS.

Furnace makers in the past have treated their customers liberally and have often sent their best salesmen long distances to aid agents in effecting sales, and in many cases the attending sales have come far short of the expenses incurred, but the manufacturer has in mind the welfare of his goods and looks to the future as well as to the present for his profits. Each furnace that does good work is advertising both maker and seller, and future sales are a certainty. The growing demand for furnaces is due very largely to the increasing desire throughout the country for "creature comforts," under which head a good furnace surely comes.

Forcing sales by cutting prices and then slighting the work is poor policy, but any legitimate methods of swelling the total sales of furnaces throughout the country should be heartily approved of.

Another thing which the furnace dealer should not overlook is that if he loses a job to a competitor who does good work, the cause of good heating is thereby advanced in that town, and each good job makes it easier to effect other sales by the dealer, whereas poor work by one dealer in a town makes it uphill work for the dealers who are handling good articles and doing good work.

(*To be continued.*)

A Golden Wedding.

Mr. and Mrs. William P. Abendroth of Portchester, N. Y., celebrated last week, at their home at Echo Hill, the fiftieth anniversary of their wedding. A large number of friends were present to congratulate them upon the completion of 50 years of married life, and many who were unable to be present sent letters of congratulation. The parlors of the house were beautifully decorated with ferns, autumn leaves, golden rod and potted plants, Mr. and Mrs. Abendroth receiving their guests standing beneath a canopy of vines with a background of palms. The couple were also the recipients of many handsome presents from friends in different parts of the country. Mr. and Mrs. Abendroth were married on October 2, 1843, and have five children, nine grandchildren and three great grandchildren, all of whom were present at the celebration. Among the guests may be mentioned Mr. and Mrs. John B. Fraser and daughters, Jersey City, N. J.; Mr. and Mrs. Mulford Valentine, Woodbridge, N. J.; Mr. and Mrs. George H. Lary, Mr. and Mrs. Jordan L Mott, Mr. and Mrs. John H. Keyser, Mr. and Mrs. Salmon W. Hoyt and daughter, and David Close of New York; Mr. and Mrs. Frank A. Abendroth, Chicago, Ill.; Mr. and Mrs. John F. Mills, Mr. and Mrs. F. J. Marshall, S. K. Satterlee, William Ryan, and Mr. and Mrs. A. D. Phelps, also of New York City; Mr. and Mrs. M. P. Blauvelt of Jersey City; Mr. and Mrs. J. Dykman of White Plains; Horace B. Newton and Gen. John C. Rathbone of Albany; Robert Bruce of Greenwich, Conn; General Samuel H. Johnson, Archdeacon Kirby and Mr. and Mrs. R. F. Downing of Rye; Mr. and Mrs. Martin Keogh of New Rochelle, and Mr. and Mrs. Samuel Meeken of Brooklyn.

Estate of P. D. Beckwith.

"Round Oak Stoves, Dowagiac, Mich.," is the inscription in old gold letters upon a crimson background, constituting the side title of a little pamphlet of 30 pages issued by the Estate of P. D. Beckwith of the place named. The printing is on a good quality of paper, the edges of the pages are finished in light yellow, while the binding is in stiff boards. The frontispiece is an excellent likeness of the late Mr. Beckwith, following which is an announcement to the trade. Attention is called to the fact that for more than 20 years Round Oak stoves have been a specialty of the manufacturers, and no pains nor expense have been spared to attain a high standard of excellence. From a few workmen and a small amount of material in 1871, this business has steadily grown in proportions until at the present day an extensive plant is required, giving employment to 300 men and melting over 30 tons of pig iron daily the year round. The makers state that the leading feature of their goods is their adaptation to all kinds of fuel. By a change of inside fixtures each stove will burn soft or hard coal, coke or wood, thus fitting it for all seasons and all localities. The Round Oak stove is fully described in the catalogue before us, its special features being emphasized in a way to interest the dealer. Numerous varieties are illustrated and a price-list is given of extra parts. At the close reference is made to the circular letter issued to customers under date of September 10, 1891, a perusal of which is likely to interest agents of Round Oak stoves wherever located.

ODD PLATES.

TERSTEGGE, GOHMANN & Co. resumed operations in all departments of their extensive works at New Albany, Ind., on Monday, September 25. A large force of workmen are employed and the company consider the outlook encouraging.

A PRESS DISPATCH from Kokomo, Ind., bearing date of September 29, states that the William G. Fischer Safe & Range Company of that place have made an assignment, with liabilities of $40,000 and assets about the same.

BELLAIRE STOVE COMPANY of Bellaire, Ohio, have recently established a branch salesroom at Martin's Ferry, for the purpose of facilitating the distribution of their product.

THE CHICAGO & ERIE STOVE COMPANY of Erie, Pa., are directing the attention of the trade to their lines of hard coal base burners provided with ovens. These goods were new last season and have been thoroughly tested in practice, so that the manufacturers are confident of their satisfactory operation. In some localities the base burners are in great demand and the company look forward to a good season's business.

ROBERT SCHUELER & Co., 615 Ogden avenue, Chicago, have brought out a line of gas heating stoves under the name American. Their catalogue, which has just been issued, comprises 12 pages of illustrations and descriptions. The stoves shown are handsome in appearance and are stated to secure the best results at a minimum cost for fuel. The line comprises square and cylindrical stoves, in eight styles and sizes. They are made with copper reflectors and asbestos flame plates burning a blue flame, or with highly polished copper reflectors and illuminating flame. Gas stove supplies are also furnished to the trade.

ONE OF THE ENTERPRISING STOVE CONCERNS in the West is Kiechle, Brentano & Oberdorfer, proprietors of the Southern Stove Works, at Evansville, Ind. Their goods are in active demand from all sections, and some large shipments have recently been made. Probably that which may be considered the most noteworthy was forwarded not long ago from Howell by special freight to Texas. The train consisted of 18 cars, filled to their utmost capacity with ranges, cook stoves and heaters. On telegraphic orders five carloads were forwarded a few days previous to this one, which was made about the middle of September, and was followed by ten additional carloads shortly after the special train started. The combined weight of the contents of the 18 cars was 462,300 pounds, and the freight bill was $3107.25. The issue of the Evansville *Tribune* of September 13 contains an interesting history of the Southern Stove Works and refers at some length to this shipment of stoves. In the course of the article the statement is made, for the purpose of showing the extent of the business of the concern, that one of the traveling salesman, Charles R. McAdam, sold 85 carloads of stoves on one trip through Texas, and that six other traveling salesmen cover the Southern, Northern, Southwestern and Western States. The business of the Southern Stove Works was established in 1867 by Hebling & Co., which concern was succeeded by Browneller, Grayville & Co., and then by Browneller, Kiechle & Grayville. The foundry proper now occupied by the Southern Stove Works is said to be the oldest plant in the State and was rebuilt and enlarged in 1886. The article in the *Tribune* also gives a brief biography of the members of the firm, and refers to the force of hands employed.

ONE OF THE EXHIBITS at the Western New York Fair, recently held in Rochester, N. Y., was that of Levi Hey & Co., who displayed in Stove Hall a number of specimens of Splendid goods made by the Fuller & Warren Company of Troy, N. Y. The exhibit was made up of ranges and heaters, and was the subject of no little interest on the part of attending visitors.

ACCORDING to a recent issue of a local paper the Central Stove Works of Lebanon, Pa., are doing a good business and are actively engaged in all departments. They have a gratifying number of orders on hand and consider the outlook for the near future at least very promising. Among their recent shipments were two carloads of ranges and heaters to Philadelphia.

THE WOOLDRIDGE STOVE COMPANY of Memphis, Tenn., resumed operations a few days ago owing to increasing orders for their product, and they consider the outlook for autumn and winter encouraging for a fair volume of trade.

THE SUPERIOR FURNACE COMPANY of Little Falls, N. Y., send us a copy of an illustrated pamphlet of Superior furnaces and heaters for the season of 1893-94. Within its covers, which are lithographed in colors, attention is invited to combination hot water and

steam heaters adapted to warm dwellings, churches, hotels, public and private institutions, banks, stores, &c., and manufactured under United States patents. Various methods of heating are described, while timely suggestions are likely to interest those in need of heating apparatus. The Superior furnaces are very fully described, and illustrated by means of sectional views, while tables are presented giving dimensions and capacity of the various sizes. A chapter on the importance of ventilation is given, as well as directions for setting up Superior furnaces in portable form and also in brick work. A number of pages are devoted to testimonial letters showing what people who have used the Superior warm air furnaces have to say concerning their merits. The third page of the cover carries a general view of a row of ten houses on Ellis avenue, Chicago, heated with ten No. 52 Superior steel furnaces.

THE TWO CITY PLANTS of the Reading Stove Works, Reading, Pa., which were running only on partial time, were put into operation last week on full time, with more than 300 men at work. The foundry at Millmont, Pa., has not yet resumed operations

THE SOMERSWORTH MACHINE COMPANY of Dover, N. H., are distributing an advertising novelty in the shape of a 15-inch wooden rule finished with a metal edge. The name and address of the company appear in large black letters upon the side carrying the marks dividing the rule into inches, while on the other side is a list of some of the stoves, ranges and heaters manufactured by the company. The statement is also made that the company turn out box and cylinder stoves, lawn vases, bouquet holders, sinks, hollow ware, spiders, ash and boiler mouths, funnel thimbles, &c. The rule is a useful article to have about the desk or shop, and dealers receiving samples are likely to have them within convenient reach. By this device the company will also keep their name and address constantly before the attention of the trade.

R. E. DIETZ COMPANY, 60 Laight street, New York, find their oil heaters in popular demand at this season of the year. They are made in three styles—fire place heater, No. 4 radiator and parlor heater, all of which give a brilliant illumination as well as strong heat.

THE DETROIT STOVE WORKS, Detroit, Mich., send us illustrated circulars of the Imperial Jewel square base burning parlor stove, which they are offering the trade in three sizes. This is a handsome heater, with ample mica illumination and full nickel trimmings. The more important features include duplex grate combined with shaking ring, solid rotating fire pot, gas cover under swing top, working automatically, large ash pan, hot air ventilating flue and tea kettle attachment. The manufacturers refer to this heater as the highest example of modern stove construction and as being distinctive and original in design.

THE J. L. MOTT IRON WORKS of New York and Chicago have issued some interesting publications in the shape of two pamphlets, one illustrating laundry ranges and iron heaters, while the other calls attention to Mott's combined furnaces and caldrons for coal or wood. The former work shows an interesting assortment of stoves intended for heating sad irons of various descriptions, some having a capacity for heating as many as 30 irons. The Scorcher heater for heating open or circulating boilers is also illustrated and described, as is likewise Mott's Sunray water heater, made in four sizes. Prices of coils of wrought iron piping with ground-in brass couplings fitted to laundry stoves constitute a feature of the pamphlet. The assortment of furnaces and caldrons illustrated and described in the second pamphlet is a varied one, and in connection with the tables of measurements and capacities is likely to prove interesting to dealers handling this class of goods. Two pages are devoted to illustrations and descriptive text relative to flue linings and the manner in which they are built in.

THE DANGLER STOVE & MFG. COMPANY, Cleveland, Ohio, announce that they have solved the difficult problem of vaporizing gasoline fluid in a generating burner without the inconvenient and unsightly elevated tank. This is claimed to be accomplished by a new device in their New Delight burner. The design is referred to as being unique, handsome and convenient, and as "one of the most wonderful inventions in the line of vapor stoves of the age."

DE HAVEN & CO., Limited, Pittsburgh, Pa., are directing the attention of the trade to their new parlor stove, which they have termed the Perfect Cinderella Franklin. This stove is described as a new and beautiful open front parlor stove of superior merit, containing a number of new and novel features, among which are the patent automatic blower and draw center basket grate. The stove is fully embellished with nickel and tile, and the design is of the latest and most approved style. It is made in three sizes, numbers 12, 14 and 16, and the firm confidently expect a large trade in this stove, for which they have already received numerous orders.

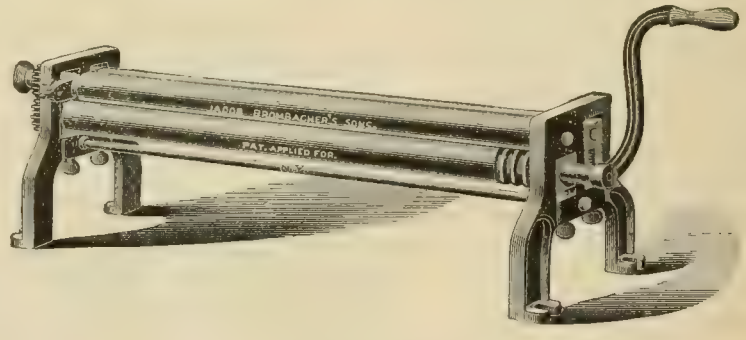
ON THURSDAY MORNING sheriff John J. Gorman held a sale at 92 Beekman street, New York, to dispose of the stock and goods of the Richardson & Morgan Company. This method of rearranging their business was resorted to as the most satisfactory to some of those interested. The entire stock of stoves, ranges, furnaces, steam and hot-water goods and repairs were bought in for the house, and business was resumed immediately after the sale. A renewed energy will be devoted to bringing some of the new things they have to the notice of the trade.

C. H. BENNETT of Cincinnati, Ohio, has issued a pamphlet illustrating and describing his patent smokeless furnace, to which we called attention a short time since.

THE WESTERN STOVE MFG. COMPANY of St. Louis, Mo., have added to their assortment a new line of wrought steel ranges, which are known under the name Lady Jane. The goods are constructed with a view to economy, durability and general utility, and have large oven, asbestos lined flues, swing feed door, scuttle ash pan and drop oven door. A high warming closet is a special feature of the Lady Jane, the front swinging back and allowing full surface for warming dishes. The water coils used have been thoroughly tested and are claimed to be satisfactory in every particular. Several varieties of the Lady Jane have been brought out and are illustrated by means of a circular which the company have just issued. The makers are also directing attention to an odd shaped construction known as the Rattler. It is made in two sizes and is adapted for heating halls, stores, churches, warehouses and the like.

New Slip Roll Former.

The accompanying cut represents a new slip roll former which Jacob Brombacher's Sons, 30 Cliff street, New York, have brought out, and patent for which has been applied for. The



New Slip Roll Former.

distinctive features of this former are that the boxes rest on the ends of adjusting screws instead of hanging on to the thumb screws, which, it is pointed out, avoids the breaking of the thumb screws, and also makes boxes more easily adjusted. In this former the object of the slip roll former is obtained by pushing up the thumb piece at the left of the roller, which permits the sliding of the roller to the left sufficiently to lift it out of the journal and slide off the work. At the same time the gears are so arranged that in performing this operation they cannot become detached from one another. By this construction it is claimed that all the benefit of a slip roll former is obtained, with, at the same time, all the rigidity of an ordinary former, as this form of operation permits of a solid frame at both ends.

The machine is simple in construction, and the adjusting screws are protected from injury by being placed between legs. Both frames, it will be observed, are cast with open lugs which permit of the rapid insertion of the bolts necessary to hold the former to the bench. The rollers on this machine are made of cold rolled steel and the gears are cut out of the solid metal.

All parts of the machine are made on the duplicate part process and interchangeable parts can be obtained at any time. Jacob Brombacher's Sons are making this machine at present in the following sizes: 1¾ inches and 2 inches diameter, 30¾ inches long; and 1½ inches diameter, 16 and 20 inches long.

TRADE REPORT.

The Iron Market.

The feeling of discouragement is speading in the Iron trade. An increasing number of manufacturers and merchants are shaping their business on the conviction that the balance of the year will not bring out enough business to give mills and furnaces adequate employment and thus lay the foundation for a recovery in prices.

The great majority of the rolling mills throughout the country who are attempting to run are working spasmodically. This means relatively high cost of production, which they aim to correct by securing more work. So many are trying that plan now that prices are in the demoralized condition characteristic of nearly all the markets. Too many makers have been too sanguine and are now paying the penalty for what seemed to be some weeks since a justifiable view of the situation.

A good many men in the Iron trade have been inclined to charge the delay in the repeal of the Silver bill with the greater part of the responsibility for the depression. Their views seem to be undergoing a change. We often hear the opinion expressed now that little improvement will follow even a straight out repeal. Even if that opinion is incorrect it will take an accumulation of evidence before it is abandoned. That, again, means delay in the return to confidence and to buying in the Iron trade.

During the week there have been no reports of offerings of material by those who had made advances on it, so that that disturbing element which has been most conspicuous in the Pig Iron trade is now absent. Instead, there are indications, notably in Chicago and Cincinnati, that consumers have so far cleaned up their stocks that they are forced to become more liberal purchasers.

Pig Iron.—The market in New York is very dull and continues irregular, occasional low offerings being made, notably by Virginia furnaces. There has been some talk this week of the formation of a syndicate to take over 15,000 tons of bankers' Iron. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

In the Philadelphia district the movement in Pig Iron is very slow, low prices being no inducement to those who are not in need of material. The output is supposed to be in fairly close proportion to consumption, but the accumulations of earlier months are an insurmountable barrier to an improving market, so that until these are absorbed prices are likely to remain weak and unsettled. The demand is confined to small lots at about the following range of prices, but on large lots or forced sales concessions can be had according to the circumstances in each particular case. $12.25 @ $12.75, delivered, for Plain No. 2; $13.75 @ $14 for No. 2x; $14.25 @ $14.50 for No. 1x.

From the Chicago market the inquiry is reported as fair, and while sales are generally of small quantities there is an occasional transaction of good size. One order was placed for 1500 tons of Southern Coke for scattered deliveries and there are rumors of a much larger deal. Instructions are being received to resume shipments on old contracts. The revival in demand now experienced appers to be due generally to the complete cleaning up of stocks of Pig Iron at foundries and not so much to any special improvement in the business of the foundries themselves. The stocks at furnaces are being drawn on so steadily that a decided decrease is expected to be shown at the close of this month. Inquiries for Charcoal Iron are in the market, but not for large quantities. Prices show no change. Quotations are now as follows for cash:

Lake Superior Charcoal	$16.00 @ $16.50
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.50 @ 12.75
Local Scotch	14.0 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 14.50
Southern Silvery, No. 2	@ 14.00
Southern Coke, No. 2	12.35 @ 12.60
Southern Coke, No. 3	11 60 @ 11.85
Southern, No. 1, Soft	12.35 @ 12.60
Southern, No. 2, Soft	11.85 @ 12.10
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	18.50 @ 18.75
Hocking Valley, No. 1	15 25 @ 16.00
Jackson County Silvery	16.00 @ 17.00

Pittsburgh advices mention a very light demand for Pig Iron, which, it is thought, will be likely to remain light until there is a heavier demand for finished material. Buyers admit that now is a good time to buy Iron for future wants, but yet they do not place their orders. Quotations are given as follows:

No. 1 Foundry	12.75 @	13.00,	cash.
No. 2 Foundry	11.75 @	12.00	"
Charcoal Foundry No. 1	14.00 @	15 00	"
Charcoal Foundry No. 2	13.00 @	14.00	"

There appears to be a more confident undertone to the Southern Pig Iron markets; not that there are any large transactions at better prices, but there is less calamity Iron being forced to sale and the Southern furnaces have a voice in making prices, not leaving it entirely to buyers. There have been no large transactions during the week, but a moderate run of consumptive orders, ranging from single carloads up to 700-ton lots; 400 tons No. 2 Foundry and No. 1 Soft sold at $8.25, f.o.b. Birmingham, but it is understood that some No. 2 Foundry is yet obtainable at $8. In fact, there is nothing to warrant any change in quotations. There is more inquiry from stove works, and it is confidently predicted that liberal sales will be made to them in the early future, if the repeal of the Silver Purchase law goes through the Senate, for until this matter is out of the way there is no disposition to enter into any important business engagement. Quotations are as follows:

Foundry.

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke No. 1	15.00 @ 15.25
Lake Superior Coke No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25

Car Wheel and Malleable Irons.

Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—The price for Straits Tin for prompt delivery has been moved up to 21¢ ℔ lb. In remote instances a shade more was paid. Deliveries at sellers' option this month and the balance of the year advanced correspondingly. Purchases by jobbers and consumers have, according to most accounts, been very moderate, but official statistics make it read that the consumption last month was equal to that of July and August, and that spot stocks, exclusive of the Pacific Coast, have been reduced to 5155 tons, or, say, less than four months' estimated consumption. At the close the market was rather soft, with sellers at 21¢, cash, for prompt delivery, for lots of 10 tons and over. Data posted on the Metal Exchange affords the following comparison:

Shipments:	Sept. Tons.	Aug. Tons.	Juy. Tons.
Straits to Great Britain.	2,200	2,300	1,150
Straits to Continent Europe	1,100	1,900	1,200

Copper.—The only change in the market for this metal is a somewhat higher level of speculative bids for Lake Superior Ingot. Whether it is significant or not remains to be seen. It is the fact, however, that those bids were not high enough to lead to business. Outside of what may be termed the speculative circle there has been no change whatever. Home consumers have purchased in a strictly perfunctory manner; export movement has been chiefly in delivery on old contracts and the offering has shown no sign of change on the part of sellers. In any event, 9¼¢ stands as strictly inside price, while 9⅞¢ @ 10¢ is generally quoted. The retail consumptive demand has been fair during the week, although hardly up to the expectations formed a few weeks ago. For small lots jobbers again quote 11¢ on Lake Ingot.

Sheet Copper.—Moderate sized orders for Cornice Copper, although hardly up to the volume of last week, keep business moving in this line. Otherwise there are no new features to note. Prices remain unchanged, as per list.

Pig Lead.—About 1000 tons of Common Domestic have changed hands during the past week, chiefly for October and November delivery. The terms were 3.70¢ @ 3.75¢ and about equal quantities went at respective prices. At present 3.70¢ is bid, and there are few, if any, sellers of round lots at less than 3 75¢ for any delivery during the balance of the year. While average prices are thus lower at the present time than they were a week ago, the market has gained somewhat in tone since the consummation of the contracts above referred to. Jobbers report the demand from consumers to be no heavier than that of last week, which was very meagre, and signs of softening in prices are not wanting.

Lead Pipe and Sheets.—No improvement in the market for this material has yet developed. Orders and inquiries in the retail trade are reported as unusually light, and there is an inclination to mark down prices in some quarters.

Spelter.—Single carloads of ordinary Western have been sold to a moderate extent at 3.80¢ for November and December delivery. Bids of 3.75¢ have been solicited for round lots, in the face of reported light supplies in first hands and comparatively small production at the present time. Eastern consumers are very indifferent buyers, however, and influenced little, if at all, by the reports from the primary sources of supply.

Tin Plates.—The market for Tin Plates is devoid of any distinctly new features. The demand for Coke Tins from Southern consumers, which caused quite a lively flutter for two or three weeks, has again fallen off, and the decline has not been counterbalanced by any special increase in requirements for other descriptions of Plates. While a fairly brisk jobbing trade has been experienced, and from some quarters a decided increase in inquiries is noted, the general run of business still keeps below the average for the season. Terne Plates are quiet, the major portion of consumers' requirements in this line having been filled. Such business as is going is almost wholly confined to spot orders for moderate amounts, and "futures" continue to be neglected. Shipments from abroad continue to be narrow, and are not likely to increase to any great extent while uncertainty exists as to the trend of tariff legislation. Naturally, there is some unevenness in prices, but no change of importance has taken place during the past week. Certain useful sizes of Coke stocks, which were depleted by the recent demands from Baltimore oyster packers and other canners, still continue scarce and command a slightly higher price. Stocks of all kinds of imported Plates in the hands of dealers are low, and consumers have taken little beyond the material required for their immediate needs, so that the Tin Plate market is in good shape for a brisk business when a revival does develop. A special cable dispatch to *The Iron Age*, dated October 4, gives the following report of the British Tin-Plate trade: For Tin Plate inquiries have been more numerous, but actual business was small, owing to the lowness of bids, except for Oil sizes. Large buyers of the latter have shown some disposition to stock up at present rates. There is also rather more business in the Ternes, but at low prices. Liverpool quotations are as follows:

IC Charcoal, Alloway grade	12/9 @ 13/3
IC Bessemer Steel, Coke finish	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12/
IC Coke, B V. grade, 14 x 20	11/6 @ 11/9
Charcoal Terne, Dean grade	@ 11/6

W. H. JEFFERS, formerly of the firm of Jeffers & Kumberger, has opened a new office at 434 Canal street, New York, for the sale of the Backus Gas Engine. Mr. Jeffers had 20 years experience with the Otto Gas Engine, and is well equipped with machine shop and appliances to do gas engine work.

LACK of immediate orders has caused the American Sheet Mill at Phillipsburgh. N. J., to shut down.

Chicago Report.

Scrap.—Business shows signs of improvement, and dealers are offering more money to country collectors, as shown by the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$8.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....

Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

IN A LETTER lately received from William J. H. Gluck, Baltimore, Md., he says that amid the general closing of factories and business disasters he is happy to say that he has been running his factory full the whole year, just the same as during the former months, and expects to keep this up for the balance of the year. "At times it took all the courage I could command to keep things going; but I think the worst calamity that can befall us is to deprive the laborer of his living by closing factories and shutting out his opportunity to earn wages. At all hazards the manufacturers should be encouraged and helped to keep their factories running. My spring business was very good, summer business moderate and fall business, so far, fair."

WE ARE INDEBTED to Lord & Thomas, 45 Randolph street, Chicago, Ill., for a serviceable little rule, 6 inches in length, arranged for measuring advertising space. These rules are being distributed to general advertisers, and will, no doubt, be found useful.

CONDITION OF THE

Hardware Trade.

A SOMEWHAT BETTER DEMAND is reported by jobbing houses since the opening of October, which is in part accounted for by the fact that orders are usually placed with more freedom the first week or two of the month, and especially in such times as the present, when money is not overabundant. The volume of business, on the whole, continues without material change and the trade are still purchasing with great care and caution. There is a good deal of inequality in the demand, some lines being much more active than others. Builders' Hardware, for example, is moving sluggishly, while seasonable goods, on the other hand, are in very fair demand, comparatively little complaint being made.

Orders from manufacturers for raw material, tools and miscellaneous supplies are referred to as exceptionally light, a fact which reflects the conservative disposition which characterizes this department of trade. It is a matter of common remark that the retailers as a class are purchasing more freely than the jobbers and the small jobbers more freely than the largest. Some of the leading jobbing houses are in fact limiting their purchases to absolute requirements and prefer to let their stocks be somewhat broken to keeping them fully assorted, as is their usual practice. There is a disposition also to avoid pressing sales and much more attention than usual is being given to the matter of credits. Prices are without material modification, and while on the general line of Hardware they are well maintained, the tone of the market is not strong, and the low prices which are ruling for such staple articles as Nails and Wire tend to weaken the confidence of the trade in the stability of quotations on other lines. As a result there is an entire absence of speculative buying, and orders are limited to early and in most cases immediate requirements. It is gratifying to note that there is much less complaint in regard to collections.

Notes on Prices.

Wire Nails.—During the past week the condition of things referred to in our last report continued without important change. The volume of business has been fair considering existing conditions and most of the mills have a moderate supply of orders. Prices are without improvement on a basis of $1.30 to $1.35 for large lots at mill, the former figure being usual y obtainable. It is understood that in some cases it has been shaded.

Advices from Chicago. — The approach of winter and the prospects of the close of navigation have caused an increased inquiry for Wire Nails from various parts of the Northwest and the trade of the past week has been a little better than previously. Factories able to make shipments by lake have been especially favored by this inquiry and their reports are rather more cheerful than those of their competitors. Prices may be quoted on a basis of $1.40 to $1.45, Chicago, for factory lots. Jobbers are experiencing a good demand from their customers and continue to quote regular prices at $1.55 for small lots from stock.

Cut Nails.—The Cut Nail market is not in any better condition than the Wire Nail market. The demand is small and prices somewhat irregular and weak. The market is represented by the quotation of 95 cents to $1 for carload lots at mill, but it is not unlikely that with attractive averages and desirable orders slight concessions could be obtained. Most of the mills are limiting their production and some are shut down altogether. The feeling is expressed that there is but little ground for anticipating an early improvement in either demand or prices. Small lots from store in New York are held regularly at $1.25 to $1.30.

Advices from Chicago.—A better business is reported in Cut Steel Nails, but not enough to push the factories to any serious extent. Prices are unchanged at $1.20 to $1.25, Chicago, for factory lots, notwithstanding the advance in freight rates from Eastern points, which went into effect on Monday. Jobbers report a good business in city orders, but very little demand from the country. They quote $1.30 for small lots from stock.

Barb Wire.—There is but little doing in Barb Wire. Prices are somewhat ragged and weak. The market is represented by the quotation of $2.30 to $2.35 for carload lots of Four-Point Galvanized at mill. Small lots from store are quoted at about the usual advance.

Advices from Chicago. — The Barb Wire situation has attained a point beyond which there seems to be no improvement. Farmers are evidently not doing as much as had been expected in construction of fencing, and manufacturers' orders are consequently rather light. Carload lots of Glidden Wire are now selling at $2.50 for Galvanized, while Waukegan is quoted at $2.65, with 10¢ added for less than carloads. Ordinary Galvanized Barb Wire is selling at $2.45 for carloads and $2.55 for small lots.

Brace Screw Driver. — Goodell's Brace Screw Driver, offered by C. E. Jennings & Co., 79-81 Reade street, New York, is sold at $15 per dozen, net.

Crown Sad Irons.—The Crown Sad Irons, improved, manufactured by the Colebrookdale Iron Company, Pottstown, Pa., whose New York office is in charge of Duncan K. Major, 103 Reade street. They are sold at a discount of 60 and 10 per cent. from the following list:

No. 230, Plain polished, per dozen sets.	$24.00
No. 235, Nickel plated, " "	30.00
Extra handles, per dozen....	4.00
Extra stands, "	1.00

Glass.—There is no noticeable change in the condition of the Glass market since our last report. The limited demand for Window Glass continues, but the National Window Glass Company do not consider that the demand justifies the starting up of factories. Some of the New Jersey factories are reported as starting up, also one factory in Pennsylvania and one in Indiana. The demand for imported Glass is comparatively small, and American Plate Glass works are finishing up sufficient of the rough Glass on hand to fill orders. Quotations remain unchanged and are fairly well maintained as follows: American Window Glass, less quantities than carloads, 80 and 10 per cent. discount, f.o.b. at shipping point. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 5 per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Old Metals.— The market for Old Metals rules dull, with buyers and sellers diverging largely in their ideas of values. Prices are irregular, and quotations are consequently subject to the urgency of requirements or sales. The following are the outside prices paid for Old Material delivered in New York:

Heavy Copper	℔ 6⅝¢
Light and Tinned Copper	℔ 6¼¢
Heavy Brass	℔ 5¼¢
Light Brass	℔ 4½¢
Lead	℔ 2¾¢
Tea Lead	℔ 2½¢
Zinc	℔ 2½¢
No. 1 Pewter	℔ 14¢
No. 2 Pewter	℔ 6¢
Wrought Scrap Iron...℔ gross ton	$12.00 @ $13.00
Heavy Cast Scrap.....℔ gross ton	11.00 @ 12.00
Stove Plate Scrap.....℔ gross ton	7.00 @ 8.00
Burnt Iron (delivered at mill) ℔ gross ton	5.00 @ 6.00

Old Rubber.—Market dull and featureless. Quotations for New York delivery rule about as follows:

Car Springs, ton lots, ℔ lb. .... @	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.. .... @	.03
Rubber shoes, less than carloads, ℔ lb.....0.02¼ @	.03⅛
Large Hose, ℔ ton..... .... @	9.00
White Wringer Rolls, ℔ lb. .... @	.04¼
White Syringes, ℔ lb..... .... @	.05

Old Rags, Paper, &c.—There is only a very limited market for Old Rags, Paper, &c., paper mills being reputed as well stocked up. New York prices for these materials are about as follows:

No. 1 White Rags.....℔ lb	3¼ @ 3½
No. 2 White Rags.....℔ lb	2⅝ @ 2¾¢
Mixed Rags.....℔ lb	¾¢
Blues and 3ds.....℔ lb 1	@ 1¼¢
Hard Sized White Shavings℔ lb	2¼¢
No. 1 White Book Shavings ℔ lb 1¾	@ 2 ¢
No. 2 White Book Shavings℔ lb 1	@ 1½¢

Mixed Rope	₰ lb	¾ @	⅞¢

Trade Notes.

KUMBERGER & CLEMENT are the firm who succeed Jeffers & Kumberger, 158 West Broadway, New York, and are the agents for the White & Middleton Gas Engine made in Baltimore.

THE LUDLOW-SAYLOR WIRE COMPANY, St. Louis, Mo., have just completed a number of contracts for outside and inside decoration. Prominent among them may be noted a large wire fence of pleasing design for the Anheuser-Busch Brewing Company, St. Louis; artistic stable fittings for two large livery stables in St. Louis; elevator inclosure for the Polytechnic Building, St. Louis; this latter work being of pressed work with hammered iron leaf work, and a large number of heavy window guards for the Insane Asylum at Fulton, Mo.

BRUCE & COOK, 186 to 190 Water street, New York, are now receiving per steamer from Europe a large invoice of Russia Iron and Tin Plate, which they are prepared to offer at favorable prices. They also carry in stock a full line of Galvanized and Harvey's cleaned cold rolled Sheet Iron, Sheet Zinc, Elbows and a full line of tinners' supplies. They likewise make of their own manufacture a special brand of Solder, which they offer at advantageous figures. Plumbers and tinners who have used it are well satisfied as to results.

THE NEW YORK PEANUT ROASTER WORKS, at 226 Hudson street, New York, make a specialty of Tanney's Patent Peanut Roaster, which is made in several sizes and widely sold.

THE MYERS PUTZ POMADE COMPANY, 144 High street, Boston, Mass., have been appointed sole agents in the country for Putz Extract, a preparation for polishing bright metal goods, which is manufactured by Fritz Schulz, Jr., Leipzig, Germany.

THE SHEET-IRON SHOP of Geo. A. Suter & Co., 139 South Fifth avenue, New York, is busily engaged on the work for some large heating and ventilating plants.

Twenty-eight men were drowned on September 29 in the Mansfield Iron Mine in Michigan, through the waters of the Michigamme River breaking through their bed, weakened by the mining excavations below. The Mansfield Mine is situated about 6 miles from Crystal Falls, the capital of Iron County. It has been worked for four years, and has shipped about 660,000 tons of Bessemer ore. The mine is one of the few which have been worked continuously during the recent depression.

In a paper in the current issue of the *North American* Mayor Gilroy of New York estimates that the value of the city's property has grown from $277,000,000 to $559,000,000 since 1871.

Burning Gas Coke.

From the address of President M. P. Mallet before the Société Technique du Gaz, recently held in Paris, we print the following extract bearing on the use of gas coke in domestic fires:

As to coke, it is the most remunerative of the by-products; in some cases the money got for it is fully half that received for the gas. Thirty years ago we could not possibly have got rid of the quantities we now regularly dispose of. Very little was used in houses; it was not generally understood how to burn it there; and even industry hesitated about it, save as an inferior fuel. Since then it has come greatly into domestic use; proper apparatus has come into general use; the Paris Gas Company have done a great deal in this direction; slow combustion stoves have come greatly into use, one firm in Paris having made 175,000 within the last five years. The Marseilles Gas Company, who have metallurgical works of their own, use 10 000 tons a year in these, or about 40 per cent. of the total coke used. In the department of the Loire some blast furnaces use gas coke to the extent of 30 per cent. of the whole. The four railway companies which come into Paris use from 75,000 to 80,000 tons a year for their locomotives, in the suburbs. Gas coke is also used by large metallurgical works in their gas producers; it is also much used for forge fires, and also for raising steam.

Coke dust is ceasing to be a vexation to us; we are learning now how to burn it and how to gasify it. The Godillot system and the Robin system enable us to do this. M. Robin has installed in Paris alone 500 of his coke dust stoves for heating public or private buildings, and 1400 elsewhere. And even in steam raising, coke dust is regularly being used, up to 70 per cent. of the fuel, by means of wide hearth bars, very close together. The Société is to visit the Say refinery, where there are 68 boilers, with a heating surface of 171,560 square feet, in which this is being done. Coke dust has therefore a market before it.

The use of coke has, to some extent, wakened up the use of anthracite. The stove which will burn coke will generally burn anthracite, which is now found used in such stoves. But fortunately for us anthracite is very dear; it costs in Paris $10 a ton.

Although hot water pipe stoves take a good deal of coke dust, still all arrangements which to do away with heating of individual rooms are opposed to the sale of coke, since the stoves can burn any cheap fuel. But such methods are only coming in slowly, and in houses of great size, or in large buildings.

The greatest adversaries of the use of coke are ourselves, through the zeal with which we push the use of gas for heating. Already half the coke we sell in Paris goes to manufacturers. It is desirable rather to push its use in domestic heating, else we shall some day fail to get our prices for it. In country towns the use of coke is very little known. There is no reason why this should be so. In Brussels the consumption of gas coke per inhabitant was three times as great in 1891 as in 1886. Where coke is not known it might be sold at as reasonable a rate as possible, at any rate for a time, until the use of it had been understood. It is even better that the inhabitants should have their coke somewhat cheaply than that the same money should be thrown away in benefiting commission agents and railway companies. The coke must, of course, be broken for domestic use. It is bewildering to find some works actually sending it out for house use unbroken. And it must, of course, be kept dry; it must not get wet. We must make people acquainted with the existing apparatus for burning coke. Our Belgian brethren are on the alert, and have instituted a competition for the best apparatus for burning coke. Some good results will, we hope, follow. But even now the apparatus is good, and it is for us to bring it under people's notice by all the means which are necessary to insure publicity. And we ought to lend them coke stoves in the same way as we have so successfully lent gas stoves.

A Modern Factory Building.—The building in course of erection for the Diamond Machine Company of Providence is in many respects the finest edifice of the kind in that city. The land upon which it stands has a frontage of 450 feet on Atwells avenue, a depth of 350 feet on Kingsley avenue, bounded on the north and east by the Woonasquatucket River, leaving ample and sufficient accommodation to erect further buildings of this class when they are required. The building is 205 feet long, 60 feet wide, is set 12 feet back from the street line, built of brick and granite, foundation stone of the very heaviest material, foundation walls 4 feet thick, granite underpinning 23 inches deep, 8 inches wide, 1½ wash, brick wall on the first floor 24 inches, on the second 20 inches, on the third 16 inches. Height of stories 14 feet from top of floor to top of next floor. The floor beams 10 x 16 of Georgia hard pine, all floors covered with 4 inches spruce plank, with the top floor 1-inch maple, tongued and grooved. There is no basement under the building. The latter is filled up with coarse gravel, made thoroughly compact by wetting down with water, then concreted on top, upon which rests 4 inch spruce planks with 1 inch top maple. The windows are 11 feet high, 5 feet wide, arched and arranged with transoms at the top to secure good ventilation. The floor beams 10 x 16, stand 9 feet apart, are supported by posts on the lower and upper floor, 10 inches diameter, the latter turned round, bored through the center to prevent checking, with two coats of linseed oil upon them. These posts are supported on granite underpinnings 4 feet square, which rest upon foundation walls extending 11 feet below the floor. There will be three sets of double doors for machinery and two end doors for the operatives, one on each floor at the rear of the building. The machinery doors are 11 feet high, 7½ feet wide, 3 inches thick and paneled. There are no chimneys in the building, which is to be supplied with modern sprinklers. Two sets of stair cases with maple treads, 2 inches. Norway pine partition stock, 2 inches. The building will have a gravel roof 5 ply, first 3 ply, of the best Beaver brand and a wash on top of that, covered with Oyster Bay white gravel.

There are two lines of shafting on each floor, elevators for hoisting purposes. The factory is to be lighted by electricity. The power is supplied from a separate building of brick and granite, erected upon their land (40 x 50) where engine boiler and blacksmith shop are contained. A 75 horse-power engine with 100 horse-power boiler is to be used. It is designed by the builders to secure a strong rigid building with strength sufficient to meet every requirement in the business, perfectly lighted and ventilated, protected from fire by all modern improvements.

According to Commodore Ramsey, Chief of the United States Bureau of Navigation, the recent Columbian naval review, entailing the prolonged presence of many American war vessels in home waters, was responsible for an unusually large number of desertions from the navy. During the year ended September 30, 1259 men and boys deserted, of whom 1079 went ashore in the United States.

News and Notes.

The Hydrographic Office of the Navy has received information respecting 20 derelict vessels, wrecked during the hurricane of August, which have been seen along the Atlantic Coast from Maine to North Carolina, presenting a serious obstruction to navigation. Steps for removing the vessels are in contemplation.

The recent epidemic of train robberies has induced the managements of some Western railroads to arm their employees with rifles; and express companies will in future use additional precautions to protect the valuable property forwarded by them.

A Philadelphia safe deposit company are about to build a chain of warehouses on the Delaware River front of the city at a cost of $1,000,000, which, it is said, will give Philadelphia the best storage facilities for merchandise of any city on the Atlantic Coast.

A new weekly steamship service is about to be established between Philadelphia and Liverpool, by the Johnson Steamship Company of England in competition with the American line of steamers, which has maintained a service between the two ports for the past 20 years.

Since the opening of navigation the Erie Canal has brought from Buffalo 34,400,000 bushels of grain, compared with 21,000,000 in 1892 and 24,000,000 in the previous year. The growing importance of the canal is evident from the fact that this year it is carrying about 40 per cent. of the grain traffic, where last year it carried but 25 per cent.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

New York Trade School.

Preparations are being made at the New York Trade School, First avenue between Sixty-seventh and Sixty-eighth streets, for the opening of the session of 1893-94, on Monday next, the 16th inst. The registration of candidates commenced on October 2, since which date nearly 200 applications have been received for a course in the various evening classes. Probably this number will be considerably augmented on the night of opening. As usual, candidates for instruction in the plumbing classes far exceed those in any other trade, comprising about one-third of the total number of applications. The popularity of the school shows no signs of abating, and the attendance this season will, it is estimated, fully equal if it does not exceed that of last year. The day classes do not begin their curriculum until January 2. Evening classes, commencing on Monday, include those for instruction in plumbing, bricklaying, stonecutting, carpentry, painting and blacksmithing. During the summer the school has received visits from a number of Americans and foreigners interested in trade education who displayed great interest in the arrangements of the institution and the system of training followed. Among the foreign visitors were Professor Dr. Gustaf Retzius of the University of Stockholm, Sweden; M. Kuru, Japanese Government Architect and Commissioner for Japan at the World's Fair; William Gillies of Mico Institution, Kingston, Jamaica, W. I.; W. Pick, Parisian delegate to the Columbian Exposition, and Theodore Richards and Rev. C. M. Hyde, trustees of the Kamehameha Manual Training School, Honolulu.

Something Wanted in Stoves.

Since processes of enameling cast iron have become so common, and have been brought to such a state of perfection, why is not possible to apply some kind of enamel to the tops of cooking stoves and ranges, so as to emancipate housewives from the so frequently recurring and extremely disagreeable task of blacking stoves? Such an improvement would be immensely popular if it could be supplied at moderate cost and be made so durable as to wear during the life of a stove or range. Of course, the enameling of all parts would be desirable, if it could be done without a too great increase of cost. The tops of stoves are particularly mentioned, because the top being exposed to the highest degree of heat does not long retain a coat of blacking, and, in order to be kept looking nice, requires almost daily attention. It is safe to say that scarcely any kind of domestic work is more repugnant than stove blacking. Yet good housekeepers have such a horror of the reddened, blotched and unsightly appearance of a neglected cooking stove or range that they impose upon themselves the frequent task of blacking and polishing, in spite of its disagreeable nature. Probably black would be the color preferred for such a finish as is herein suggested, but, except that it would seem rather odd at first, the gray color of the enamel familiar now in enameled ware does not appear objectionable. Probably some difficulty would have to be encountered at first in obtaining enamel sufficiently resistant to heat; but in view of what has already been done a solution of the problem does not seem hopeless.

The Traveling Salesman.

The best commercial friend that the retailer has to-day is the traveling representative of the manufacturer or jobber. The time when the buyer went to the seller has long since passed, and the present system of traveling salesmen is of decided benefit to the dealer. It is much easier to obtain low quotations when one stands behind one's own counter and is asked to purchase by the commercial traveler than is the case if he visits the wholesale establishment and makes known by his presence his need of goods. Then the terms are more satisfactory, for the dealer can exert a personal influence upon the salesman which would have little effect if he were not standing in the midst of his own business and extending his patronage rather than asking for credit. There is a recognized personal appreciation of the value of the trade, which exerts a marked influence on the decision of the salesman as to both prices and terms. The salesman not only desires to sell the goods in the interests of his employers, but he also is ambitious to increase his sales in order to satisfy his own ambition and reputation as a successful salesman. No matter how humble the dealer he will invariably receive at the hands of the traveling salesman an amount of consideration which he could never expect were he to visit the factory or warehouse. The salesman knows that to succeed he must be courteous, well informed and fair in his dealings, and the dealer, therefore, is treated with respect and his interests protected, because the salesman recognizes that an honest policy will hold his customer.

Giving Information.

Another way in which the traveling salesman exercises his friendly offices to the retailer is in the matter of keeping the dealer posted as to changes of styles, variations in value and improvements in goods. The salesman is well aware that to hold the interest of the dealer he must be the first to show him a sample of the latest fad or device. He must be the first to notify him of the decline or rise in prices, and the first to warn him of the public change in favor of some new fashion or method to which the dealer may cater. The salesman at stated and regular periods visits the store of the dealer with his valise or trunk, and, after some general conversation as regards business news, asks permission to display the samples of his line of goods. The relative values of each article are clearly described and their uses explained if necessary, and a comparison given in an intelligent manner of the competing goods on the market. The dealer by this means has an opportunity to learn many valuable points about the goods, and is afterwards able to better describe their values and uses to his own customers. The man who "knows it all," or the man who knows enough about the details of his business is yet to be born, and it is, therefore, a matter of no small importance to the dealer to educate himself in all directions.

Watching the Dealer's Interests.

After the samples have been exhausted and the dealer has selected his purchases and given the order, the salesman feels it his duty to see that proper instructions are given as to shipping, packing, &c., and is solicitous that the order shall reach his customer on the dates and conditions specified. On the other hand, should the dealer see fit not to order, the salesman will accept the verdict in a proper spirit and leave with a hope of future business relations. These remarks are of course in regard to the conduct of the successful salesman. There is no

doubt still some cross-grained and tricky men who act as representatives of wholesale houses, but their number is decreasing. The successful salesman of to-day must be a gentleman, not only in appearance and manners, but at heart as well. He must feel the responsibility of his position and merit the confidence of the trade. It is not a matter of sentiment; it is a cold fact of business dollars that fair treatment and honest statements win the race.

Railroad Construction in 1893.

An interesting statement with regard to railroad construction this year is made by the *Railway Age* of Chicago. The total new mileage laid during the first nine months of the year, as obtained from official sources, was 2040.85 miles. Ordinarily, at least 50 per cent. more track would be laid during the remaining three months, but from the present outlook it is regarded as doubtful if the total for the year exceeds 2500 miles. Details of the track laid in each State or Territory for the nine months are as follows:

Track Laid in First Nine Months of 1893.

State.	Lines.	Miles.
Alabama	5	46.
Arizona	1	42.
Arkansas	4	12.75
California	7	64.32
Colorado	2	16.76
Florida	7	103.50
Georgia	6	62.50
Idaho	1	5.57
Illinois	7	64.80
Indiana	5	21.10
Iowa	1	4.
Kansas	1	18.45
Kentucky	5	25.50
Louisiana	3	8.25
Maine	2	71.50
Massachusetts	2	11.13
Michigan	1	0.50
Minnesota	4	42.21
Mississippi	1	3.
Missouri	7	139.95
Montana	1	27.
Nebraska	2	32.70
New Hampshire	1	1.
New Jersey	1	2
New Mexico	1	2.54
New York	6	31.39
North Carolina	8	69.60
North Dakota	2	194.60
Ohio	5	134.70
Oregon	1	11.50
Pennsylvania	43	364.05
Rhode Island	1	5.21
South Carolina	1	14.
South Dakota	2	62.06
Tennessee	3	17.30
Texas	6	140.82
Utah	1	9.
Virginia	5	16.64
Washington	2	41.90
West Virginia	14	76.05
Wisconsin	3	19.
Wyoming	1	4.
Total in 42 States and Territories	182	2040.85

If the estimate for the year proves correct, and the total new track laid does not exceed 2500 miles, the year 1893 will show a retrogression in this respect to the conditions obtaining in the period from 1874 to 1878, when the new track laid ranged annually from 1711 miles to 2712 miles. From present appearances the estimate will not be exceeded, as the rail mills of the country are all idle or running only spasmodically on very small orders, and if there was any considerable length of track to be laid during the fall and early winter this would not be the case. Taking the condition of the country's finances the past summer, it is rather surprising that even this much work has been accomplished in new construction. It would have been in entire harmony with the general wreck of business if all such work had been completely stopped. Its continuance under such discouraging circumstances excites the hope that as soon as the disturbing elements now interfering with commercial interests are out of the way there will be considerable activity in this direction.

Railroad building has not been overdone in recent years, and there are numerous deserving projects for new lines and extensions that are only waiting propitious times to be launched on the financial sea. There was a sudden dip downward in railroad construction in 1885, when the new mileage fell slightly under 3000 miles in consequence of financial disturbance, but it was followed by a quick recovery the next year, when over 8000 miles of new track was laid. While the panic of 1884 which caused that depression in railroad building was by no means so serious as the recent crisis, still the nation's recuperative power at this time ought to be fully as strong if not stronger, should wisdom rule in pending national legislation. The currency and tariff questions should be settled speedily. With these out of the way, no longer menacing business of every description, new enterprises in railroad building as well as in other lines would again be undertaken and new vitality would be imparted to our languid manufacturing interests.

Franklin Institute Lectures.

The programme of the 1893–94 course of lectures in connection with the Franklin Institute, Philadelphia, has just been issued. These lectures, which are on subjects of a scientific and technical character, are given each year on Friday evenings, beginning in November and ending in March. Admission is by members' tickets, members being also furnished with admission tickets for their friends. The lectures this season will number about 20, opening on November 3 with one by Prof. Edwin J. Houston on "A Plea for the Study of Forestry in the Lower Schools." Other interesting lectures on the programme are Horace Pettit of Philadelphia on "The Law of Inventions;" C. J. Hexamer on the "Evolution of the Workshop;" Prof. G. P. Merrill of the Smithsonian Institution on "Building Stones of the United States;" Prof. Elihu Thomson on "Induction Coils and Condensers;" W. N. Jennings on "Snap Shots at the Fair;" O. Chanute, C.E., of Chicago on "Aërial Navigation;" Professor Crocker of Columbia College, New York, on the "Electric Motor;" Henry R. Towne of Yale & Towne Mfg. Company on "American Bank Locks and Fastenings;" Rudolph Hering of New York on the "Purification of Water;" T. Dunkin Paret of the Tanite Company on "Emery and Other Abrasives;" Thos. D. Whitaker on "Portland Cement," and Prof. Edward Hart of Lafayette College, Easton, Pa., on "Carbon."

News and Notes.

The latest Cunarder "Lucania," which on her initial trip from Liverpool to New York beat all previous maiden records by a run of 5 days 15 hours and 37 minutes from Queenstown to Sandy Hook, made her second westward trip last week in 5 days 13 hours and 25 minutes, thus breaking the best former record—that of the American liner "Paris"—by 59 minutes. The chief engineer of the "Lucania" believes that she has not done her best yet, and that she may be relied upon to still further lower the time of transit by several hours.

Cuban papers contain complaints of a great dearth of good field laborers.

Some important shipments of anthracite have been recently made to England, and inquiries are noted for quotations on American coal from Mediterranean and other foreign ports, where the difficulty of obtaining adequate shipments from Great Britain since the strike is being severely felt.

Improvements proposed by the Dock Board on the North River front of New York from West Tenth to West Twenty-third streets comprise 19 large piers, 80 feet wide and ranging from 466 to 729 feet in length, with a distance between each pier of 225 feet, thus allowing two steamers to unload at the same time. The inside cost of the undertaking is placed at $11,000,000, but this would probably be materially increased if the whole scheme is carried out.

In the United States Circuit Court of Philadelphia on October 7, an injunction was obtained by the Edison Electric Light Company against the Westinghouse Light, Heat & Power Company for alleged infringement on incandescent lights.

Cuban sugar planters expect that the yield of next season will be a heavy one, and will enable them to retrieve the losses of last season, always provided that no cyclone visits the island during the present month. The appearance of the cane fields throughout the sugar region is described as very promising.

In illustration of the improvement which has developed recently in railroad freight traffic, the Philadelphia *Times* remarks that a few weeks ago the Pennsylvania Railroad had 16,000 idle freight cars standing along its various sidings. Reports received a few days ago showed that the number had been reduced to 6000. What is true of the Pennsylvania is also true of the Lehigh Valley. Hundreds of its freight cars which have been lying idle for months back on the coal region side track are now reported as in demand for Western coal and grain traffic, and all the empties have been ordered for inspection, preparatory to forwarding them West.

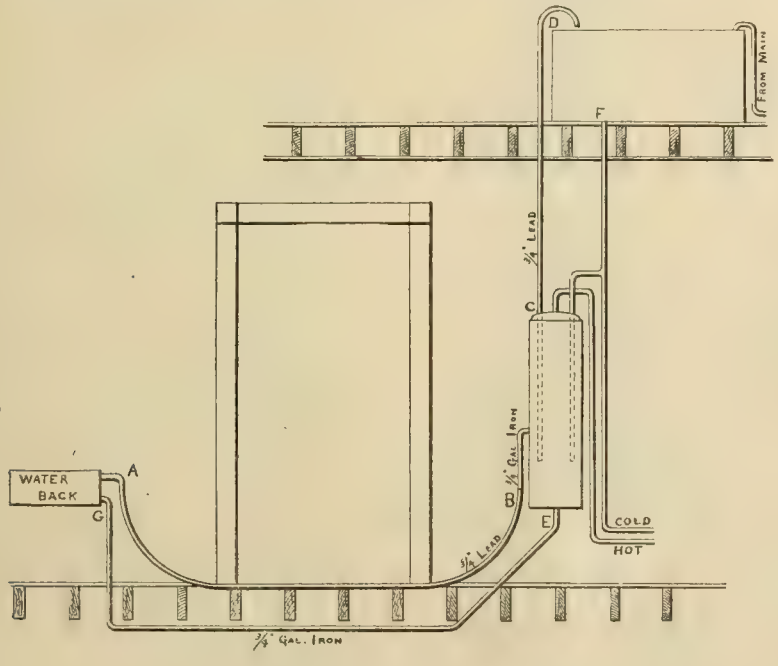
Business in Havana is reported as paralyzed, owing to the refusal of the customs authorities to accept bank notes in payment of duties.

The opening of the Manchester ship canal, which is announced for January 1, 1894, will enable cotton steamers to land their cargoes close to the mills, thus saving railway freights and the expense of handling on the other side. The canal is likely to make Manchester a formidable rival to Liverpool as a British port of entry.

THE LETTER BOX.

Water Back and Boiler Connection.

From G. E. M., *New Hampshire.*—I wish to obtain, through *The Metal Worker*, information concerning a range boiler which has given much trouble. The boiler is of copper, installed and piped as shown in the accompanying drawing. The water will not heat in the boiler. Can you give the reason and remedy? The circulation will occasionally start and continue for from five to thirty minutes and then stop. Sometimes the cold water pipe from boiler to water back will be warm. Occasionally the relief pipe C D will overflow, and at times there appears to be a blowing



Water Back and Boiler Connection.

back from the cold water supply pipe in the tank at F. The arrangement of boiler on one side of the door and the range on the other is the best I can do. The pipes A B and G E were placed below the floor because of doors and windows preventing their being carried around the room.

Note.—We have reproduced our correspondent's sketch. From the relative position of the boiler and water back, we think there will be little difficulty in presenting the reason for the imperfect circulation. The trouble is due to carrying both the pipes below the door. If circumstances are such that the position of these pipes cannot be changed, we are at a loss to know how our correspondent can get over his trouble. If the pipes, however, can be altered, we would suggest that the pipes A B be carried over the doorway and connected near the top of the range boiler, while the pipe G F might be brought up to the position at present occupied by A B where it goes under the door. We presume, from what our correspondent says, that the boiler cannot be changed, but if there is any change possible in the matter we would suggest that the most effective remedy would be to bring the boiler to the other side of the door next to the water back. If our readers have any suggestions to make, we would be glad to hear from them.

Difficulty with Pipes from Spring.

From J. F. S., *Washington, D. C.*—Having read the request of "A & S." of Owego, N. Y., in *The Metal Worker* of September 30, and your remarks on it, I would say if they leave the faucet open at the barn, the fall of the pipe will syphon the water from the pipe in the house. If they stop the faucet from running at the barn they will have water at the faucets in the house.

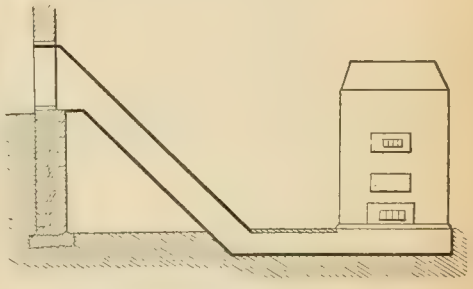
"Necessity" Pipe Union.

From J. W., *Greencastle, Ind.*—I note the article "Withholding Information" in *The Metal Worker* of September 16 and fully believe that an interchange of ideas by members of a craft may help some out of a hole who would be very grateful to the giver of the idea.

I send you a description of a wrought iron union pipe joint that I have named "Necessity," as that was the condition under which the idea was born. To make "Necessity" cut a long thread on the pipe so as to let the common socket run back flush with the end of the pipe. Then take a drift pin that is of the same pitch as the die that cut the thread and the tap that threaded the socket, and expand the pipe inside of the socket. Then bring the end of the other pipe up and back the socket off the long thread on to it. Backing off against a pitch and going forward against the pitch of the thread will, if rightly prepared, make a tight joint. Service men of gas companies and steam fitters will find "Necessity" their friend.

Two Styles of Air Ducts.

From J. H. T., *Meadville, Pa.*—I wish *The Metal Worker* and its practical readers to give their opinion as to



Two Styles of Air Ducts.—Fig. 1.—*With no Right Angle Turns.*

the advantage, if any, of running the cold air duct on a slant from the mouth to the furnace, as in Fig. 1, instead of letting it run down perpendicularly to a trench that runs to the furnace, as shown in Fig. 2. I contend that there would be no difference between the methods, so far as the air supply is concerned. I am setting a furnace for a customer as shown in Fig. 2, and he is very pronounced in his opinion as to this way of arranging a cold air duct. He predicts all manner of evil for it, and says it will not work and he will not have it. He says the furnace will not get a sufficient air supply with a perpendicular duct with a right angle turn in it. He has been to see me with his war paint on, and to prove to me

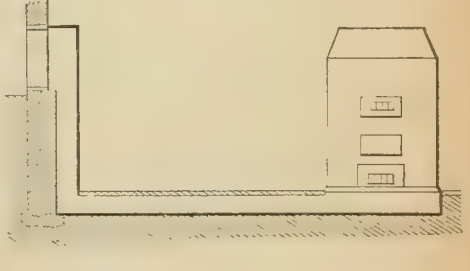


Fig. 2.—*The Usual Style.*

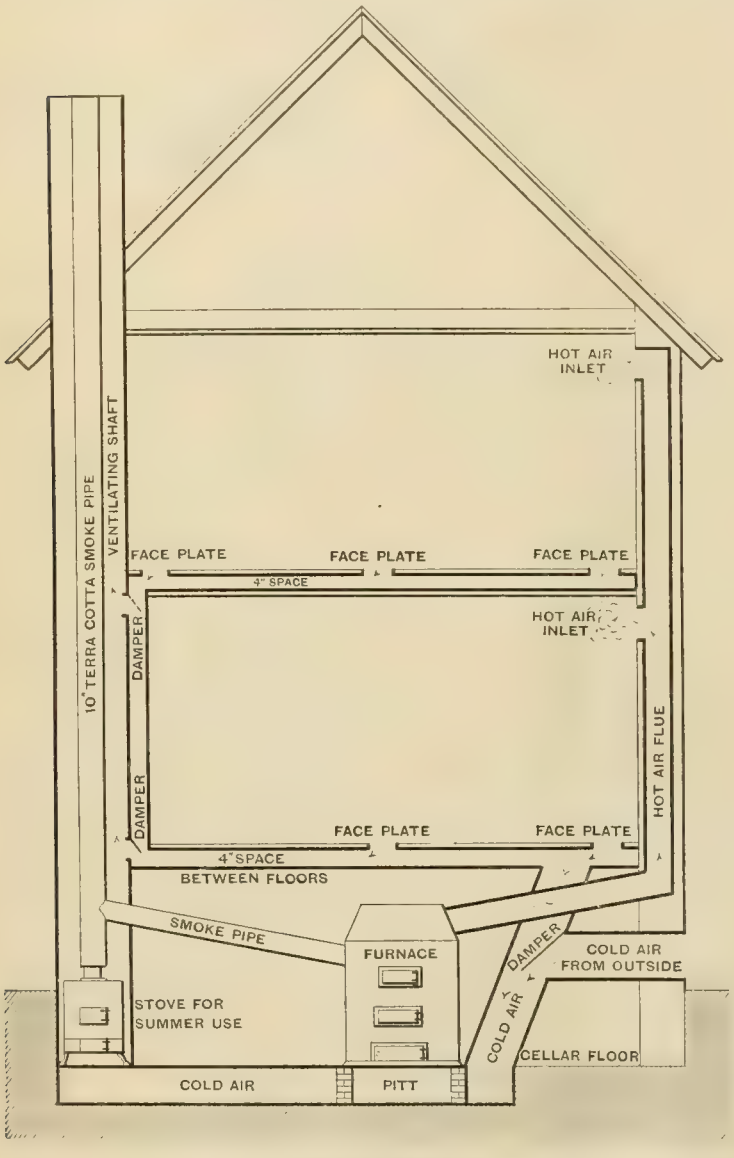
that it would not work he said he had held a burning match in the furnace pit and the air current did not blow it out. There has never been any fire in the furnace yet.

Note.—This appeal to our readers will no doubt receive the attention to which it seems entitled. The advantage to be gained by following the plan in Fig. 1

is insignificant and is not worth any extra trouble. Any deficiency in the air supply will result from lack of capacity rather than the plan of constructing the duct. The duct should have ample capacity and should be air tight so that the entire pressure will bear on the air that is heated and rising in the furnace. A damper in the duct will readily reduce the supply when it is too great. No doubt our correspondent can take his customer to many places in his city where satisfaction attends the use of a duct such as he has provided. In *The Metal Worker* of March 18 and April 1 he will find illustrations and descriptions for building ducts on the plan he has used.



A Heating System.

A Heating System.

From G. P., *Victoria, B. C.*—I inclose you a rough copy of my plan for heating and ventilating a school house, and would like your opinion of it and that of your readers.

Note.—No description coming with the sketch, some desirable information is lacking from which to form an opinion. The idea conveyed by the sketch has considerable merit, and if properly carried out in detail the work should prove satisfactory. The damper in the cold air box is so arranged that the outside air can be temporarily shut off, and by closing the ventilating registers at the same time the air will circulate through the building and furnace until the desired temperature is reached. The registers should then be opened and the damper arranged to take air from out of doors. A janitor in charge of such a system should have strict orders never to run it on the circulating plan when the school is in session. It is improbable that so many face plates will be needed in the floor, and the registers connecting the exhaust ducts with the ventilating flue should be properly proportioned in size to the heating registers. The necessity of the stove in the ventilating flue may or may not be felt. As our correspondent suggests, the plan is subject to further comment.

Boiler Connections.

From S. H. D., *Watkins, N. Y.*—I notice a good many suggestions in *The Metal Worker* as to the proper manner of making range boiler connections. Allow me to say that if a boiler is treated the same as a hot-water radiator and the connections made in accordance with the rules for hot-water heating the boiler can be placed anywhere in a building that a radiator could be placed with good results. The circulating pipe must be kept separate from the supply and distributing pipes. I have placed boilers in many strange and unusual positions, and have never failed in a practice covering many years to get good circulation.

Filtering Air Supply for Furnaces.

From CÆSAR, *Louisville, Ky.*—Filtering the air supply for furnaces depends altogether for its success on the situation. The use of cheese cloth on outside opening where the duct is in direct connection with furnace and outside opening is found to be very costly in numbers of cases for the reason that those in charge neglect to replace the cloth often enough, and the result is that the furnace and casing are ruined, besides the danger from fire resulting from an overheated furnace. It is found that under such conditions not less than 50 per cent. more air duct must be provided than is actually required by the furnace. The cloth should be renewed at least once every week, and if in a very dirty neighborhood twice a week. In such cases it is often difficult to get the best results. This is the case only when cheese cloth is used. The best results I have ever had are under the following conditions: When there is a good sized cellar, a cold-air room is constructed. The air duct from furnace is run underneath the cellar floor into cold-air room on the opposite side from the inlet for outside air. The mouth of this duct is raised not less than 5 feet above floor of cold-air room; in this box is placed the adjustable slide damper, and below it three slide frames covered with No. 18 or 20 wire cloth. The space in cellar between this box duct and outside opening is spanned by a number of wires, and these wires are hung with cloths of loose woven material reaching near the floor. It is a well-known fact that where soot comes in contact with cloth of any kind it will deposit a certain quantity with every contact. The wire screens should be cleaned with a broom at least once a week. I have found this arrangement to be the best that I have tried so far. To get the best results the cold-air room should be large enough to stretch a number of lines hung with the cloth strips.

Enameling Iron and Steel.

From S. H., *Massachusetts.*—Please inform me through *The Metal Worker* how enameling on steel and cast iron ware is done, or how granite ware is manufactured. Is there a patent on either of these processes?

Note.—The receipt books give various formulæ for enameling on iron, but we are inclined to believe that the process for the satisfactorily enameling of iron is not so easy that one can learn it by reading an article in a book. The various firms in this country who make enameled ware have their special processes for doing so. There is a double difficulty involved in the work. First it is necessary to get an enamel that will give satisfactory results, one that will be hard, impervious, unaffected by acids, and what is probably the most difficult of all things to obtain, an enamel that will expand and contract

with the metal itself, so that it will not crack off under changes of temperature. Granite ware is made by one firm, and, we believe, depends particularly on the preparation of the black metal, the effect of which is to give a mottled appearance to the finished article. A great deal of money has been spent in learning the process of enameling by the different manufacturers, and naturally they are not anxious to tell all that they have learned from experience and from the experience of others. Among the largest enamelers in the country are some who have worked out the process for themselves by a long series of experiments. This necessarily involves the expenditure of a great deal of money and a great deal of patience. If our correspondent, however, wishes to experiment for himself in this line, he might consult any of the well known receipt books, and, starting with their instructions as a basis, work out for himself a satisfactory application of the process.

Cleaning Foundry Windows.

From H. W. W., *New York.*—In answer to the query of "Iron Founder," in *The Metal Worker* of October 7 for some process of cleaning foundry windows, the following is given as having been found satisfactory in many large foundries and machine shops: A handful of oxalic acid to a pail of water. An important feature of the cleaning is to go over the glass with a woolen rag or soft skin and give it a polish, which will prevent dust collecting as quickly as it otherwise would. Glass cleaned and polished in this way will stay clean for a longer time than if left unpolished.

From IRON FOUNDER, *New York.*—In answer to the inquiry of "Iron Founder" Chicago, in *The Metal Worker*, I have used dilute sulphuric acid followed by a scouring with a mixture of fine sand and soft soap for cleaning foundry windows. I have seen windows that were very rusty and dirty made quite presentable in this way. While I do not consider this a positive success I know of no process which is better.

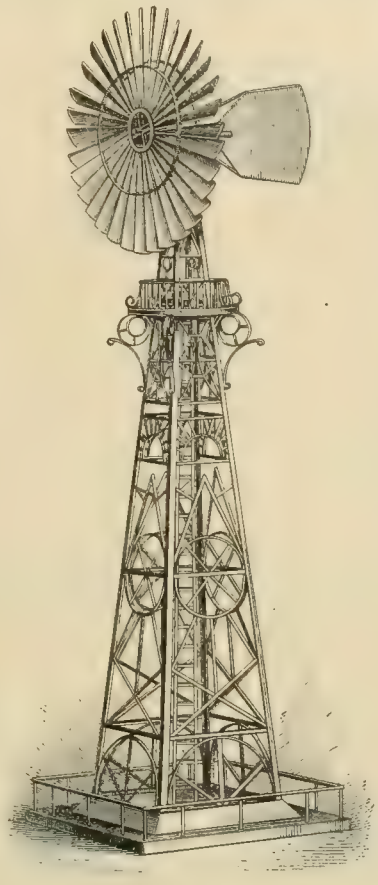
From CÆSAR, *Louisville, Ky.*—In answer to "Iron Founder" in *The Metal Worker* of October 7, the windows of a foundry may be cleaned quickly and perfectly by using parting sand (sand that is brushed off the castings) mixed with a weak solution of sulphuric acid and water. Brush this over the glass and allow it to remain for a few minutes, then finish with more of the same mixture. I have used this method of removing the oxide of iron and emery from the windows of the polishing room and foundry for years with success. The acid softens the iron, which is removed by the friction of the sand.

Water Heater for Cattle.

From HENRY H. LOVELL, 308 *Lugrare street, Grand Rapids, Mich.*—I notice the inquiry of "O T. B.," Clinton, Mass., in *The Metal Worker* of September 9 in regard to water heaters for stock. I have made three and own the patents on the same. They work well and are good sellers. I should be glad to hear from your correspondent.

Tin Wind Mill.

From A. S. CAMPBELL, *Cedartown, Ga.*—I send to *The Metal Worker* a photograph of a wind mill which I built recently. It is made entirely of tin, except the base, which is a board 19 inches square covered with tin. It stands 5½ feet high to the top of the wheel, which is 19 inches in diameter. The tower is 12 inches square at the base and is 4 feet 8 inches high. A ladder is built inside of the tower, up to the platform. The wheel operates exactly the same as a large one and works with a very light breeze.



Tin Wind Mill.

Note.—From the photograph sent the illustration given has been made for the benefit of our readers, as it shows a very clever piece of workmanship.

Gas Tar for Roof Paint.

From G. M., *Camden, N. J.*—Please inquire of "E. E. P.," New Haven, Conn., whose communication appeared in *The Metal Worker* of October 7, or examine the sample piece of tin sent to you, and see if it has a coat of some other good paint under the coat of tar that would prevent the acids of the tar from reaching the surface of the tin. It seems to be reasonable that if the smoke and gases arising from soft coal have the effect to rust out the tin from the under side, the gas tar made from the same material should have the same effect on the top side. I know from experience that pitch preserves tin, but not gas tar.

Note. — Close examination of the sample and scraping discovers no paint under the tar, which is thick and tough, with the tin in good condition.

What Size Boiler?

From C. E., *Paterson, N. J.*—Will *The Metal Worker* please let me know what horse-power horizontal tubular boiler will be required to heat a school building 74 x 105 feet, that is exposed on all sides to the weather and has 7000 feet of glass surface?

Note.—A heating engineer would require more information before attempting an answer. However, to give some idea of how to arrive at a conclusion, what is deficient has been assumed. A building 74 x 105 feet, with 7000 feet of glass surface, would probably be three stories high and have ceilings that would give the building a hight of at least 40 feet. Such a building would contain 310,800 cubic feet, and figuring on 1 square foot of radiating surface to heat 100 cubic feet of space, 3108 square feet of radiating surface would be required unless the air in the rooms was to be changed frequently, when more would be required. Some authorities say 1 square foot of boiler surface will be required for every 5 square feet of radiating surface, so by dividing the 3108 by 5 it is found that 622 square feet of boiler surface will be necessary to do the work. The same authorities say that 16 square feet of boiler surface for heating are equivalent to 1 horse-power, so by dividing the 622 by 16 it is found that a boiler of about 40 horse-power will be required for the assumed building. We are aware that the cubic contents rule is not at all reliable, but our correspondent has not furnished sufficient data to calculate the boiler capacity on a basis of glass area and exposed wall.

Check Valves and Steam Heaters.

From INQUIRER, *New Jersey.*—Will you kindly give the readers of *The Metal Worker* a half column touching the use of check valves on ordinary domestic steam heating plants? Are they necessary? Are they necessary sometimes? Why?

Note.—An opinion seems to prevail at present that a check valve is unnecessary in a well erected heating plant—that is, one that has a positive pitch or inclination from the boiler to some point and from that point to the boiler. In the past it was the custom, still followed by some, to use a check valve on the return to the boiler, then in case of an air pocket or a rapid condensation creating a vacuum, or too rapid a reduction in the size of the mains, a pressure in the boiler could not drive the water out of the boiler up the return. An objection to the check valve is the possibility of its becoming shut fast from corrosion, and many practical men do not use them on their work. We will be glad to hear from our readers on this topic.

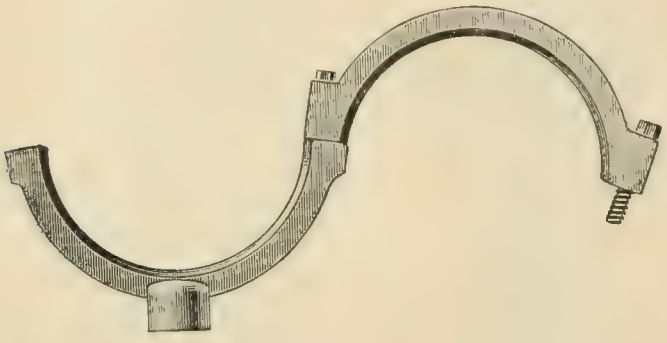
Tempering Small Springs.

From J. C. D., *Dyson, Ohio.*—What is the best way to temper small springs? Will some of the craft please answer through *The Metal Worker*?

PLUMBING and GAS FITTING.

Netherland Pipe Hanger.

The illustrations herewith show a pipe hanger invented by Alexander Bryant and put on the market by the John Simmons Company, 106–110 Centre street, New York. It was first used by Macdonald & Co., in the Hotel Netherland, New York, where the screw joint system of wrought iron pipe was employed for drainage. The hanger consists of a casting in two parts,



Netherland Pipe Hanger.—Fig. 1.—Showing Manner of Fastening.

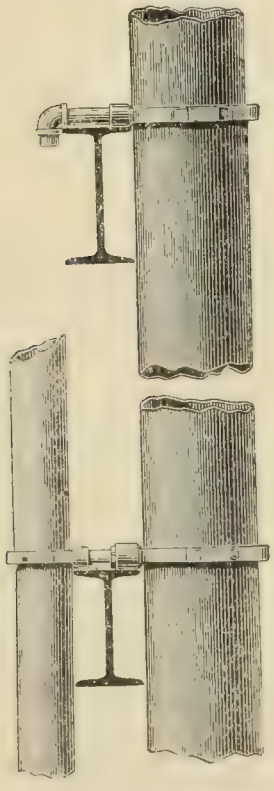


Fig. 2.—As Used with Girders.

as shown in Fig. 1, joined by set screws. An enlargement on one part of the hanger is drilled and tapped for iron pipe from ⅛-inch to 1¼-inch, according to the size. This enables sand hole fittings and short pieces of pipe to be worked up profitably. The hanger can be used to meet almost any requirement through the adaptability of pipe and fittings to various conditions. It will support or suspend the pipe or hold it at an angle from wood work, masonry or iron girders, as shown in Fig. 2. It is made in malleable iron for pipe from ⅛-inch to 4-inch and in cast iron from 3-inch to 6-inch.

The Leading Principles of Scientific House Drainage and Sanitary Plumbing.

BY WM. PAUL GERHARD, C. E.

The first principles of scientific house drainage and plumbing work are now well understood and little may be said on the subject that might appear new. Sanitary house drainage has been repeatedly and exhaustively discussed by leading sanitarians, yet the writer feels that—even at the risk of repetition of what he has said in former writings—the principles of safe sanitary drainage cannot be too often tersely stated.

There appears to be one reason in particular why it is desirable, in a publication like *The Metal Worker*, which reaches so many different classes of intelligent and interested readers, to dwell upon these principles. It is often asserted that different authorities on sanitation do not agree as to the fundamental requirements of sanitary house drainage, and that, this being the case, it is wiser to be distrustful. I contend most emphatically that this is not so, and my object in writing these pages will be sufficiently attained if I succeed in demonstrating the fallacy of this popular belief, and in convincing my readers that whatever differences of opinion may still exist refer rather to details of execution than to the principles which should guide us in the proper arrangement of plumbing and house drainage work.

It seems also desirable to state that, in the present article, I refer exclusively to the modern American plumbing and drainage practice. The English practice in laying out plumbing work, owing to differences in climatic conditions, differs from our own in many important particulars. Hence no greater mistake can be made than to apply the rules derived from English standard text books on plumbing and house drainage to works carried out in our own climate. Yet this is often done, particularly by people who, without practical experience and technical training, have acquired their limited knowledge of the subject merely by reading the English text books.

We may consider the drainage and plumbing system of a building as being composed of the following parts and subdivisions, viz:

1. The Pipe System—viz.:

(*a*) The sewer system, embracing the house drains, soil pipes, waste pipes and vent pipes.

(*b*) The storm water and subsoil water system, embracing rain water conductors, yard drains, area drains, cellar floor drains and subsoil drains.

(*c*) The disconnected pipe system, embracing safe wastes, tank or other overflow pipes, refrigerator waste pipes, boiler blow offs, tell tales, floor drains, discharge pipes from automatic cellar drainers, waste pipes from fountains in conservatories, &c.

(*d*) The supply system, hot and cold and circulation pipes, the cisterns, tanks, boilers, pumps, valves and faucets.

(*e*) The gas piping system.*

2. The Trap System.

3. The Fixture System.

In considering the principles which govern the scientific execution and arrangement of plumbing work, I shall endeavor to demonstrate their applicability to the above systems and subdivisions.

I —SOUNDNESS OF MATERIAL.

The first principle is the soundness of all materials used in the construction of the work. In other words, the pipes, the traps and the fixtures must be durable, strong, cleanly, non-absorbent and non-corrosive.

For outside house drains and sewers well glazed terra cotta socket pipes should be used. The pipes should be of the quality known as double strong, which comes in lengths of 3 feet, thus reducing the number of pipe joints and the incidental chances of leakage. One important feature concerning vitrified pipe is the shape and size of the socket, for upon it depends the strength and durability of the pipe joint. Until quite recently the pipe hubs were not manufactured of sufficient diameter and depth to enable the drain layer to insert a gasket of oakum and the proper quantity of Portland cement mortar, but now such improved pipe is being extensively manufactured and should be given the preference wherever first class work is expected.

All soil, waste, drain and vent pipes inside of a building should be of extra heavy cast or of heavy wrought iron. The cast iron pipe should be free from sand holes, cracks, flaws or other defects, the hubs of the pipes should be

* The gas piping is included in this article for two reasons. 1. Because the gas piping of a house is in nearly all cases executed as a part of the plumbing work. 2. Because it is quite important, from a health point of view, to have the gas pipe system sound and tight and scientifically arranged, although this matter is as yet hardly sufficiently appreciated by the general public.

very heavy and deep for calking purposes, and it is well to use only pipes and fittings which have been tested by hydrostatic pressure. With such "tested" pipe I can see no great risk in using tarred pipe, always provided the tarring is applied after the test has been carried out at the foundry, and for many reasons I prefer such tarred pipe, in particular for pipes laid underground, as well as for vent pipes and the extensions of soil and waste pipes.

The question of protecting pipes from rusting or corrosion is still more important in the case of wrought iron pipes used for house drainage purposes, and if the welded seams of wrought iron pipes are properly tested under pressure at the pipe mills I can see no good reason why they should not be protected by asphalting or by the rustless process. Plain wrought iron pipe, owing to its extreme liability to corrosion, is certainly not well adapted for underground sewage pipe conduits, nor is it at all advisable to use such plain wrought iron pipe for vent pipes in buildings.

The principle of soundness of material requires also that all the parts of a pipe system be of a uniform character, hence vent pipe extensions above the highest fixtures should always be of the same material as the flow pipes for sewage, and vertical soil and waste pipes should be as heavy as the pipes used for the horizontal portion of the main house sewer system.

Where lead is used for waste or vent pipes it should be heavy drawn lead pipe. Where the waste and vent pipes at fixtures are of brass, heavy brass pipe, and not the light tubing, should be used, and care should be taken to have the interior diameters of such pipes of the full bore required,

Particular attention should be paid to the brass ferrules required to join lead and cast iron pipes. Extra heavy brass thimbles should be used, and being cast must be carefully inspected for sand holes or flaws.

The lead used for calking cast iron pipe joints should be pure pig lead cast in bars, and no old lead piping liable to contain solder or impurities should be taken for this purpose.

Soundness of materials is also required in the supply pipe system. Heavy lead only should be used for supply pipes, or else wrought iron pipes, protected against corrosion by galvanizing, enameling, asphalting or by a rustless process. Annealed tinned brass pipes constitute an excellent material for the supply pipes of a house.

In connection with the supply pipes it is quite important to use only valves and shut offs of a superior quality of steam metal and of the best makes, and the same is true of the faucets for fixtures, whether self closing, ground key or compression bibbs are chosen. Economy in this respect is always dearly bought.

Where a superior job of gas piping is desired, galvanized wrought iron pipes should be used, and under all circumstances, even with plain wrought iron piping, it is advisable to use galvanized malleable fittings.

Traps for fixtures may be of lead, brass or iron, or else in many forms of water closets are molded in glazed earthenware and form part of the bowl. Drawn lead traps are superior to cast lead traps, and where the latter are used they should be tested for sand or pin holes. The same precaution is advisable in the case of cast brass traps. Where it is necessary to use iron traps under water closets or other fixtures, the inside of the traps should be white enameled to insure a smooth surface and to avoid corrosion.

The principle of sound material applies equally to the fixtures used in house drainage work. Porcelain or a good quality of white glazed earthenware and yellow stoneware are the materials most suitable for plumbing appliances from a sanitary point of view, although annealed glass, if obtainable, would be preferable for many purposes. The manufacture of enameled iron ware has now reached a high state of perfection, and fixtures of this material, being less heavy and less expensive, are extensively employed. Marble and slate, soapstone and artifical stoneware are suitable, as are also white metal, German silver, planished or nickel plated copper. Wooden fixtures are no longer used in good work, because wood, if alternately wet and dry, will soon rot, and because its pores absorb organic matters and become foul in a very short time.

II.—PERFECTION IN WORKMANSHIP.

The second principle requires perfection in workmanship, whether in the many forms of joints used in plumbing work or in the manner of fastening and supporting pipes, or in the proper run, alignment and grade given to the pipes for water, drainage and gas service. Without this perfection in workmanship the objects of a well-planned system of plumbing will not be attained in spite of the use of sound and good material. Hence the importance of making all pipe joints absolutely tight, whether the joint be a calked, screwed or soldered joint, and whether the pipe conduit be employed for the conveyance of water, gas or fouled organic wastes.

Leaky joints in water pipes may cause damage to decorated ceilings, wall hangings, floor coverings in a dwelling house and in warehouses, stores and office buildings may injure the goods stored therein, or destroy important documents. Leaky joints in the gas pipe system may destroy plant life, or injure book bindings and picture frames; they may also cause ill health and suffering and sometimes death by asphyxiation; at other times dangerous gas explosions and destructive fires may result. Leaky joints in the soil, drain, waste and vent pipe system, aside from the annoyance of foul odors, are the frequent cause, by the introduction of disease germs, of sickness and death in many a household.

The tightness of all pipe systems in a house is, therefore, a matter of the greatest moment, and should be ascertained not only before a building is completed, but also from time to time after it is occupied, by proper tests, to which I shall refer hereafter.

All joints on the sewer side of traps require particular attention. Thus in all forms of water closets or other fixtures where the trap is molded in one piece with the bowl and set above the floor, the floor joint should be very carefully made. Care should also be taken to set all fixture traps perfectly level.

All iron pipe lines should be properly supported to prevent settling or sagging of the pipes, and the supports should be very strong, preferably of wrought iron and firmly attached to the walls, floors or ceilings. House drains should be supported on brick or concrete piers at suitable distances. Heavy lead pipes are particularly liable to sag and should always be supported on continuous boards. All pipes of the water, gas, drainage and roof water system should be arranged as direct and straight as possible.

All branches in the drainage system should be Y-branches and all changes in direction must be made with curves of a large radius. Sharp curves and right angled connections are quite objectionable because tending to cause accumulation and ultimately stoppages.

The importance of employing only the best skilled labor for such work cannot be overestimated. As regards the best way of doing new plumbing work, whether by day's labor on a fixed percentage basis, or by contract work, for a stipulated sum, much may be said on both sides of the question. If an owner chooses for the work a contractor of good standing and unblemished reputation, who is personally known to him, and if this contractor has in his employ a reliable foreman and competent mechanics, a good job may be secured at a fair and not excessive price if carried out by day's work.

An equally good job may, however, be obtained in many cases if the work is given out by contract, provided the owner has beforehand settled all questions of fixtures and arrangement, and also provided the work is done in accordance with carefully drawn plans and specifications under the superintendence of some qualified disinterested expert of reputation, and provided, finally, a few judiciously selected and reliable firms of equal standing are invited to estimate on the work.

Where the contractor is not known to the owner or architect it is always better to have the work done by contract for a fixed sum agreed upon.

Where bids for work are publicly advertised it is generally unsafe to give the contract to the lowest bidder.

III.—SIMPLICITY IN ARRANGEMENT.

A third principle is simplicity in arrangement, and this requirement applies not only to the work as a whole, but also to its different parts, to the soil pipe system, the supply system, the trap system and the fixture system. This requirement is of the utmost importance and should ever be borne in mind from the conception of the work to its final execution.

It means that plumbing and drainage work must be carefully planned so as to secure as much compactness and directness as possible. It signifies that plumbing fixtures should be concentrated and located as much as possible directly in vertical groups, in order to avoid a useless multiplication of soil pipe stacks and the increased risk incident to a wide distribution of plumbing fixtures.

This principle, furthermore, requires that the number of fixtures or of outlets into the drainage system be reduced to the minimum of necessary fixtures, and that all long horizontal lateral branches be avoided, by placing the needed fixtures as close as possible to the main line of soil pipe.

The plumbing work of a house should not be scattered, but be confined to the toilet room, the bathrooms, the kitchen, butler's pantry, scullery and laundry. Plumbing fixtures should be abolished in living rooms, as well as in the cellar of the house. The sink which receives the disconnected pipe system is the only fixture which should be placed in the cellar.

I am not at all in sympathy with the modern tendency of making plumbing work elaborate, costly, and in every way complicated. The simpler a system can be laid out the better, in my judg-

ment, will it be. Thus it is objectionable to have several lines of vertical soil pipes where, by a slight change in the location of some fixture, a single line would answer the purpose. In like manner, one water closet in frequent use is preferable to two or three, each used only at rare intervals.

I should likewise avoid any complicated system of water service distribution necessitating running supply pipes horizontally across floors and over decorated ceilings. The proper place for the water distribution of a house is at the cellar, or, better, at the basement ceiling. The branch supply pipes in bathrooms should be kept in sight, and run above the floor along the walls. I should aim to make the whole supply system as simple as possible, and should avoid, in the hot water service, the usual complicated double boiler system.

In the trap system all double trapping on the main drain and at fixtures, particularly at water closets, and all manner of complicated trapping devices are objectionable. A good rule to bear in mind is that the trapped waste from a fixture should not pass through another trap before reaching the soil or waste pipe.

Where a simpler system can be arranged just as safely, I should not favor the back venting of traps, because it adds all manner of complication to the work, because it renders the work vastly more costly, and because it adds new dangers and thus makes the plumbing work less safe than expected. I shall refer to this point once more when speaking of trapping. The back air or double pipe system is sometimes made still more complicated by adding a third pipe system—namely, the local vent pipes carried from the house side of traps to some heated flue. While this method can undoubtedly be made to work quite efficiently, it seems hardly necessary where proper ventilation of the rooms containing exposed and accessible plumbing work is provided. Simpler methods of soil and vent systems than at present required in most plumbing regulations are much to be desired.

Lastly, the utmost simplicity should be observed in the fitting up of plumbing fixtures, and all kinds of complicated apparatus should be avoided as being more expensive in first cost, less efficient, and quite costly in maintenance and repairs.

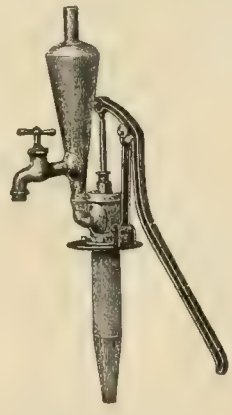
(*To be continued.*)

In a recent report to a local board of trade in England, there appeared the following item respecting cements for earthenware pipe: "There are many inventions for making the joints of stoneware pipes water tight, but as some of them are at present monopolies, I refrain from alluding to them. I will, therefore, merely mention the 'Stanford' form of joint, which any builder can easily make on the ground, or can obtain ready made from manufacturers. The composition used in Stanford's joint is composed of one part of boiled tar, one part of clean sharp sand and one part and a half of sulphur. The sulphur may be increased to one part and three quarters, if it is desired to make the joints harder for the purpose of carriage, &c."

John C. Savage has opened a plumbing shop at 70 West River street, Hyde Park, Mass. He served several years with Meade & Rossmann of New York, and afterward with John N. Tucker & Co. of Boston.

Flange Force Pump.

The accompanying illustration shows a flange force pump intended for securing to a shelf and which is manufactured by S. Wilder & Co., Holliston, Mass. These pumps are made of 32-ounce copper, and are recommended by the manufacturers for any purpose required of a house pump. The entire iron



Flange Force Pump.

work is malleable. In the illustration the pump is shown with the upper air chamber applied. These pumps are made in three sizes, with a diameter of 2½, 2¾ and 3 inches.

TRAPS AND VENTS.

The Associated Master Plumbers of Victoria, Australia, at their July meeting, adopted a proposition that the association should engage lecturers in order that members might qualify themselves for passing whatever examinations might be required for registration.

The rules and regulations governing the Utica, N. Y., plumbers have gone into effect, and Plumbing Inspector McKeough is busy sending out notices to plumbers who have passed their examinations that they must secure licenses at once.

From the Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, comes a 12-page pamphlet under the date of October, 1893, devoted to kitchen sinks and plumbers' goods. These goods, they say, are pressed from single steel sheets, presenting round corners, and are so strong that there is no danger of breakage in shipment. They are furnished plain, painted, galvanized or enameled, and provided with the most approved styles of couplings. The line embraces several styles of kitchen sinks, pantry sinks, washbowls, drip trays and laundry tubs. Seamless enameled wrought steel kitchen sinks is the line to which they invite special attention, and any plumber who has not received a pamphlet should send for one. Plumbers' ladles and the "L & G" retinned wrought steel gas pipe straps are other lines that are displayed.

The recommendation for the appointment of Sewer Engineers Manson and Grunsky to superintend the building of some new sewers in the outlying sections of San Francisco, Cal., is said to have met with some opposition from the politicians, who wish to use the patronage for their interests in the fall elections.

The Board of Examiners of Plumbers, at Boston, recently met at 12 Beacon street and organized, with Dr. S. H. Durgin as chairman and Capt. John S. Damrell and William S. Mitchell as other members of the board. All future applications for examination will be attended by this board.

At a recent meeting of the Board of Health of Detroit, Mich., Dr. McLeod submitted to the board a detailed proposition relative to the organization of the Bureau of Sanitation, to be created under the new health law. The bureau is to be composed of the Health Commissioner, Chief Inspector of Plumbing, two assistants, the Sanitary Expert and the Board of Examiners for the plumbers and a clerk. The bureau will have control of plumbing, drainage and ventilation of public buildings, and all plans of new buildings will be submitted to it.

In the absence of President Byron Parker, J. Frank Kertz presided at the last meeting of the Board of Supervisors of Plumbing and Plumbers, at Hudson, N. Y. The other members present were: H. A. Feroe, William H. Hudson and J. Ganley, inspector.

Plumbing Inspector Lapsley of Salt Lake City, Utah, in one week issued five plumbing permits, one sewer permit, inspected 17 jobs of plumbing, and condemned one.

The State Board of Health of Connecticut recently investigated the sanitary condition of the state prison, and they report that while the general sewerage and sanitary arrangement was good, there was no plan showing the location of the main sewer and no manholes by which the sewer may be flushed and obstacles removed. Some of the closets in the outbuildings were in bad condition. The recommendation was made that the work be put in first class order.

The delegation of plumbers who visited Wilmington, Del., to organize an association of master plumbers in that place was composed of president Finnerty of Boston and vice-president Mitchell of New York, of the National Association of Master Plumbers; H. G. Gabay of New York; Thomas Radcliffe of Brooklyn; John Trainor of Baltimore; John Eyanson, William Harkness and John E. Clark of Philadelphia, who stopped at the Hotel Willis.

President Daniel G. Finnerty of the National Association of Master Plumbers was busily occupied last week. On Thursday afternoon he organized an association of master plumbers in New Bedford, Mass., on Friday morning an association at Brockton, and in the afternoon still another at Taunton. He was accompanied by David Smith, recording and financial secretary of the National Association.

The Monitor Iron Works, at 76 and 78 Centre street, New York, have been running both of their foundries full time to fill their orders for plumbers' cast iron goods.

President Finnerty and Secretary Smith of the National Association of Master Plumbers recently visited Fall River, and preliminary steps were taken for the organization of an association of master plumbers. P. C. Fogwell was elected president and Michael Donovan secretary of the temporary organization. A committee was appointed to wait upon the plumbers of the city in order to have a full representation in the association. When the roll of membership is complete a permanent organization will be effected.

THE PROTECTION COMMITTEE of the Master Plumbers' Association of New York are submitting to the manufacturers and dealers in plumbers' goods a paper that is said to be even more stringent than the "Baltimore resolutions" in its protection to the interests of all concerned. The paper has been well received generally and a number of signatures have been obtained, though the entire trade have not as yet indicated their position.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

R. D. MASON was the successful bidder for putting a steam heating apparatus in the Gill Building at Alton, Ill. The price reported is $549. He has just completed the installation of a steam heating plant in the new residence of Mrs. Laird.

IN SECURING THE CONTRACT for ventilating and heating and installing a system of crematory dry air chests in a new school building in Cincinnati, Ohio, the Bennett & Peck Heating & Ventilating Company of that city have been awarded the fourth contract for work in the city's public buildings recently.

LUCAS & RUHAAK of Pekin, Ill., are putting a steam heating apparatus in Ehlicher's drug store.

C. H. KNELLY of Cunningham, Pa., has secured the contract for setting a large steam heating boiler in the new isolating ward at the Pennsylvania State Hospital.

THE SCHOOL BOARD of Lynchburg, Va., have contracted with the Bennett & Peck Heating and Ventilating Company of Cincinnati to put their system of heating, ventilation and dry closets in a new school building.

THE RICHMOND STOVE COMPANY, Norwich, Conn., report that the contract for heating in the St. Hyacinth R. C. Church at New Bedford, Mass., has been awarded to Abraham Knowles, who will use two Richmond sectionals; that W. A. Putnam, Warren, Mass., has just completed a heating plant in the Brookfield, Mass., Public School Building, using a Richmond sectional. George T. Barnes will use a Richmond sectional to heat St Luke's Hospital, at Newburgh, N. Y., and will also use one of the new 320 series of Richmond sectionals for heating the court house at Newburgh. E. H. Randell of Concord, H. H., is placing one of the Richmond sectionals in the cutlery works at Antrim, N. H. A No. 66 Victor will be used by W. R. Park & Son for heating the Winthrop Club Building at Taunton, Mass.

UP TO NOON of October 26 bids will be received for the plumbing, gas fitting, steam heating, galvanized iron and tin work, in the new Southern California State Asylum for the Insane and Inebriates, at San Bernardino, Cal.

MILLER & JONES of Fall River, Mass., have been awarded the contract for a heating apparatus in the Robinson School House at that place, at a reported cost of $3300.

THE CONTRACT for a steam heating plant at the Thomas House at Streator, Ill., was awarded to the Milford Heating Company.

THE COUNTY COMMISSIONERS of Ironton, Ohio, at a recent meeting instructed the auditor to ask for bids for replumbing the Infirmary.

WILLEY & CALHOUN of Portland, Maine, have been awarded the contract for placing the heating apparatus in the Public Library at Westbrook. They are also setting heating plants in the residence of Hon. L. D. Sweat and at the old homestead, at Saco River, of Miss Usher.

THE ROBINSON HEATING & VENTILATING COMPANY of Altoona, Pa., are installing a Florida steam heater in the new Quandt & Cherry Building, and a 25 horse-power portable boiler for the Altoona Hospital.

AFTER EXAMINING several systems of heating and ventilating school buildings, the Syracuse, N. Y., Board of School Commissioners have decided to award a contract to the Fuller & Warren Company of Troy, N. Y., for putting in the heating and ventilating apparatus of a new school house in Syracuse for $3000, which price includes their cremating closets.

SOME NEW HEATING CONTRACTS that have been secured by Rufe Brothers of Doylestown, Pa., are for the Fountain House and Hillyer's store, in that city, and the Fort Side Hotel, at Fort Washington, Pa.

W. M. MACKAY, 236 Water street, New York, manager of Hart & Crouse's steam and hot water business, reports the following recent sales of Royal heaters for use in public buildings: Queens County Bank, Long Island City, L. I.; St. Luke's Episcopal Church, Matteawan, N. Y.; Jonestown Church Home, Jonestown, Pa.; Reformed Dutch Church, Montgomery, N. Y.; Electric Car Barn, New Haven, Conn., Royal steam heaters, and Public School, Atlantic Highlands, N. J., and Public School, Milwaukee, Ore., Royal hot water heaters. In addition to a number of private cases they are furnishing steam heaters for ten greenhouses at Woodside, L. I., and eight Royal steam heaters for the Columbian Building Association, Paterson, N. J. All these cases are placed by local steam fitters in the different sections; Hart & Crouse stating that they do not contract for setting up any work themselves.

B. H. HILLIAR, New London, Conn., have the contract for new heating apparatus at Fort Trumbull, at the same place. Formerly stoves were used, but now four hot water heaters will take their place.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until October 31 for the low pressure steam heating and ventilating apparatus and reconstructing part of the old apparatus and furnishing a new power boiler for the United States Court House, Post Office, &c., building, Dallas, Texas. Drawings and specifications may be obtained from the Supervising Architect, at Washington, and at the office of the superintendent, in Dallas, Texas.

THE ILLINOIS HEATING COMPANY, 88 Lake street, Chicago, have contracts for hot water heating in the following buildings in Chicago and vincinity. The residence of J. H. Snitzler, Drexel Boulevard and Forty-fourth street; residence of E. V. Roddin, 57 Cedar street; residence of Geo. Rost, Lake View; residence of Dr. Beery, Michigan Boulevard and Forty-sixth street; residence of Max Tonk, 592 Fullerton avenue; apartment building of John A. Roche, Chicago; residence of Thos. Costello, Naperville, Ill.; residence of Truman Huling, Kankakee, Ill. The above company have also the contracts for steam heating in the following buildings: Apartment building of J. T. Mathews, Washington Boulevard; apartment building of F. J. Lange, Dening Court; residence of Mrs. Mayer, Grand Boulevard and Forty-second street; residence of F. W. Hamil, Hyde Park; offices of Fred. Miller Brewing Company, Western avenue; apartment building of Miss Helen Culver; apartment building of O. Brewer, Woodlawn. American radiators are to be used for the above.

THE L. H. PRENTICE COMPANY, 203 and 205 Van Buren street, Chicago, are putting in the steam heating plant for the New York Biscuit Company, Randolph, Carpenter and Morgan streets, Chicago.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, have on hand one of the largest steam heating contracts lately taken in the United States, for heating the Bourse, Philadelphia.

A good story is told on Newburg, N. Y., by P. M. Moffat, now engaged in plumbing and hot water heating, at 436–438 Kent avenue, Brooklyn, and until lately an instructor at the Pratt Institute. It seems the water authorities of that town, from which originally our informant came, were puzzled at the insufficient delivery from one of their mains. They experimented more or less, and, as a last resort, sent to this city for a hydraulic engineer, now prominent in the Brooklyn system. The engineer journeyed to hilly Newburg and agreed to set matters right for $1200. He looked the ground over carefully, elevations particularly, and finally indicated a spot where a gang of laborers should be put at work sinking a shaft to the main. When they reached the big main it was tapped and the air bound pipe relieved of its large bubble of air that had accumulated at a certain high part of the main, reducing its capacity nearly one half. It could neither get one way nor the other, and until it was released there was no chance for more water. This happened 25 years ago; but the laws of hydraulics are the same now as they were then, though probably it would not cost $1200 to-day to locate an air trap.

Manual training is about to be introduced into the public schools of Brooklyn, a sum of $10,000 having been appropriated to this object by the Board of Education. This will defray the expenses of the first experiment in this direction, which will be in the shape of a manual school to be established in the Boys' High School, where the rudimentary principles of several trades will be taught to lads recommended by the principals of the schools.

Orders have been sent by the Navy Department to Rear-Admiral Belknap, at New London, Conn., directing him to send out the dynamite cruiser "Vesuvius" on the unique and hazardous duty of blowing up 14 derelict vessels that endanger navigation. All the derelict vessels to which the "Vesuvius" is assigned were wrecked during the recent hurricane on the Atlantic Coast, and nearly all are adjacent to the Jersey shore.

TIN PLATES.

Tin Plate Imports.

The Treasury statement of imports and exports of the United States, lately issued for the month of August, 1893, contains some interesting statistics in regard to the importations of tin plates during the past five years, as compared with those of the first eight months of 1893. The following tables exhibit the course of the trade during the periods referred to, and indicate a decided falling off in the value of imports of tin plates during the current year:

Imports of Tin Plates, Terne Plates and Taggers' Tin, in Pounds.

Quantities.				Values.			
Month ending August 31.		Eight months ending August 31.		Month ending August 31.		Eight months ending August 31.	
1893.	1892.	1893.	1892.	1893.	1892.	1893.	1892.
42,546,544	49,101,440	446,466,013	433,688,942	$1,142,842	$1,392,193	$12,307,056	$12,343,512

Comparative Summary of the Values in Dollars of Tin Plates, Terne Plates and Taggers' Tin Imported During the Eight Months Ending August 31, from 1888 to 1893, Inclusive.

Eight months ending August 31.					Average of the preceding five periods.	Eight months ending August 31.	1893 compared with—	
							Average of preceding five periods.	Period of 1892.
1888.	1889.	1890.	1891.	1892.		1893.	Increase + Decrease −	Increase + Decrease −
13,621,265	15,242,407	14,862,008	23,529,483	12,343,512	15,919,735	12,307,056	— 3,612,679	— 36,456

The decrease in the value of tin plate imports, shown above, for the first eight months of 1893, while the actual weight of plates imported increased by 12,777,071 pounds, indicates how remarkably prices of foreign tin plates have been lowered since last year. They are now, indeed, not only lower than they have ever been before, but they are actually almost down to the level of their prime cost, so that Welsh makers are naturally heard to complain of vanishing profits, and to declare, as many do declare, that it is more economical to close down their works altogether than to run them at the present unremunerative prices. The influence of domestic made tin and terne plates on the market appears to be conclusively shown in the very narrow increase of imports recorded. This is, doubtless, largely attributable to the recent financial depression, combined with an anticipation of approaching tariff changes, which have induced conservatism on the part of importers, and have made them naturally disinclined to carry any unnecessary stocks of foreign material under the present condition of the market. But when it is taken into consideration that last year's tin plate importations were exceptionally light, by reason of the large stocks that were laid in immediately prior to the imposition of the tariff in July, 1891, the narrow increase of this year's imports so far over those of 1892 tends to show that the supply must have been supplemented from some other source. There is no evidence that the consumption of tin plates has fallen off; conclusions, in fact, point in the opposite direction—namely, that the 100,000,000 pounds made in this country during the year ended June 30, 1893, was the source whence was drawn the balance of the tin and terne plates consumed in the United States during the first eight months of this year.

The Success of the American Tin Plate Industry.

The last report of Ira Ayer, Special Agent of the Treasury Department, says *The Iron Age*, shows that even at this early date the American manufacturers of tin plate have reached a state of development which brings them very near the attainment of the quantity called for by the tariff act. Even under the strictest interpretation of the law its requirements would now be met, if the financial panic had not interfered. Under the recent Treasury ruling only those tin and terne plates are counted as being American which have been made from black plates rolled in this country. The tariff act provides that the present duty shall stand if it can be shown to the satisfaction of the President of the United States that the American product of plates weighing less than 63 pounds per 100 square feet is equal to one-third of the importations in any one of the fiscal years up to June 30, 1897.

Thus far the year of lightest importations has been the fiscal year ending June 30, 1892. One-third of the net imports thus figure out 79,307,939 pounds. During the quarter ending June 30, 1893, the production of tin and terne plates from American black plates was 18,264,225 pounds, of which about 94 per cent. were plates weighing less than 63 pounds per square inch, or say 17,167,000 pounds. To this must be added, according to law, 2,322,455 pounds of tinned or terned articles made from American sheet iron or steel. This carries the total for the quarter, under the narrow lines fixed by the present Treasury officials, to about 19,489,455 pounds. If this rate is kept up for four successive quarters, covering a fiscal year, the American producers will have complied with the provisions of the act, because the product would be close to 79,000,000 pounds, which is the mark to be passed.

We know that full capacity had not been attained in the quarter ending June 30, 1893, although it did show an advance from 14,102,299 pounds to 20,586,680 pounds, comparing it with the preceding quarter. It is quite sure that if general business is in a normal condition the manufacturers of tin plate in this country can make from American black plates a sufficient quantity to meet the requirements of the law. The only point concerning which any doubt might possibly arise is whether our sheet mills are now in a position to readily supply the needed annual quantity of 75,000,000 pounds of plates lighter than 63 pounds per 100 square feet.

We took occasion recently to criticise the tables relating to capacity issued by the Treasury Department and printed in *The Iron Age* of September 14. The table then printed assigned to makers of tin plate from American black plates an annual capacity of about 30,250,000 pounds, based on three and one-half times the product of the quarter ending March 31. At the time of the publication of that article there were in the possession of the Department the sworn returns of the manufacturers for the last quarter of the fiscal year. These show an actual make of over 18,000,000 pounds, or at the same rate of figuring, by multiplying by three and one-half, an annual capacity of about 64,000,000 pounds, or double the estimate of the Treasury officials. We believe that no more evidence than this is required to show what means are resorted to by hostile officials to create impression adverse to a rapidly developing industry. We need hardly add that we do not hold Ira Ayer responsible for work so little worthy of Government officials.

Banka and Billiton Tin Statistics.

The Bureau of Statistics has published tables showing the quantities of tin produced in the Dutch East Indies. From the middle of April, 1891, to the middle of March, 1892, and during the years 1886 to 1891, the production of Banka was as follows:

Tin Production of Banka.

Districts.	Gross tons.

Blinjoe	1,021

Soengeiliat	1,030
Merawang	696
Pairg Kalpinang	892
Soengeisleian	670
Koba	208
Toboali	278
Total 1891-92	5,755
1890-91	6,490
1889-90	5,431
1888-89	3,993
1887-88	5,110
1886-87	4,668
1885-86	4,631

The figures for Billiton are as follows :

Districts.	Gross tons.
Tandjong Pandan	355
Manggar	2,518
Linggang	1,905
Boeding	1,264
Dindang	342
Total year ending April 30, 1892	6,384
1891	5,842
1890	5,825
1889	4,795
1888	4,713
1887	5,400
1886	4,908
1885	3,759
1884	4,297

In the last year reported the number of hands employed in Banka was 7989, while the number was 8690 in the Billiton mines.

SCRAP.

A PATENT has just been granted to Geo. W. Jaques of the tin plate firm of A. A. Thomson & Co., New York, for an improved apparatus for coating sheet metal. The object of the invention is, in part, to attain two temperatures at the bath with one fire, and in part to provide simple means for regulating the temperature of that portion of the bath where the molten metal is covered with oil, and further to provide a construction of the bath which will enable the minimum amount of molten metal to be used. A chief feature of the apparatus lies in the arrangement of air flues for cooling the metal under the oil.

IMPORTS OF TIN PLATES by sea into San Francisco, Cal., during the half-year ended June 30, 1893, amounted to 21,400,730 pounds, or 159,361 boxes, valued at $611,198.

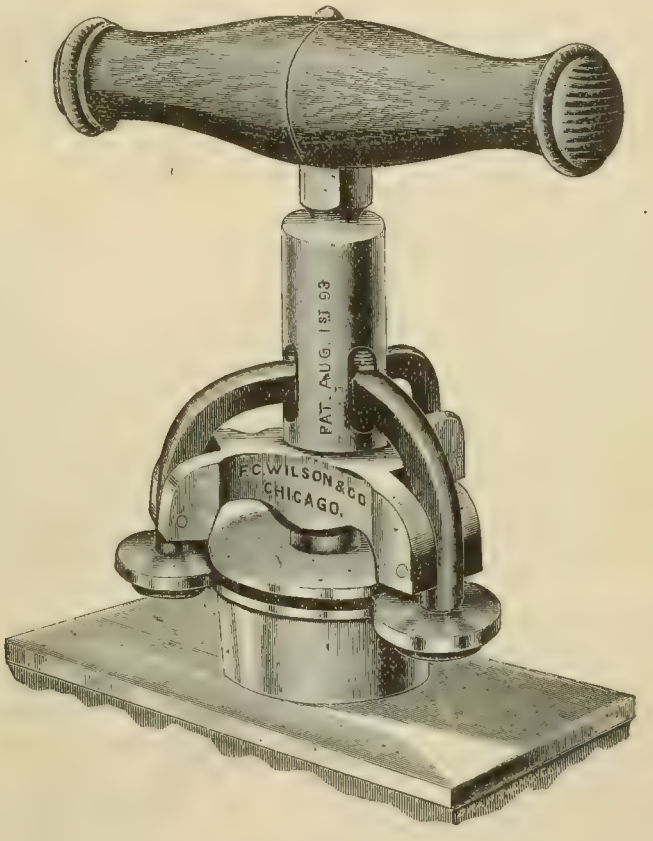
E. MOREWOOD & Co.'s large tin-plate plant at Gas City, Ind., is reported to be rapidly getting into shape for work in all departments. A portion of the tinning department has been under way for some time, and new pots are being started into work as they are installed, so that a large output of tin plates will be made within a short time. The cold rolls were recently put in operation, and other departments of the mills are approaching completion. The work of the establishment will, it is understood, be carried on under the personal direction of J. H. Rogers of the Morewood firm, who has recently arrived from Wales and proceeded to Gas City. Mr. Rogers' practical and theoretical knowledge of the art of tin plate manufacture is probably unrivaled.

THE WORKS of the Morlais Tin Plate Company, at Morlais, Carmarthenshire, and of Thomas, Lester & Co., at Carmarthen, are the latest additions to the list of Welsh tin plate works which have been closed down owing to the depressed condition of the market.

Connection was made last week on the longest telephone line in the world except that between New York and Chicago. It stretches from Spokane, Wash., to Portland, Ore., by way of Puget Sound, a distance of nearly 600 miles.

Nozzle Cap Crimper.

The illustration shown herewith represents a newly invented tool for crimping the caps upon the nozzles of varnish and other cans, being introduced by F. C. Wilson & Co., can and tank manufacturers, 239 and 241 Lake street, Chicago. It is claimed for this tool that it combines the lever and the wedge principle is so perfect a manner that little power is necessary in applying the caps, while the force exerted is so great that the nozzle and cap are joined so tightly that even the lightest liquids are perfectly retained. It will be seen from



Nozzle Cap Crimper.

an inspection of the engraving that three crimping rolls are mounted upon a corresponding number of levers. The central spindle of the disk which fits down upon the nozzle cap projects upward into the stock, and the ends of the levers which pass through the stock rest upon this spindle. When the tool is pressed downward the spindle presses against the ends of the levers, carrying the crimping rolls inwardly against the work, and by revolving the handle the edge of the cap is turned over. As the upper end of the spindle is oval and the ends of the levers are beveled, the wedge principle is brought into play, carrying the rolls against the work with great force. The handle is of wood, the stock of brass, the levers of machine steel, and the rolls of the best grade of tool steel. The whole is very simple in construction, and the claim is made that it is not liable to get out of order. The tool is the invention of F. Cortez Wilson of F. C. Wilson & Co.

The Bethlehem Iron Company shipped last week 64 tons of plate for the battle ship "Maine" to the national proving grounds at Washington. The plates are 8 x 15 feet, and 12 inches thick. These plates are the first service plates that have been Harveyized, and their trial will consequently be of interest.

Professor Bell on Aerial Navigation.

In the course of an interview recorded recently in Montreal with Prof. Alexander Graham Bell, that scientist and inventor declared his belief, amounting almost to conviction, that the flying machine would be an accomplished fact before the close of the century, or, at most, before the end of ten years. This great undertaking, he said, was no longer in the hands of "fakirs;" it was engaging the minds of practical scientists like Maxim, the inventor of the Maxim gun, and Professor Langley of the Smithsonian Institution. The great difficulty in the past was that inventors were on the wrong track. They had been vainly trying to make a flying machine on the principle of the balloon, lighter than the air. Such a machine could never be properly steered. The flying machine of the future would have greater specific gravity than the air. Of this Professors Langley and Maxim were convinced, and on this principle one or both will soon succeed. The machine need not have wings. Nature was not always a wise guide; the steam locomotive got on well without legs. Indeed, the rotary motion was the most economical.

Owing to the prolonged stoppage of operations at the rolling mills and blast furnaces in the Youngstown, Ohio, district, distress among the workmen is now reported, and public subscriptions are being raised for a relief fund. Generous amounts are being contributed.

ROOFING AND CORNICE.

The First Use of Sheet Iron for Cornices.

The first use of sheet iron for the fabrication of cornices and ornaments for buildings grew, says the *Ohio Valley Manufacturer*, out of an accident which occurred in Cincinnati in 1834. The accident that led to it was the fall of a heavy cornice stone that was being hoisted to its place on a high building. The stone in its descent crushed two men to death. The accident was witnessed by a sheet iron worker, who immediately began experimenting with galvanized iron and endeavored to shape it into a cornice. Being successful in this, a new field was opened for sheet iron.

The first cornice from this material was placed on the old National Theater in Cincinnati. New machinery was required for shaping cornices from sheet iron and Cincinnati also produced the firm that could design and make it. The predecessors of the firm now known as J. M. Robinson & Co. were appealed to, and they set to work at designing, and finally produced the first machine, which they called a cornice brake, and the first galvanized iron cornice was made on it. The later use of sheet and galvanized iron as panels, moldings, &c., for interior ornamentation was a natural evolution from the cornice and its allied branches of manufacture.

Deterioration of Zinc Work in Australia.

R. Gordon Hyndman, in a paper read a short time ago before the Royal Victorian Institute of Architects, in Melbourne, made the following observations in regard to the use of zinc for roofing and other architectural purposes in Australia: During the last few years in Melbourne the use of zinc has largely increased, both for ornamental purposes and, more commonly, for flashing. There are likely soon to be complaints as to the failure of this very useful but somewhat uncertain metal. It has been discovered on the Continent that where zinc work comes in contact with brick work the zinc pits and rapidly oxidizes and becomes brittle. Chemical tests show that the brick work itself contained 1.14 per cent. of soluble salts quite capable of producing these results, and that their action was stimulated by moisture. In other places zinc used for roofing and ornamental purposes has been found to deteriorate rapidly, especially in large cities, where coal is burned containing a percentage of sulphur.

Galvanized Iron Cornices.

We present in the accompanying illustrations views of examples of galvanized iron cornices made by W. H. Mullins of Salem, Ohio. The illustrations are taken from a recent small edition of Mr. Mullins' catalogue of cornices, building fronts and architectural sheet metal work. The cornice shown in Fig. 1 is 36 inches high, with a projection of 24 inches and a balustrade of 22 inches. Fig. 2 is 36 inches high, with a projection of 16 inches and balustrade of 28 inches. Fig. 3 has a hight of 45 inches and a projection of 23 inches, while Fig. 4 has the same hight and projection of 18 inches. These cornices are furnished complete and in as large sections as is convenient for transportation, with moldings, brackets and ornaments attached, so that only vertical joints are necessary. Furthermore, the different parts are marked and numbered so that

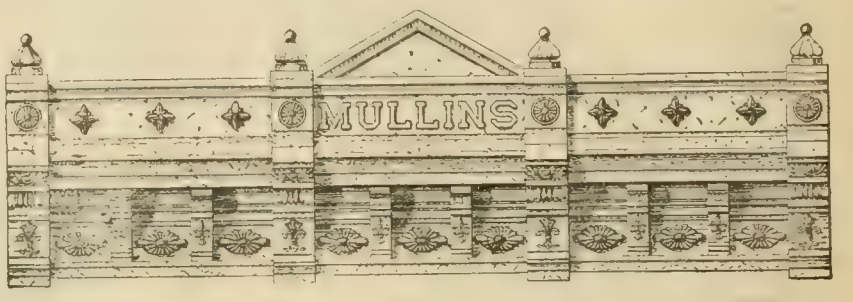


Fig. 1

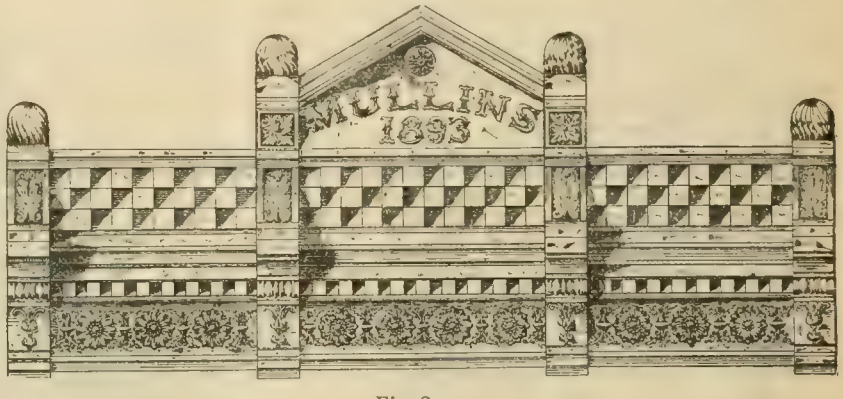

Fig. 2.

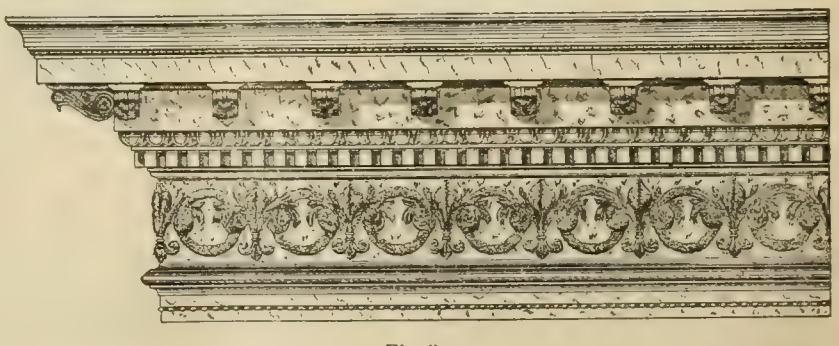

Fig. 3.

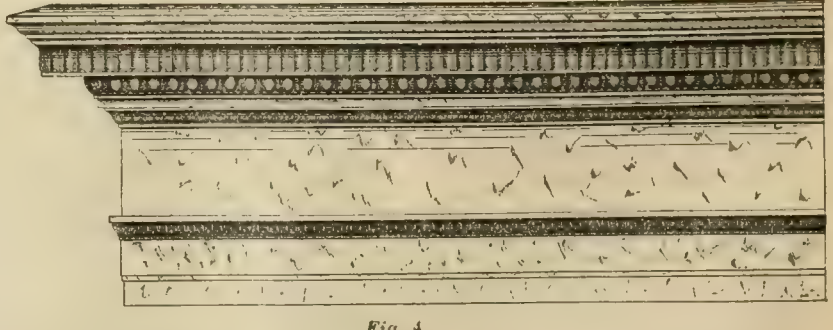

Fig. 4.

GALVANIZED IRON CORNICES.

by the aid of construction drawings and printed instructions, which are furnished with the work, they can readily be put on the building. The cornices are of galvanized iron, but can be made in copper if so desired.

Roofing Slate in California.

The fact that there is a growing demand on the Pacific Coast for slate roofing cannot be questioned, says the *California Architect and Building News* in a recent issue. In view of this it is but fair that we present at this time a few facts concerning a material which in the Eastern States, as well as Europe, is used almost exclusively for covering roofs. Our earliest building on this coast was of such a temporary character that no thought was given to how long the roof covering would last. The cheapest (first cost) most convenient material at hand would be selected and on it went. In a year or two if the roof leaked on went another, or the old one was patched up to try and outlive another winter. In a few years the roof had cost twice as much as would have covered it in the first instance with a material that nature has given us and which will not wear out for many years. Yet to bring slate from the East meant a very expensive roof, and only a few could afford to use the material. Not so to-day, for the opening of the slate quarries of El Dorado County, in this State, has put the material within the reach of every one. Again we have entered a new era in the building line. Our architects are being called upon to design structures composed of steel, iron, brick, terra cotta and stone, and such as will compare with any buildings in the world. This is what is causing a demand for slate. Our architects, if allowed, will have a material on the roof that will be in keeping with the rest of the building. The earliest use of slate for covering roofs (of which we have any record) was in the twelfth century. The old castles of North Wales at Carnarvon and Conway were covered with slate. Also the castle at Augers, France, built in the vicinity of the slate beds that are now being largely quarried underground. When Edward I visited the copper mines of Drwysyeold, in North Wales, he stayed at a house in Nantlle roofed with slate. On the mountain slopes of North Wales on several of the slate ranges are traces of old workers, and the tracks along which they carried the slate on their own backs, or the backs of their horses, are still discernible and form part of many a mountain path. In an ode written by a Welsh poet in the year 1570 we find the first mention of the Penrhyn quarries. The bard Sion Tudor asked the Dean of Bangor for a load of slate from the Caehier quarry. The Aberllefeni quarry is as ancient, for an old timbered house is said to have been covered with slates from the quarry in the days of Queen Elizabeth. About the same time the slates from the De la Bole quarries, in Cornwall, had attained considerable repute. Carew writing in 1602, describes them as "in substance thinee, in color faire, in waight light, in lasting strong, and generally carrieth so good regard as (besides the supply for home) great store is yearly conveyed by shipping both to other parts of this realm, and also beyond the sea into Britaine and "Netherlands." Speaking of the same quarry in 1758, Borlaise writes that for its lightness and enduring of weather it is generally preferred to any slates in Great Britain. He describes the great quarry as in his time 300 yards long, 100 yards wide, 80 yards deep. It is evident from the size of the quarry that a considerable quantity of slates had at that date been extracted from it.

The growth of the slate trade in Europe within the last 25 years has been something enormous, and may be spoken of as one of great prosperity, limited only by the ability to supply the demand. Merchants there are ready to contract for the whole output of good quarries. Aside from this, during the year 1892 New York alone exported to the British Isles 2,122,065 roofing slates; notwithstanding the great number of quarries in operation in Wales and the thousands of men employed in the production. . . . Until a few years ago all the slate used on the Pacific Coast come from the East, but to-day the County of El Dorado supplies most of the slate used in California. The quarries of this county seem to be the only deposit in the State that could be used for roofing, as the material for this purpose must have good cleveage qualities, or rather be such as will allow of its being split into sheets. California produces a slate of such quality and color as will compare with any produced in the world, and it can be bought for one half the cost of Eastern slate landed here. The fancy colored slate is fast going out of use, the demand being for black slates, and rightly so, for nothing can be more handsome than a plain black roof, particularly for our modern style of architecture.

A roof strong enough for shingles will hold slate. It is fire proof, and when laid properly the elements have no apparent effect. It will not absorb water nor hold snow. There are many instances where slate has been taken from a building on which it has been for 75 to 100 years and relaid on another.

Assuming the life of the various kinds of roofing to be as described in the following table, it will be seen that while the first cost of slate is somewhat greater than other materials, it has a very great advantage at the outcome:

Material.	Original cost per square or 10 x 10 feet.	Life.	Avergage cost per annum.
Slate	$10.50 to $11.00	100 years.	10 5-100 or 10 10-100 cents.
Tin	8 50 to 9.00	15 years.	66⅔ or more cents.
Corrugated Iron	8.00 to 8.50	10 years.	80 or more cents.
Shingles	4.00 to 5.00	12 years.	33⅓ or more cents.
Boards	2.00 to 2.50	8 years.	25 or more cents.

In above estimates we have made no allowance for painting the tin, iron or shingles. If these materials are not painted regularly and well, they will not last the time given.

To the owner or landlord no portion of a building is so great an expense to keep in repair as the roof, nor so great an annoyance to a tenant as a leaky one. Slate is always sold by the square, which is 10 x 10 feet, or 100 superficial feet. Let us have more slate roofs on this coast and the result will be that we shall have fewer fires, cooler houses in summer, warmer in winter, and last but not least, less expense for repairs.

FLASHINGS.

The Acme Roofing Company, Canton, Ohio, issue a handsome illustrated catalogue and price-list of their manufactures. The volume contains 90 pages, and is bound in heavy scarlet paper with the firm name and address in raised gilt lettering. The style of publication is excellent, the engravings being clear and the printing good. The first articles noticed are eave troughs and gutters, together with hangers, &c. Next come conductor pipes and heads, followed by elbows, cut offs, ventilators, &c. Several pages are given up to ridgings, cresting blocks and finials. Cornices of various styles are also shown, and a number of pages devoted to ornamental finials. The roofing section, which follows, relates to Acme standing seam roll cap roofing, corrugated roofing, crimped siding, corrugated iron, beaded iron, &c. Also metal ceilings and pressed brick. This is followed by illustrations of fire proof doors and shutters. Instructions are given for ordering roofing, siding, &c., and at the end various miscellaneous supplies for roofers are noted.

Zigzag corrugated iron is a suggestion made in the London *Ironmonger* as a material for house construction. The section recommended is a zigzag in which each rib forms a dovetail, so as to serve as a key to plastering, which would thus make the house cool.

One of the cheapest, simplest and most efficient devices for the protection of shingle roofs from fire is mentioned by *Fire and Water* as being introduced in some cities. It consists of nothing more than a water pipe running along the ridge board of the roof and connected with the water service of the building. The roof pipe is perforated at short intervals, so that at a moment's notice the roof can be flooded and rendered impervious to sparks and blazing fragments blown from burning buildings in the neighborhood. The device is at once so simple and effective that one wonders why its introduction was not coeval with that of water mains and hydrants.

Bruce & Cook of 188 Water street are the New York agents for the Hastings quadruple roofing folder described in *The Metal Worker* a short time since. The machine turns the edges on all four sides of a sheet of tin and leaves it square when used for sheet-at-a-time flat seam roofing and by a simple change turns two edges for forming rolls of tin for standing seam work. It has made a favorable impression on the trade and those sold have proven highly satisfactory.

The first consignment of corn ever sent from Mexico to Europe will be shipped next week from land adjoining the Monterey & Mexican Gulf Railroad, Mexico.

A piece of expeditious work is reported from New Jersey in the inauguration of the Newark and South Orange Railroad. After a bitterly contested litigation the company were, last Friday, granted a franchise for the erection of their trolley system by the South Orange Board of Trustees. Fearing an injunction might be obtained, they put 300 men to work on Friday night; poles were erected, wires strung, and electricity turned on at 10.40 a.m. on Saturday, the first car being run over the line in a little over 12 hours from the time the franchise was obtained.

Copper Coating the Hulls of Vessels By Means of Electricity.

Those familiar with the subject, and therefore well qualified to express judgment, have frequently and emphatically called attention to the necessity for sheathing the hulls of steel vessels with copper in order to obviate the troubles arising from marine growth, both animal and vegetable, on vessels not heathed with copper. It has been repeatedly pointed out that the cost of docking the vessels in the new navy will amount to many hundreds of thousands of dollars per annum, the cause for the docking being directly due to the fouling of the bottom. All the vessels should be docked twice a year and in some cases three and four times a year, depending upon the waters upon which they are afloat. Therefore any method which will obviate this difficulty should be received with favor. It is estimated by the officials of the Navy Department that the cost of docking, cleaning and painting the cruiser "Chicago" at suitable intervals during a three years' cruise will require the expenditure of nearly $100,000.

Theodore D. Wilson, late chief constructor of the United States Navy, in his report to the Secretary of the Navy writes as follows: "Thousands of dollars have been expended in the testing of protective and anti-fouling paints and compounds with results which give but very little encouragement to further experiments. We are forced to admit that despite the investigation of noted chemists and the deep study of other professional men there has not yet been discovered an efficient sustitute for copper sheathing."

The method of sheathing steel vessels with wood and afterward applying copper to the wood is extremely clumsy. In order to prevent galvanic action taking place, to the injury of the steel, it is essential to first attach a 2-inch wood sheathing to the steel by means of iron bolts, and on this place a second 2-inch sheathing attached by means of copper bolts, and this finally covered with copper sheets.

It is well known that marine growths take place no matter what the hull of the vessel may be covered with. The advantage of using copper lies in the fact that the growth, instead of being so firmly attached as to require mechanical means for its removal, as in the case of painted and plain hulls, is so weakly adherent that a slight motion of the vessel through the water, or even the ebb and flow of the tide, serves to remove it. Therefore, while a copper coated vessel may under certain conditions of inaction become slightly coated, as soon as the vessel moves through the water this growth falls away. The present Chief of the Bureau of Construction and Repairs in the United States Navy explains this in the following language, referring to copper: "That metal being easily corrodible in sea water, and the resulting verdigris having scarcely any adhesion to its metallic base, falls off with the least possible force, like the wash of the waves or the movement of the vessel through the water, and in falling off carries with it the marine accretions, leaving the metal continuously bright and clean. So continuous is the corrosion of the copper and the falling off of the verdigris that the spores of the marine fauna and flora have no time to develop, and the copper continues clean indefinitely. Experience has shown, however, that the loss of copper from this cause is only 30 per cent. of its thickness in 15 years.

Another vital condition, dependent on the keeping of the hull clean by sending the vessel to dock, is the decrease in speed and consequent increase in coal consumption due directly to the greater power required to drive a hull covered with marine growth through the water. Chief Constructor Philip Hichborn, U. S. Navy, in his report of April, 1889, estimates the resistance of an iron skin as twice that of a smooth copper bottom, increasing to nearly threefold when moderately foul, and to nearly nine times when barnacled, and barnacles and seaweed may collect upon the iron bottom to such an extent as to reduce the speed of the vessel to an almost imperceptible motion.

It is well known that United States vessels in waters far from docking facilities lose sometimes as much as 50 per cent. of their speed efficiency because their hulls cannot be properly cleaned.

Chief Constructor Wilson of the Navy Department, in his argument for copper sheathing, submitted a letter from Commander Philip of the "Ranger," dated June 22, 1892, in which he called attention to the fact that with a clean bottom the ship readily made 7 to 8 knots on 7 tons of coal, while with a foul bottom she only made 6 knots though burning from 12 to 14 tons of coal per day.

We illustrate in a general way a method of copper coating the hulls of steel vessels by means of electricity after patents issued to Thomas S. Crane, and which are controlled by the Ship Copper Plating Company of Newark, N. J. By this method copper is deposited electrically upon the surface of the vessel in successive sections, the joints of the sections being overlapped to unite them. The joints are united so perfectly by the electroplating process that the whole coating of the vessel becomes an unbroken metallic sheet. The plating is done by means of a bath like a rectangular box open at one side and fitted water tight to the skin of the ship.

Fig. 1 shows in side elevation the application of the tanks to be applied to the hull of a vessel; Fig. 2 shows the bath for copper coating the keel, and Fig. 3 a method of forming a water tight joint between the tank and vessel.

In these drawings A is the hull of the vessel, B the baths applied to the side, and N N^1 the electric conductors, C in Fig. 3 being a tubing which forms the water tight joint between the edges of the bath and the side of the ship.

Any form of elastic packing can be used to make the bath water tight where it touches the iron hull of the vessel. The frames of the bath are made flexible, and may thus be bent to suit the curved lines of the ship at various points, and special baths are constructed to embrace the keel, as shown in Fig. 2, and for complex ins faces like the stern bearing and rudder post. It is very evident that the construction here shown may be modified considerably without departing from the principles underlying the system.

Somewhat extended experiments have shown that the copper can be deposited so as to perfectly cover the hull, and that it will cling with such tenacity to the steel as to make its removal impossible without destroying it. Concerning the rate and cost of depositing copper of suitable thickness by this method, it has been calculated that any number of baths 4 x 10 feet may be operated simultaneously in 70 hours' time with an expenditure of 6½ horse-power for each bath. Upon a vessel 400 feet long 60 baths can be operated at once in three rows on one side, with 390 horse-power; or 120 baths, 60 on each side, can be operated at once with 780 horse power, at a cost per day of $150. It is stated that the whole bottom of a ship drawing 20 feet of water can be plated from the water line down complete in eight or nine days by using 60 baths at once on each side, with 780 horse-power, shifting the baths two or three times. The plated surface of such a vessel would aggregate 24,000 square feet and require 55,500 pounds of copper, which, at 12 cents a pound, would cost $6660.

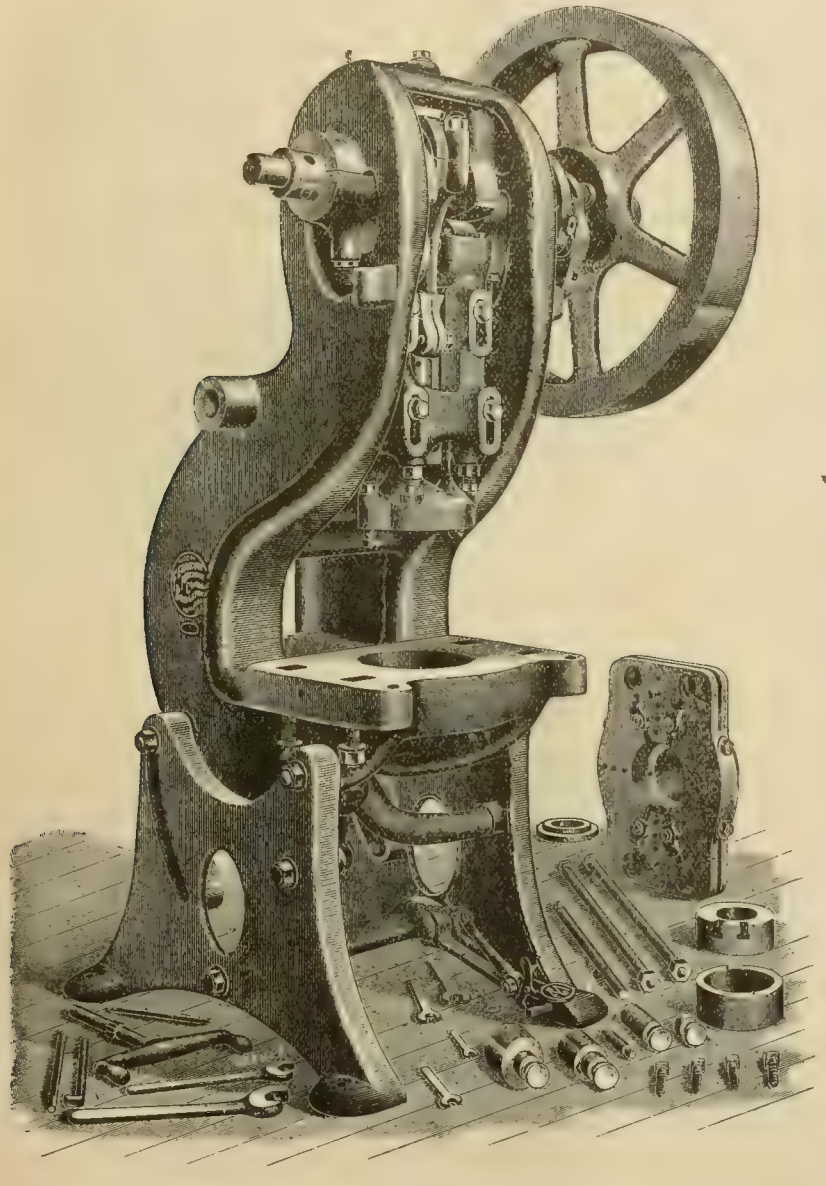
COPPER COATING THE HULLS OF VESSELS BY MEANS OF ELECTRICITY.

Inclinable Drawing Press.

This Ferracute inclinable drawing press differs materially from the one by the same makers, the Ferracute Machine Company of Bridgton, N. J., from designs by Oberlin Smith, which was illustrated in *The Metal Worker* of September 30. This machine is built with a frame so mounted upon its legs as to be quickly inclinable to any desired angle by a convenient elevating screw, and proper clamping nuts for securing the same.



INCLINABLE DRAWING PRESS.

Its weight is 4700 pounds and its dimensions, &c., as follows: Round hole through bed, 10 inches; throat from ram center back to frame, 9 inches; hight bed to ram, with ram up, 12 inches; stroke of ram, 2½ inches; adjustment of ditto, 3 inches; hight bed to plunger, when up, 17 inches; stroke of plunger, 5 inches; adjustment of plunger, 3 inches; fly wheel, 42 x 6 inches; and weight of same, 1150 pounds; speed of fly wheel, 180 revolutions per minute; thickness of bolster, 3 inches; and round hole in same, 7¼ inches; pressure safely exerted by ram, 52 tons; maximum diameter of work, 7 inches; and depth, 2 inches; maximum blank diameter, 11 inches.

The spring ram lifter is arranged with an equalizing lever, so that the lifting is practically equal all the way up, together with a positive lifting device connected with pitman so that the cams cannot leave the rollers in case the spring lifter should fail.

The ram has a very large hole for deep punches to pass up into, and yet has solid metal to which the upper dies may be fastened by the hooked clamps provided, together with a plunger having a large and long hole for shanks of punches, with a locking arrangement which moves them positively up and down, but allows sufficient play so they may enter their dies accurately and centrally, while at the same time leaving room to put in bushings to fit various odd punches which may be required.

The bolster is provided with a deep and heavy truss extending down into the bed of the press so that it may remain perfectly flat and yet can be tipped slightly out of level at its different corners by four sliding wedges driven by screws and nuts, while at the same time its thin and elastic edges are firmly clamped to the bed of the press, thus enabling dies to be accurately aligned to each other to prevent wrinkling of work.

A pair of stay rods are furnished which can be quickly inserted in the frame, thus making the press nearly as stiff as a straight column press, upon certain occasions where great rigidity is required, and where it is not necessary to pass long sheets through sidewise, as is usually done in throated presses.

An automatic stop clutch and clutch plate carrying the tripping device are provided as in the press previously described. The four hardened wheel studs for driving in the hub of the fly wheel, and the self-acting locking pins, are of the same design as in the other press. Three smaller and two larger sizes of presses of this same design are also built.

Tests of Aluminum Cooking Utensils.

A correspondent of the London *Ironmonger* mentions some interesting experiments which have been made at the instance of the French military authorities in order to ascertain to what extent aluminum is serviceable for kitchen utensils and the like. The results, on the whole, are said to have been exceedingly satisfactory. The tests were made with plates 0.04 inch thick, with an area of 7 square inches, which were for some length of time exposed to the influences of various liquids. These comprised, besides the beverages generally used by the soldiers, various acids, and the experiments extended in some cases over a period of four months. The plates were carefully weighed and cleaned prior to the testing and again weighed after its cessation. Any deduction in weight indicated how much the plate had suffered. A plate weighing ⅛ ounce which had been inserted in claret containing 9½ per cent. alcohol for four months had lost 0.108 grain. The plate appeared none the worse, nor had the claret, which had been kept well corked, changed its taste. Beer and cider gave the same result, and the loss in weight by exposing aluminum to coffee, sugar and milk was entirely insignificant. Cotton oil had no effect whatever, and butter which was several times heated certainly darkened the metal somewhat, but there was no perceptible loss in weight, and the discoloring was easily removed. Soup of various kinds had no effect. Finally, the aluminum was exposed to the influence of the air and the earth; in the air there was no effect; having been placed underground in a damp garden for a couple of months a plate of ⅛ ounce had lost 0.062 grain.

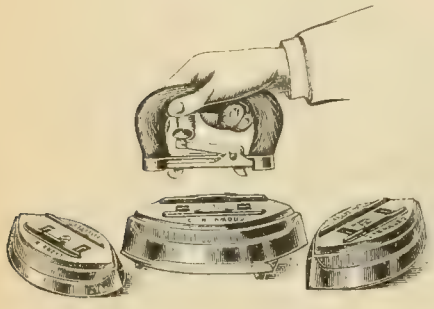
The results have proved that aluminum is very well adapted for kitchen utensils, &c. Air, water, wine, beer, coffee, milk, oil, butter, fat, earth, &c., have less effect upon it than upon iron, copper, lead, zinc and tin. Vinegar and salt attack aluminum a little, but not to such an extent as to affect its suitability.

Augustus R. Hall of the firm of Hall & Carpenter, tin plate and metal merchants of Philadelphia, died at his home in that city on Saturday, October 7. Mr. Hall at an early age entered the firm of N. & G. Taylor, taking control of the sales department. In 1867, in conjunction with the late Mr. Carpenter, he founded the well known firm which bore his name. On the death of Mr. Carpenter in 1883 Mr. Hall continued the firm as sole proprietor. He was an active member of the Masonic order, of the Board of Trade, Commercial and Maritime Exchanges, the Union League and the Historical Society of Pennsylvania.

THE RETAIL STORE.

Crown Sad Irons.

The cut herewith given represents improvements in Crown sad irons, as manufactured by Colebrookdale Iron Company, Pottstown, Pa., whose New York office is in charge of Duncan K. Major, 103 Reade street. The handle



Crown Sad Irons.

is made from selected apple wood, worked out by machinery, and neatly finished. The handle is adjusted by raising the knob with the finger, while its shape is such as to adapt it nicely to the hand. The point is made that the construction of the handle obviates any looseness and rattle. The irons are plain polished and nickel plated, finished in gilt, and are packed three irons, one handle and a stand to a set.

Sporting Goods in the Hardware Store.

BY R. T. PALMER.

The profits from the sale of sporting goods has led wide awake Hardwaremen to pay greater attention to these lines, and the number who have laid them in during the past few years has greatly increased. There are many places, however, where these goods are not kept in sufficient variety and quantity to do these lines justice. One great aid in purchasing goods suitable to the local trade, and in disposing of them, is the sport-loving proclivity of the merchant himself. From his own indulgence in hunting and fishing he will better understand his brother sportsmen's wants, and it will teach him to avoid burdening himself with unsalable and inferior articles, which in time accumulate into worse than useless stock.

He will be alive to the merits of novelties which are constantly coming on to the market and by providing them will convey to his customers the idea that he is headquarters in his line.

Another most important aid is an early and

SEASONABLE DISPLAY,

not a heterogeneous mingling of all sorts of Hardware with sporting goods —but a window tastefully decorated containing a solid display of Tackle in the early spring just before the opening of the season, with perhaps a display of the same a few weeks later, and an exhibit of Guns and Gun goods in and during the fall.

SOLID DISPLAYS

always attract and hold attention, and no windows are more interesting to man and boy alike than those containing paraphernalia which bring up to the memory instances of boy life.

PRIZES.

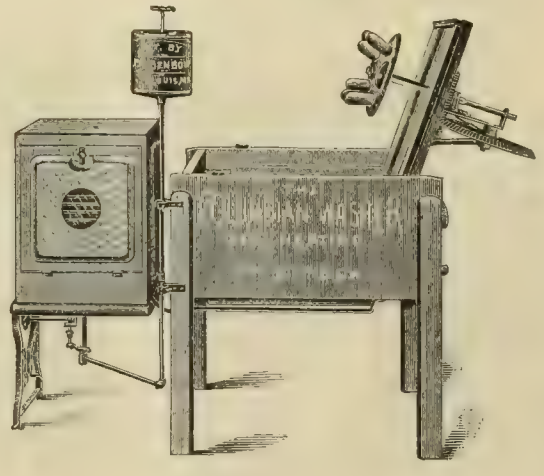
In many instances to stimulate fishermen's enthusiasm and rivalry dealers have with much success offered prizes for the largest bass and trout caught during the season, same to be weighed in the dealer's store, while the first bird of the season has become traditional. In smaller cities lawn tennis can be laid in to advantage, more especially so if the dealer associates with those among whom the game is popular. These goods are ordinarily handled with baseball goods by the book stores, and it may often be wiser not to intrude.

BICYCLES

are essentially a part of the Hardwaremen's stock and are deservedly receiving more attention from the trade. While in the Tackle and Gun lines it is necessary to carry in stock cheap-priced articles for a class of trade who cannot be induced to buy higher grade goods, yet it is always policy to sell a man as good an article as he can be persuaded to buy, even at a less ratio of profit, as a well-suited customer is always a good advertisement, and in nothing, perhaps, as much as in sporting goods. It is good policy in any branch of merchandising to exhibit interest in your customer, but particularly so in the success of your customer with his Rod and Gun.

The Columbian Washer.

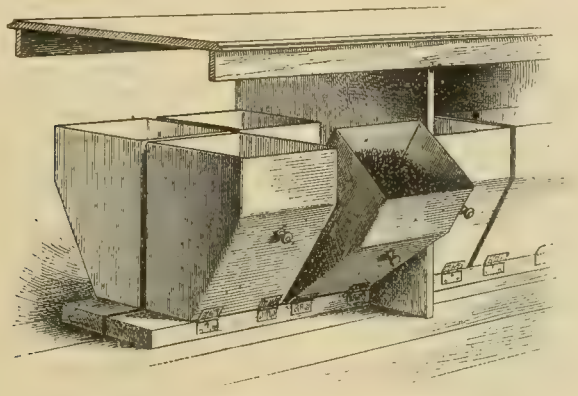
The Columbian Washer, as shown herewith, is being introduced by P. T. Benbow, 1814–1816 North Eighteenth street, St. Louis, Mo. The pin wheel is malleable galvanized iron, with a galvanized shaft turned out of wrought iron. The shaft, it is remarked, regulates the pin wheel to the amount of clothes in the washer, by playing up and down through the small gear wheel above the lid, so that there is no shaft below the pin wheel to entangle the clothes, causing the machine to work hard. It is stated that the pin wheel will not wear out, as hot water cannot affect it; and that the bearing through the small iron gear that the shaft plays through is 2 inches long, so made as not to wear out. The holes in the pin wheel are made flaring, so that the pins are firmly wedged to prevent them coming out even when they get dry. The bottom of the washer is of galvanized iron, put on with white lead and packing. There is also a corrugated false bottom, which is raised from the main bottom, leaving a space for dirt from the clothes to settle in, instead of being ground into the clothes; admitting of the suds being used longer. The false bottom lifts out so the machine may be cleaned. Heavy three-cornered blocks are fastened in each corner of the washer, underlaid with white lead to strengthen the box; and corrugated strips are used on the sides of the washer, placed a little apart, so as to prevent them from bulging and splitting when wet. The gasoline burner swings under the washer, where there is a flame protector, to keep the flame from being blown out. The water is heated in the washer, and the burner may be swung under the stove for making starch, heating sad irons, or for cooking and baking. The washer is sold with the gasoline stove attachment.



The Columbian Washer.

Tipping Nail Bins.

We are indebted to Charles M. Norton of Lansing, Mich., for the design of Nail Bins shown in the cut—bins similar to which he has had in use for some time. He does not claim to be the originator, as the design was borrowed from Newman & Kennedy of Portland, Mich. Each bin is 14 inches high, straight at the back. In front the straight part is 3 inches high, and the slanting part 11 inches high. Each of the four sides measure 16 inches at the top, while the base is 6 to 8 inches wide and 16 inches long. The bins stand on a plank 2 inches thick, to which they are hinged



Tipping Nail Bins.

to tip forward. A base knob is attached to the front of the bin, so that where the bin is tipped forward it is held up from the floor, thus permitting the scoop to go under the front edge when taking out Nails. Two rows of bins were placed under a counter back to back, one row holding Cut and the other Wire Nails. This construction of bins has been found to work very satisfactorily.

A Merchants' Local Association.

BY F. H. WOODWORTH.

In recent years there has been a marked tendency on the part of manufacturers to effect associations, combinations, trusts, &c., and in most instances their efforts have been quite successful. Why, then, should not merchants follow in the same line? The time has come in this country where the keen blade of competition cuts such a wide swath that merchants of small or moderate means are almost handicapped by being thrown into competition with large concerns.

The tendency generally on the part of

LARGE HOUSES

is constantly to cut prices rather than to hold them up on a profitable basis. They are jealous of their smaller competitors and frequently would rather give the customer the benefit of their profit than to allow the competitor to make a sale. A great deal of rivalry exists and this rivalry tends to lower prices and demoralize trade.

THERE IS A REMEDY

which, when properly administered, will effect a complete cure, especially among the Hardware merchants—viz., local associations of dealers. I have been a firm believer in this policy for several years, and have endeavored on various occasions to convince my competitors that we would all be very much benefited by an organization of this kind. Finally, after considerable effort, the Hardware merchants of our city (consisting of seven houses) had a meeting one night in March, 1893, and effected a permanent organization, and I am glad that I can speak from experience at this writing.

OUR ASSCCIATION

here has been in existence now for the past six months, and the older it grows the more each member is pleased with it. We all feel benefited, and instead of looking upon one another as competitors we regard each other as friends. We meet regularly every Monday night for the transaction of any business that may be brought before the association. These regular meetings tend to keep up an interest in the association, and, for my part, it is one of the most pleasant evenings I spend during each week. Prices have been regulated and placed on a profitable basis, cut throat business has ceased and petty jealousies have entirely disappeared. We have

CONFIDENCE

in each other instead of distrust, and although business has been very much depressed during the past few months, we have the satisfaction of knowing that we are making a living profit on what goods we sell. Again, I must say that I heartily favor the local association of Hardware merchants, and feel confident that Hardware merchants all over the country would be much benefited by such organizations when properly conducted.

Automatic Steam Coffee Cooker.

Wilmot Castle & Co., Rochester, N. Y., manufacture a coffee pot on the same principle that is embodied in their Arnold automatic steam cooker. Fig.

Automatic Steam Coffee Cooker.—Fig. 1. —General View of Coffee Pot.

1 of the accompanying cuts shows a general view of the pot, while Fig. 2 shows a sectional view through the pot and the steam cooking attachment. It is pointed out that coffee cooked with steam at an unvarying temperature of 210° cannot boil, and it is therefore much better and more wholesome. The steam generated in the tin vessel under

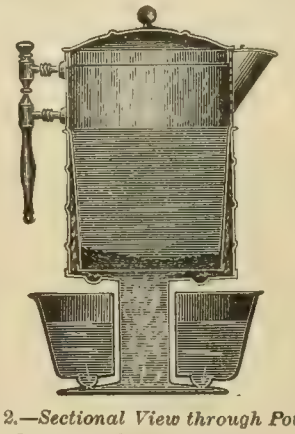


Fig. 2.—Sectional View through Pot and Steam Cooking Attachment.

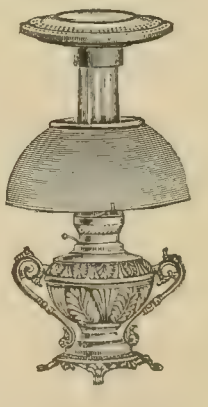
the pan rises around the coffee pot and drips back into the reservoir. Extra pots are used for tea, which, the manufacturers claim, should be prepared in the same manner. Urns for boarding houses and small hotels are also made on the same plan.

The Merrill Heater.

Among the lamp stoves which are at present on the market that recently



The Merrill Heater.

brought out by Randall & Becton of 19 India street, Boston, Mass., is worthy of more than passing notice. It is known as the Merrill and is illustrated in general view in the accompanying

cut. From an inspection of the engraving it will be seen that, generally speaking, the device consists of an ordinary fountain lamp, on the top of the chimney of which is supported a shallow drum formed of two dished disks, joined at their outer edges and presenting the appearance shown. The top disk is perforated near its outer edge with nearly 300 small openings for the discharge of the heated air. The material employed is aluminum, which does not tarnish with use and which greatly resembles silver in its appearance. The lower disk is made of nickel plated brass with an opening for the introduction of the chimney top and is corrugated so as to allow for expansion and contraction. The drum is suspended upon the chimney top by means of hooks, which can be adjusted to suit varying sizes. A nickel plated collar loosely incloses the top of the chimney and permits the entrance of cool air into the drum, thus increasing the circulation. The manufacturers state that the device will not break chimneys nor cause soot or smell. They also claim that by the use of the Merrill heater the current of air is retarded in its upward progress, superheated and discharged in tiny streams into the surrounding atmosphere. The principal object of the construction employed is claimed to be the warming of the greatest volume of air in the shortest possible time.

Brad Brackett.

Brad Brackett kept a wholesale store
Under the Spring hoe-tel;
And though his ware was in demand
It was hard ware to sell.

His stock of staple goods was on
A scale you seldom find;
Including pokers, shovels, tongs,
Andirons of that kind.

Although a skillful financier,
He would not gouge in trade;
Nor chisel any one a bit,
If ne'er a cent he made.

A plane and quiet man, he ne'er
Was known to stirrup strife;
A firmer friend one never saw
En-gauge in business life.

Possessed of hinge-enuity,
That compasses one's ends,
He did his business on the square.
And had a host of friends.

'Twas not by any ax-ident
He rose above the rest;
The key to his success was that
He did his level best.

Nobody had a stronger faith
In printers' ink than Brad's;
He used to say he carved his way
To fortune with his adz.

He always paddled his own can-oe,
And, pulley as he might
Against the stream or with the stream,
Was sure to come out right.

Of being a strong partisan
He had the reputation;
But, rather than support bad men,
He'd bolt a nomination.

As a tack-tician he excelled—
In auger-nizing led—
Though screw-pulous, was sure to hit
The nail upon the head.

He deprecated rings and frauds,
And scorned a party tool;
In politics, religion, trade,
He observed the golden rule.

He was no misanthrope, but took
A file-anthro-pick view
Of life, with its vice-cissitudes,
As all of us should do.

A splendid "catch," he lived a bach,
Anvil-age belles were told,
They tried in vain his heart to gain
With beauty or with gold.

Though a teetotaler, he kept
The best of bars, 'tis true,
Where one could get his "nippers" and
All kinds of punches, too.

But fickle fortune chain-ged at last,
And caster threatening pall
O'er him, and with one fatal wrench
Deprived him of his awl.

His locks by sorrow's weight were turned
To silver, and were long;
He fell before the scythe of Time
To join Death's mighty throng.

The Cream City Flour Bin and Sifter.

Geuder & Paeschke Mfg. Company, Milwaukee, Wis., are offering a flour bin and sifter, as herewith shown. The bins are made of tin on improved machinery especially built for their production, handsomely ornamented to make them attractive as well as useful,

The Cream City Flour Bin and Sifter.

and each is packed in a separate package, strong enough, it is stated, to insure safe delivery at any distance from the factory. Notable among the features of the bin is a detachable shield, designed to protect the sifter from pressure by the weight of the flour, but to allow a sufficient quantity to pass through to insure quick and easy sifting, at the same time to obviate all grinding through of foreign substances. The bins are recommended by the makers as of more than ordinary merit, the sale of which will be found satisfactory and profitable.

Self Cleaning Filter.

Henry S. Smith, Chadwick, Ill., is offering a self cleaning filter for cisterns, which obviates the use of charcoal and gravel. The filter consists of a rectangular tin box, within which is a cut off, and three wire screens one above the other, the top one coarse, the next one finer and the lower one finer still. At one side of the filter is a conductor pipe, open on the side next the filter, and so arranged that the water can be turned, by the use of the cut off, into the conductor, or caused to pass through the screens into a separate outlet to the cistern. The screens slope somewhat toward the conductor at the side of the filter, to allow the accumulated filth to wash off and be carried to the ground. The cap covering the filter and conductor can be slid up to allow the screens to be removed. On the top of the cap is a collar corresponding in size with the down spout to which the filter is to be connected.

TWO OF THE HARDWARE DEALERS at Fort Edward, N. Y., offered stoves as prizes at the county fair for those who guessed nearest the correct weight. Mr. Bowtell offered a Gold Coin range, which was drawn by John Bickley of Glens Falls, and Newton & Hill offered a Princess Acorn at the Washington County Fair, which was drawn by Mrs. Margaret Durkee of Fort Edward.

Gersdorff's Improved Standard Funnel.

J. Hall Rohrman & Co., Philadelphia, Pa., are putting on the market Gersdorff's Standard funnel in an improved form. The improvement consists in the overflow ring, which is now spun on to the top of the funnel, instead of being soldered on, as in the old style. The funnel is made of three pieces of sheet copper or tin, seamed from the top to the center, and soldered from the center to the nozzle, with an overflow ring at the top. The nozzle is shaped triangularly, so that when in use the funnel rests firmly in the neck of a receptacle and makes three perfect vents for the escape of air during the process of filling. The funnel has a strainer so arranged as to be readily removed when required. The makers claim that they can now produce it at a price not exceeding that of an ordinary first-class funnel.

P. J. Davy, agent for the Magee furnace at Niagara Falls, N. Y., is placing one in the residence of Patrick Mocklar of that city.

Two Notable Canals in Europe.

The canal across the classic Isthmus of Corinth, in Greece, which was commenced on March 27, 1882, is now approaching completion. It is announced that it will be formally opened on April 23. The work is a little over 3½ miles long, 68 feet wide on the bottom, 80 feet wide at the water line and 26 feet deep. It will connect the Gulfs of Athens and Corinth and greatly shorten the voyage from Adriatic ports to those in the Levant and Eastern Mediterranean. The original calculation for the work put the excavation at about 14,000,000 cubic yards, and the first capital was $6,000,000, to which $2,800,000 more had been added by July, 1889, when the works came to a standstill on account of lack of funds. A new company was then formed to finish the canal, with a capital of $1,000,000 in shares and $4,666,700 in obligations, of which about four-fifths have been issued. This company have so far completed the work that the opening is announced as above. Meanwhile an even more important work is going on in Northern Europe in the ship canal between the North Sea and the Baltic, which, we are told, is being pushed on with such energy and regularity as to give good hope of its being finished in 1895, as originally intended. One hundred and seventy-three million cubic feet of excavations have already been made, and some of the locks are nearly finished, while the banks are being lined at several points. On account of the increasing size of vessels the width is now to be 218 instead of 200 feet, and the depth 30 instead of 27 feet, while the number of pass-bys is being increased so as to facilitate the navigation, these improvements necessitating a large increase in the estimated quantity of excavation. The terminal locks at Kiel and on the Elbe are to be made double, and both of them provided with two entrances.

STOVE TRADE NOTES.

Future of the Hot Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

THE FURNACE TRADE FOR 1894.

An enterprising furnace dealer from an Iowa town called on me recently, and, in discussing the outlook, stated that, while he expected a fairly good fall trade, he did not anticipate selling a single furnace in the year 1894. Being asked for an explanation of this very pessimistic view, he said that, in his opinion, the financial stringency would lead to a total cessation in the line of building throughout the country, and that, with no new buildings going up, there would, of course, be no furnaces sold during the coming year. He was then asked how many furnaces he had placed during 1892, and replied that he had sold nearly 40 ; and on analyzing the sales of that year, it was found that over 30 were placed in new buildings and nearly 10 in old houses, churches, stores, &c., or nearly 25 per cent. of the total sales were for buildings erected in previous years, and for which no provision for heating, other than by stoves, had been made.

These facts gave me an opportunity for an argument with my furnace friend, which I embraced, and I called his attention to the possibility of making the year 1894 the banner one in the history of his furnace business. In almost all growing towns and cities improved heating apparatus is installed, as a rule, in the new buildings which are erected, and dealers devote their spare time to looking up and canvassing this trade, as each new building yields to the dealer a good business in building paper, nails, spouting, roofing materials, paints, builders' hardware, heating apparatus, &c., and the trade in the way of furnaces that he gets from the owners of old buildings comes to him unsolicited. In each Western town there are doubtless at the present time a very large majority of the houses of the better class unprovided with improved heating apparatus, and here is a field for the enterprising furnace dealer to develop in 1894 if the construction of new buildings is to cease. Each winter sends to the junkman a goodly number of parlor stoves which have outlived their usefulness, and the past winter being one of unusual severity, it is fair to suppose that the number of stoves ready for the scrap heap this spring was greatly augmented, but the wave of economy which is spreading over the land will lead to the repairing of these crippled parlor heaters, and they will be made to do duty for one more winter, but in 1894 they will be consigned to their fate.
